THE COMMON WELFARE

UNCLE SAM'S HEALTHIEST YEAR

Preliminary reports of the forthcoming bulletin of the United States Bureau of the Census on Mortality Statistics for 1909, compiled by Dr. Cressy L. Wilbur, chief statistician for vital statistics, indicate that 1909 in the United States was the healthiest year of which any record has been kept. The death rate for the registration area was 15 per thousand as against 15.4 in 1908, and as against an average of 15.9 for the quinquennial period 1901 to 1905.

The registration area in 1909 comprised 55.3 per cent of the total estimated population of continental United States as against 51.8 in 1908. The estimated population for this area for 1909 is 48,776,893. The bulletin on mortality for 1909 was delayed until the official population figures for 1910 were available. In the light of these census figures all estimates of death rates in the 1909 report have been revised, thus correcting the rates in many cities. The total number of deaths was 732,538, an increase of 40,964 over 1908. Of this number, 54.4 per cent were males, as compared with 54.3 per cent in 1908. March, as usual, showed the greatest number of deaths.

The leading cause of death in 1909 was tuberculosis, from which 81,720 deaths occurred, or 11.15 per cent of the total mortality. The death rate from tuberculosis was 167.5 in 100,000, a decline of 6.4 from 1908. The Census Bureau says this is the lowest rate on record for the registration area, although it should be remembered that the addition of Ohio in 1909, with a low rural mortality from tuberculosis, would tend to depress the death rate for the entire registration area. It is remarkable, however, that the aggregate of registration cities, which is not affected by transfers from the group of cities in non-registration states to the group in registration states, shows 54,461 deaths for 1909 or practically the same number as for 1908, which was 54,466, a decrease of only 5 deaths.

The death rate from cancer shows an apparent increase from 74.3 in 1908 to 77, and an increase in the number of deaths from 33,465 to 37,562. The fact that cancer is one of the diseases having a peculiar age distribution warns one to be cautious about drawing too many conclusions from this crude rate.

Typhoid caused 10,722 deaths in 1909, or 653 less than in 1908. The rate fell from 25.3 to 22 per 100,000. This is the lowest rate since 1900, and is nearly one-third less than that for the five year period 1901-1905 (32.2). It is still, however, twice as large as that in England and Wales, showing that there is much preventive work to be done in reducing the mortality from this disease.

Influenza, or "grip" showed a large decrease, from 9,989 deaths in 1908 to 6,649 in 1909. The Census Bureau considers this remarkable, since bronchitis and pneumonia, diseases classified under respiratory diseases but usually closely associated with influenza, showed, for bronchitis about the same number of deaths, and for pneumonia a marked increase for 1909.

Pneumonia, in the aggregate, caused more deaths than other diseases, except tuberculosis. The number increased from 61,259 or 136 per 100,000 population, in 1908, to 70,033 or 143.6 per 100,000 population, in 1909, being only 7 less than the number, 70,040, from tuberculosis of the lungs. The rates, however, for both years were lower than for any previous year of the decade.

Among the causes of accidental deaths, in the order of numerical importance for the year 1909, were the following: Railroad accidents and injuries, 6,659; drowning, 4,558; burns and scalds, 3,992; injuries at birth, hereafter to be classified under diseases of early infancy, 3,508; injuries by horses and vehicles, 2,152,

not including injuries by street cars, 1,723, and automobile accidents and injuries, 632; injuries in mines and quarries, 1,997; inhalation of poisonous gases, including conflagration, 1,837; other accidental poisoning, 1,779; accidental gunshot wounds, 944; heat and sunstroke, 816; cold and freezing, 251; lightning, 150. There were 1,174 fatal injuries by machinery, chiefly in factories, but the large number, 10,108, of accidental traumatisms of unspecified nature makes it necessary to consider many of the figures given above as only minimal. There were also 2,854 deaths from homicide or 149 less than in 1908, and 8,402 deaths of suicide, as compared with 8,332 the year before.

Of the total number of deaths in 1909, 732,538, no less than 196,534, or 26.8 per cent, were of children under five years of age, and 140,057, or 19.1 per cent, were of infants under one year of age. In general, one death out of five during the year 1909 was of an infant under one, and a little more than one death in four, or about 27 per cent, was of children under five. The registration cities showed slightly higher and the rural part of the registration states slightly lower proportions than those for the registration area as a whole. The proportion of deaths of children under five to the total deaths in the year is far greater than that of any other five-year period.

THE HINDU, THE NEWEST IMMIGRATION PROBLEM

Pacific coast states are suddenly awakening to a new immigration problem in a rapidly increasing influx of Hindus. It is reported that over 5,000 of them entered the port of San Francisco during the past twelve months. The

A NEW IMMIGRANT PROBLEM.

pictures upon this page, sent to THE SURVEY by Rev. George E. Burlingame of San Francisco, show typical groups on the steamship Nippon Maru on her arrival at San Francisco late in August with nearly one hundred Sikhs from the Punjab.

Travelers along the Pacific coast states are impressed by the appearance of these white turbaned newcomers. British Columbia seems also to be receiving a large number and it is a common sight to see them on the streets of Vancouver. A large number arriving at San Francisco settle in the Sacramento valley of California. They come to America to work in lumber camps and on railroad construction.

The same sentiment on the Pacific coast which opposes Japanese immigration is developing quite as strongly against the Hindus, and organizations

HINDUS ARRIVING IN SAN FRANCISCO.

have been formed to restrict and if possible prevent the admission of an element which is felt to promise little of advantage and much of difficulty to far western states. Many are already being turned back at quarantine to whom admittance was refused under the Immigration Bureau regulations. According to Mr. Burlingame's observations, two problems are obviously involved in this new phase of foreign invasion. The civic and social question concerns the ability of the nation to assimilate this class of Hindus and their probable effect on the communities in which they settle. Their habits, their intense caste feeling, their lack of home life—no women being among them—and their effect upon standards of labor and wages, all combine to raise a serious question as to whether the doors should be kept open or closed against this strange, new stream. The other question concerns the welfare of the thousands who are already here and the communities in which they have settled. This is likely to put to a severe test the civic and religious forces which are faced with the new duty of Americanizing and evangelizing them.

Surely the first need, however, is an adequate investigation, so that we may know the extent and conditions of this new immigration problem.

WOMEN CHAINMAKERS REFUSE TO BE SWEATED

The first attempt to apply the new English trades boards act, described in THE SURVEY of January 29, has been the occasion of a strike followed by the lockout of 500 women chainmakers. The enquiry of the House of Lords, in 1887, into the sweating system showed this trade to be the worst of the home industries. At Cradley Heath, where the lockout is now going on, women, for the most part mothers of families, work twelve hours a day hammering heavy chains by hand over crude forges in their shanty homes. For this work, which requires skill as well as most exhausting labor, the pay is from one and one-half to three pence an hour, and the usual weekly earnings are from five to six shillings. The larger employers pay, as a rule, the higher rate, but in this trade as in the tailoring trade in America, only a small investment of capital is necessary to start in business and the result is a number of small bosses, who take advantage of unrestrained competition among the workers to pay starvation wages.

On August 22 the Wage Board set the minimum pay at three and one-half pence an hour, but the act of January provided that, with the consent of the workers, a six months' extension of time could be allowed the employers before the new scale went into effect. The Cradley Health workers were asked to sign an agreement to this effect and most of them did so, as they now claim without any knowledge of its contents, as the majority could not read and only knew that the paper was in some way connected with the new scale. They soon realized their mistake, however, and they claim also to have found that the masters were forestalling, heaping work upon them so that when the new scale of wages went into effect a slack season would ensue. Two hundred women refused to continue work at the old rate. The Woman's Trade Union League took hold of the situation and sent Mary MacArthur to Cradley Heath, and as the Trade Union Federation has undertaken to pay a weekly strike benefit of five shillings, as much, that is, as many of the women were earning, the number soon rose to 500 and there is every reason to believe that the four hundred chain hammerers not yet out will join the ranks of their sisters. The Masters' Association has the letter of the law on its side, but as the public and some of the better employers have been on the women's side from the beginning there is a very good chance that they will win.

NATIONAL FIGHT ON BABY KILLERS

The country has rallied quickly and struck some telling blows in the fight against baby-killing drugs, following the first gun—the now famous report of Dr. Wiley of the Federal Department of Agriculture, on patent medicines, beverages and other preparations containing habit-

forming drugs. The list, which was printed in THE SURVEY for June 18, exposed many "soothing syrups" and "teething powders," and these were quickly made the objects of a special attack by many of the most influential newspapers in the country, which published them widely under the heading "Baby Killers":

Mrs. Winslow's Soothing Syrup (morphine sulphate).
Children's Comfort (morphine sulphate).
Dr. Fahey's Pepsin Anodyne Compound (morphine and sulphate).
Dr. Fahrney's Teething Syrup (morphine and chloroform).
Dr. Fowler's Strawberry and Peppermint Mixture (morphine).
Dr. Groves' Anodyne for Infants (morphine sulphate).
Hooper's Anodyne, the Infants' Friend (morphine hydrochlorid).
Jadway's Elixir for Infants (codein).
Dr. James' Soothing Syrup (heroin).
Koepp's Baby's Friend (morphine sulphate).
Dr. Miller's Anodyne for Babies (morphine sulphate and chloral hydrate).
Dr. Moffett's Teethina Teething Powders (powdered opium).
Victor Infant Relief (chloroform and cannabis indica).

In New York city, Health Commissioner Lederle is taking aggressive steps. The New York situation was strikingly brought out by an experience a New Jersey lawyer recently had in New York city. He had a druggist and his customer arrested for selling and buying morphine without a physician's prescription, only to find that New York had no law like that in New Jersey forbidding such unregulated sale. Since then the Board of Health has made a ruling forbidding the retail sale, except upon the prescription of a physician of morphine or the salt of morphine, cocaine or the salt of cocaine, either alone or in combination with other substances. The druggists at first were in some doubt as to whether soothing syrups, expectorants, consumption cures and other so-called remedies were included. Commissioner Lederle, however, has directed the strict enforcement of the amendment to the regulations, although a delay was requested until the arguments on the subject had been considered.

The secretary of the Metropolitan Association of Retail Druggists, which includes a third of the drug stores, states that the members voluntarily stopped the sale of soothing syrups and any drug that contains morphine, codeine or heroin. The secretary favors a strict interpretation of the ruling. A large corporation having a chain of stores throughout the city is advertising a list of preparations it refuses to sell without prescription. The list includes paregoric, syrup of white pine, Mrs. Winslow's Soothing Syrup, Jackson's Pectoral Syrup, Chlorodine, and Sun Cholera Mixture.

Philadelphia has taken some practical steps toward the abatement of the evil. At the instigation of Doctor Newmayer, head of the infant mortality division of the Bureau of Health, the Philadelphia Association of Retail Druggists has adopted resolutions condemning the sale of a selected list of the nostrums. The doctors of the bureau have found, as a result, that the drug stores in most cases are refusing to sell the medicines named above without prescriptions.

The health authorities intend to follow up this step by prosecuting unlicensed practitioners, who sell patent medicines. Mothers are to be taught that it is not necessary to administer drugs every time their babies cry. The city doctors and nurses explain how often the trouble is due to clothes that bind too tightly, to thirst, lack of sleep, or irregular feeding.

In Chicago the Civic Federation has conducted a systematic campaign of educational publicity on the subject. Posters blossomed forth in bright colors on walls and fences, articles were contributed to the foreign press of Chicago, the Health Department supplied much material in its weekly bulletin. Besides the co-operation of the clergy, nurses and field workers of the United Charities, and the social settlements the park boards aided by displaying posters and distributing cards to the mothers themselves.

The campaign against the nostrums must include positive educational work to be effective. Mothers are taught the value of clean milk, cool boiled water, and general cleanliness, as a part of the usual summer work for babies in many cities. City authorities all over the country have

been quick to use in their health activities the ammunition against soothing syrups, supplied by the national government.

CITIZENS' CAMPAIGN WAGED IN ILLINOIS

The first battle in the "irrepressible conflict" for the recovery of representative government in Illinois had what the newspapers called a whirlwind finish. The citizens woke up late to the realization of how far they had lost control of their Legislature. As previously described in THE SURVEY[1] they fell back upon the right of free assemblage, and started to face the worst and do their best.

Although their awakening was too late to effect decisive results at the direct party primaries, in defeating the worst or nominating enough better men for the Legislature, yet there was time to make the beginning of an end of the deeply entrenched bi-partisan conspiracy which has so long misruled and disgraced the state. State organization was given the Legislative Voters League, hitherto composed of Chicago citizens and largely devoted to electing better representatives from Cook county. By the co-operation of advisory committees throughout the state it was able to report to the voters in every district, its findings and recommendations concerning every legislative candidate. While there was no hope of at once overcoming the gangsters' advantage in their hold on party organization and in the legal right of their adherents to "plump" three votes for one candidate, yet the issue was at least squarely lodged with the citizens of the state, so that they will be forced to face it from now on both at the primaries and at the elections. They have already repudiated sixteen bi-partisans who misrepresented them and may retire more at the polls in November.

But the plan of campaign aims far beyond any attempt to change office holders either at the next or succeeding elections. It purposes to change the method of legislative procedure. Taking advantage of the advisory public-policy referendum law to agitate and educate the people to this further end, the Committee of Seven dared to initiate the long and laborious effort for constitutional amendments to secure direct legislation, to extend the civil service system, and to penalize corupt practices. The initial step required 110,000 voters' signatures to a petition for a popular vote on the question whether the Legislature should pass these measures, subject to the ratification by the people at the polls.

Only thirty days before this petition had to be filed, the committee undertook the arduous task of securing these signatures from all parts of the state. The members had neither money nor organization. They had to depend on volunteer help. Not half of the names had been secured a week before the petition had to be filed. Then the last dependence was upon American pluck and the energy of Western enterprise. Assurance could be made doubly sure only in Chicago. Petition wagons were kept at the corners of the most crowded streets to get passers-

A "PETITION WAGON" IN CHICAGO.

[1] THE SURVEY, September 2, p. 750. Lincoln's Soul Goes Marching on to Illinois.

by to sign from the sidewalk. Around these extemporized standing desks, which were projected over the wheels just beyond the curbstones, citizens thronged all day long for several days. Powerfully supplementing this device, three of the great newspapers and some smaller journals printed the petitions with blank spaces for signatures, requesting the voters to sign, clip and forward. When they were gathered up, just in time for filing, these interesting results attested the people's first response to the appeal for what the newspapers called "decency": There were 133,846 petitioners for the extension of the civil service; 134,010 for a corrupt practices act; and 137,268 for the initiative and referendum; 405,124 in all. Fully one-half of the signers are downstate voters, the other, citizens of Chicago and Cook county. The signatures sent from Springfield, the state capital, numbered 13,864.

The immediate result of this agitation will be to register the people's will concerning these three measures on "the little ballots" at the November election. Then it will remain to be seen whether their "representatives" in the Legislature will really represent them by referring these constitutional amendments to the voters for their ratification at the following election. If the legislators to be elected in November still refuse to respond to the bidding of their constituents, the citizens' only recourse will be to nominate and elect two years hence those who will do so.

But the chances are favorable for earlier success. The Civil Service Reform Association claims that its battle is practically won, as over half of the candidates have pledged themselves to work and vote for the enactment of a comprehensive and adequate civil service law, not only for the state, but also for Cook county, where alone two thousand appointments in the public service are still under the spoils system. The county central committees of both parties have declared for the enactment.

A large number of the candidates have also promised to vote for the other measures. It is hardly credible that a majority of the Legislature will risk their political lives in refusing the people a chance to vote on these proposed constitutional amendments. The popular vote favored the initiative and referendum, five to one, eight years ago, and citizens all over the state are now aroused and uniting to support all three amendments.

Meanwhile the circulation of the petition has been a powerful factor not only in awaking the people to oppose the corrupt men and methods betraying them and disgracing the state, but also in educating and training citizens to make the best use of the initiative and referendum, when they must meet the increased responsibilities and exactions of direct legislation.

Since the above note was set up in type, both the democratic and republican state conventions have endorsed in their platforms the initiative and referendum, the extension of civil service and a corrupt practices act.

INDIANA CONFERENCE OF CHARITIES AND CORRECTION

The care and prevention of insanity received especial emphasis at the Indiana State Conference of Charities and Correction, held at Marion, September 10-13, with over 400 delegates in attendance and more than a thousand local people registered. The presidential address, by Dr. S. E. Smith, superintendent of the Eastern Hospital for the Insane, dealt with the problem of the mentally defective, which has been taxing the courage and mind of the social worker and legislator in Indiana for years. In spite of the recent opening of a new hospital at Madison, Dr. Smith pointed out that there are still hundreds of mentally defective for whom the state is not prepared to care. He proposed a remedy which might relieve the situation automatically. This is the colonization of the insane. Quiet chronic cases and subjects of periodical insanity, and even a fair proportion of convalescents, could be transferred to the colonies and employed in a way that would contribute to their support and well-being. The conclusion of the president's message was an impressive plea for the prevention of in-

sanity, by plain discussion of its causes in the home, school, church, and physician's office.

The program included such names as Mrs. Albion Fellows Bacon, who has been directly responsible for a housing reform law in Indiana; Ernest Bicknell, national director of the American Red Cross; Mrs. Kate Waller Barrett, president of the National Florence Crittenton Mission of Alexandria, Va., and Caroline Bartlett Crane of Kalamazoo, Mich. Mrs. Barrett's address was a fine presentation of the regenerative power of motherhood.

The conference executive committee followed the customary plan of propaganda for social work, by placing workers in the pulpits of the city and by a mass meeting addressed on the subject by the governor, Thomas R. Marshall. Over 2,500 people listened to his address outlining the history of public charity and correction in Indiana, and presenting its moral basis. General sessions embracing topics under the heads, juvenile, county and township, state and city charities, were held, but were supplemented by the more intimate round table discussions upon allied topics. By far the most important discussions were at the round table over which Prof. U. G. Weatherly presided. They were devoted to the interests of the Indiana Child Labor Committee. Though the central topic of this discussion was to be Industrial Training, the meeting was stirred by a report read by E. N. Clopper of Cincinnati, a member of the National Child Labor Committee, giving the results of an investigation in Indiana cities of the night messenger service. Reading from a report containing the quoted remarks and detailed experiences of messengers in Indianapolis, Terre Haute, Evansville, Fort Wayne and other cities, he showed the moral degradation to which immature boys were exposed in the night messenger service. The knowledge of this shocking condition will have the effect of strengthening the hands of the Indiana State Committee and the National Child Labor Committee. The former at this meeting elected Professor Weatherly president.

The local committee gave the 400 social workers the opportunity of inspecting local institutions, among which are the National Soldiers' Home, the county jail, hospital, poor asylum and orphans' home.

The conference chose Indianapolis as the next meeting place and adjourned after selecting these officers:

President, Prof. U. G. Weatherly, Bloomington; vice-presidents, Judge J. Collins of Indianapolis, Charles W. Morses of Indianapolis, Prof. C. C. North of Greencastle, Judge Marshall Williams of Marion, Mrs. T. D. Barre of Muncie, Judge Marshall Hacker of Columbus, Mrs. E. Crisler of Greencastle, Dr. N. C. Van Nuys of Newcastle, Superintendent A. E. Carrol of Fort Wayne, Judge James Clark of Danville, Dr. Words of Indianapolis, Judge James Combs of Frankfort; secretary, Mrs. W. Campbell of Anderson; assistant secretaries, H. M. Elliot of Marion, F. D. Loomis of Indianapolis; chairman of executive committee, Dr. S. E. Smith of Richmond.

SHIRTWAIST SHOPS AFTER THE STRIKE

An investigation of the shirtwaist trade in New York, made not long after the settlement of the strike[1] last spring, by Pearl Goodman and Elsa Ueland, students in the New York School of Philanthropy, shows that 356 out of the 450 shops in New York city "signed up" with the union, in many cases the agreement containing compromises on some points. Nineteen shops, for instance, remained on the open shop basis, a very few retained the sub-contracting system and a large number agreed to pay for overtime at regular rates only, instead of time and a half or double time. Under the agreement, it will be remembered, wages were arranged by a committee in each shop. As a result of this prices in different shops were found to be, at the time of the investigation, so widely divergent that generalization was impossible as to whether there had been any, or any considerable, improvement in the average wage throughout the trade. In regard to hours, the union is shown to have been strikingly successful, all the settled shops adhering to a fifty-two hour week and a surprisingly large number of non-union shops adopting the same standard Equally successful were the workers in

[1] See THE SURVEY for February 19, 1910.

securing the observance of the two hours' overtime limit, though the number of days for overtime work sometimes exceeded the three a week in the original demand. This limitation of overtime, however, does not seem to have affected the length of the dull season, for as early as May many shops were found doing little or no work. One worker among many instances, whose average during the busy season was eighteen dollars a week, stated that his last week's wages had been $1.29. How the union regulation requiring that the work be divided among all employes during the slack season affected the pay envelope, the investigators do not say. The amount of slack and idle time was found to vary according as the shops worked on the stock, order, or contract plan. Contract work for other shops is done in the lowest grade of shops, is the worst paid and has the most irregular season. The majority of the shops work on orders from samples, and this method causes rush seasons, often coming very unexpectedly, varied by slack and idle periods, covering about four months in the year. It is the unexpectedness with which orders come in that forces the employes to report daily during the slack season and "wait around" a good part of the day. The stock; or stock and order combined, method means a longer season, but the rapid changes of fashion prevent employers from keeping enough stock on hand to make this method of work general. The next steps to be taken by the union for improving conditions in the shops are, in the opinion of the investigators, to devise some method of extending the season, to adopt a fixed wage scale, such as has been gained by the cloakmakers, as a means of doing away with the very low rates of pay in the contract shops, and of having a working basis for future wage adjustments, and to inaugurate some regular system of apprenticeship that will abolish the excessive specialization in many shops. All of these steps would tend to a uniform standard throughout the trade, the absence of which is the chief obstacle in improving the condition of the workers.

INQUIRY INTO UNEMPLOYMENT

Statistics of unemployment thus far secured in the United States are very unsatisfactory, for the work of securing accurate data on this important industrial problem has scarcely begun in this country. Special interest, therefore, will attach to the second report of the New York State Commission on Employers' Liability and Causes of Industrial Accidents, Unemployment and Lack of Farm Labor. Having made its report to the Legislature upon Employers' Liability and secured the enactment of its recommendations into law, the commission has now turned its attention to the other subjects assigned to it.

George A. Voss, chairman of the subcommittee on unemployment, and William M. Leiserson, who has been engaged by the commission to take charge of its investigation of unemployment, have spent the summer in Europe making an inquiry into the recent efforts to solve this difficult problem in foreign countries.

Meanwhile, printed inquiries have been sent out from the office of the commission in New York to all trade unions and employers reporting to the State Department of Labor. The secretaries of the trade unions are asked such questions as these:

> Is unemployment a grave problem in your trade?
>
> How much time during the year does the average workman at your trade lose?
>
> Is your trade seasonal? If so, how many months is it busy? How many months is it slack? How many months is there no work?
>
> What is the least number of members that you have had unemployed at any time during the last year? What is the greatest number? etc.

The employers were asked to give the number of their employes for each month of the year 1909, and also, if possible, the greatest and least number employed during each of the last ten years. They were asked also:

> During 1909 how many months was your plant running full time? How many months part time?
>
> How many days was your plant idle during 1909, and what were the reasons for closing down?

Are you always able to get all the help you want?
What kind of labor do you find scarce?
What kind of labor is over-supplied? etc.

Finally both employers and trade union secretaries were asked to give their opinions in regard to the establishment of state labor exchanges, and also to furnish the commission with any observations they cared to make in regard to the causes, extent and effects of unemployment and the remedies therefor. The response to these inquiries has been very gratifying. Replies have been received from 728 employers and 388 trade unions, and they are still coming in, so that there is a prospect of securing statistics of exceptional value.

INFANT BLINDNESS IN MASSACHUSETTS

Dr. Simon Flexner's condemnation of certain medical schools and colleges which are turning out inefficient practitioners is effectively supported by recent investigations of the research department of the Boston School for Social Workers. Through a study of ophthalmia neonatorum in five cities of the commonwealth the investigators discovered that the usual prophylactic employed by the graduates of a certain well known French-Canadian school is lemon juice. Mr. Pickwick's friend, Dr. Sawyer, could get some pointers from these M. D.'s.

Taking into consideration the general lack of knowledge and the carelessness of doctors in charge of newly born children, it is not surprising that the Massachusetts investigators found, as a result of interviewing ninety-five physicians in five cities, that only seventeen per cent of the babies were protected from possible blindness by the routine use of a prophylactic. The records of 5,949 births were examined—forty-eight per cent of the total births of the five cities—and forty-two per cent of the physicians never used preventive measures. Forty-one per cent did or did not take proper precaution according to their own judgment.

The new law which has gone into effect in Massachusetts, allowing $2,500 for the free distribution of a prophylactic, ought to clear up matters considerably, for with every vial of silver nitrate, which will be sent to all physicians in the state, is a folder describing the absolute necessity for precautionary measures if infantile blindness is to be prevented.

The investigation also showed laxity of practitioners in complying with the law requiring that cases be reported. In the cities investigated it was found that 18,421 births had been recorded in 1909. Thirty-three cases of ophthalmia neonatorum had been reported to local boards of health, while 108 cases were discovered by the investigators.

In spite of the fact that the midwife has no legal status in Massachusetts, she plies her trade extensively, especially in the foreign quarters of smaller cities. In four of the cities investigated, where 14,795 births had been recorded in 1909, 2,083, or seven per cent, had been recorded by midwives who, however, seem no more to blame than physicians for blindness among babies.

The Massachusetts Commission for the Blind has issued a social service study of 116 cases of ophthalmia neonatorum cared for in the Massachusetts Charitable Eye and Ear Infirmary. Summarizing the situation this pamphlet says:

The general practitioner has yet much to learn of the disease, and the parents know nothing of it. Upon these two groups—the practitioners and the parents—the baby must depend for the gift of sight, and the campaign of education must be carried on to include the two.

So far as this study shows, only four babies of the six made blind within the year are alive today (three in this state); but the fact that six babies were made blind should not be lost sight of. Dead blind babies tell no tales and so make no impression on the public; but in closing the case against infant ophthalmia, these dead babies, as well as their perhaps less fortunate fellow-victims who live to grope their way through life, should appear as evidence. Those made blind, and for whom the state has to provide special and expensive education, do not begin to tell the whole story of ophthalmia neonatorum; nor do the totally blind babies complete the records of this disease; there are also those who have been made blind in one eye, thus handicapped in sight and appearance, whose chance of going through life successfully is hardly more than half that of the person with normal

vision. Still others are disfigured by scars on the eyes, and disabled by defective vision. When one considers that the question of ophthalmia neonatorum no longer admits of debate,—that the cases that do not respond to proper treatment are so rare as to be left out of the reckoning,—the number of blind and disabled from this cause in a single year is appalling. And the pity of it is that the burden is put upon a helpless baby,—and this thing need not be!

MEMPHIS STRUGGLES FOR PLAYGROUNDS

If persistency counts in bringing home a sense of social responsibility to a community, the efforts of the Memphis, Tenn., Playground Association will be crowned with success. Here, as in many other southern cities, the development of a community interest is slow and uphill work. But recent indications point to a new era.

The association, of which Mrs. Thomas M. Scruggs is president, voted last May to secure the fullest possible public expression as to the need for public playgrounds and baths, and suggestions as to ways and means, by a list of suggestive questions to be submitted to all the organized bodies of the city. These questions called attention to Memphis's prosperity and its comparative lack of provision for its unfortunates, emphasizing particularly its apparent neglect of its children. The lack of recognition here that "the most valuable asset of a city is its children," is evidenced by the failure to provide adequate public schools and playgrounds for them.

Though the Playground Association last March purchased a site for a playground, club and free bath and offered, in co-operation with the city, to pay all but $6,000 of the expense of building, the Board of Education has failed to make an appropriation to meet the deficit. Nevertheless, the association has not lost courage, but has enlisted the working people in its campaign. In the Labor Day parade every man wore a small paper shield bearing the inscription, "For Memphis Children, Public Playground and Public Baths." This was the suggestion of Rosa Lee, one of the directors of the association, to whom also was due the playground float, conspicuous in the line of march.

JUDICIAL DISREGARD OF LAW

THE SURVEY of September 10 referred to the reorganization of the Children's Courts and Magistrates' Courts in New York city under the provisions of the law drafted by the Page Commission. THE SURVEY expressed regret that the newly appointed chief justice of the Court of Special Sessions should have continued in the Manhattan Children's Court the system of monthly rotation of judges. Similar opinions have been expressed by the New York *Tribune* and the New York *Times*. Chief Justice Russell, in a communication to the *Tribune* of September 11, defends the monthly assignments. THE SURVEY has made further inquiries, and finds that the facts are even more unfortunate than was suggested in its issue of September 10. While not questioning the excellent intentions of Chief Justice Russell, we cannot escape the conclusion that he has been led into a very serious error, and that he should retrace his footsteps. The Children's Courts in New York city are legitimately a matter of interest to juvenile court workers throughout the country, and the matter seems to us sufficiently important to discuss somewhat fully.

In order to understand clearly the present situation, it should be recalled that for some years the custom in the Manhattan Juvenile Court had been that of a monthly rotation. The six justices of the Court of Special Sessions, First Division, were assigned to monthly periods of service. In the Brooklyn Juvenile Court, the six justices of the Court of Special Sessions, Second Division, had been assigned to bi-monthly periods of service. Not all of the justices cared especially for the service in the Children's Court, and consequently some of the justices served for a longer period than two months, so that the court occasionally had the benefit of the service of a judge continuously for a period of four months or longer.

The system of monthly rotation in Manhattan and bi-monthly rotation in Brooklyn was carefully considered by the so-called Page Commission, and unqualifiedly condemned. The Page Commission was comprised in part of members of the Senate, in part of members of the Assembly, and in part of citizens selected by Governor Hughes. The chairman of the commission, Alfred R. Page, after serving very effectively as a state senator, was elected last autumn a justice of the Supreme Court. The commission represented in its membership both of the leading political parties and many varying shades of opinion. Its counsel had been a justice of the Court of Special Sessions and later attorney-general of the state. The deliberate conclusions of this commission should naturally, therefore, have great weight in interpreting the statutes framed by it. On the question of rotation, this commission said:

> It has been urged that the judge of the Children's Court should devote all his time to that work and that a limited number of judges, selected for a completely separate court, would more efficiently carry on this important work
>
> The commission is in entire sympathy with the proposition that the Children's Court requires something more than brief or temporary sittings of a judge.
>
> The judge sitting at the Children's Court should, so far as practicable, follow the case of a child from the beginning until its final disposition. Under the present system the justices in the First Division sit for a term of one month only twice each year, and in the Second Division for a term of two months only once in each year, unless by voluntary arrangement they exchange their assignments.
>
> This is a radical defect which needs remedying; for the commission is of the opinion that it is vital to the successful administration of this work that the justice before whom the child is originally brought shall follow the course of that child through all the stages, which end either in permitting the child finally to go at large or in committing the child to a reformatory institution. The justice before whom the child originally comes is familiar with the details of the case, has presumably caused to be investigated every fact or circumstance throwing light upon the child's conduct, history and surroundings, has formed his own estimate of the child and his theory of what can be done with it, and he should follow that case in every judicial detail to completion.
>
> Our observation has shown us that there are certain of the justices of the two divisions of this court who are peculiarly adapted for the work of children's courts, who have the patience and enthusiasm which are so necessary to successful accomplishment, and who would be glad to devote themselves for long periods of time to this particular branch of work. On the other hand, other justices, fully as capable in other directions, are not by temperament fitted to deal so well with the children.
>
> More than this, a justice passing on the cases of children should fully acquaint himself with the character and conditions of the institutions to which he must commit these children. He must be so fully informed that he knows exactly what he is doing in each case.
>
> There should be a direct provision that in the assignment of a justice to sit at the Children's Court consideration be had as to the fitness of the justice and the permanency of the assignment, and the intention of the Legislature should be made clear that so far as practicable the justice assigned to the Children's Court should devote his sole attention to that work.

The precise language of the statute enacted on the recommendations of this commission was as follows:

> In assigning justices to sit in the Children's Court, he (the chief justice) shall have regard for the fitness of the justice so assigned, and, so far as practicable, shall make such assignments for substantial periods of service in said Children's Courts. (Laws of 1910, Chapter 659, Section 14.)

The conclusion cannot possibly be avoided that the term, "substantial periods of service," as used in the statute, meant something other than, and essentially different from, the monthly and bi-monthly rotation which had been described and condemned by the commission and which this statute was intended to abolish. Under almost precisely the same statutory phraseology, enacted also on the recommendation of the Page Commission, the chief justice of the City Court in Buffalo had assigned one judge to sit continuously, except during vacations and unavoidable absences, in the Children's Court of that city.

In the light of these facts, it seems to us impossible to escape the conclusion that the assignments by Chief Justice Russell were in direct violation of the spirit, if not of the letter, of the law.

We referred in our previous issue to the Manhattan assignments. We have

since secured the assignments also for the Children's Court of Kings County (Brooklyn), and find that in place of the bi-monthly rotation, there has been substituted, with unimportant exceptions, a system of monthly rotation. The system of monthiy rotation has also been extended, practically without exception, to the newly established Children's Courts in Queens and Richmond counties. The table of assignments to the various Children's Courts in New York city suggests a checker-board. It is as follows:

ASSIGNMENTS OF JUSTICES TO THE CHILDREN'S COURTS.

	New York County.	*Kings County.*	*Queens and Richmond Counties.*
September 1910	Deuel	Fleming	Ryan
October 1910	Zeller	Salmon	Ryan
November 1910	Wyatt	Deuel	Russell
December 1910	Salmon	McInerney	Forker
January 1911	Wyatt	Wilkin	Ryan
February 1911	Salmon	Wilkin	Moss
March 1911	Olmsted	Moss	Fleming
April 1911	Wilkin	Fleming	Olmsted
May 1911	Hoyt	Ryan	Salmon
June 1911	Hoyt	McInerney	Wilkin
July 1911	Deuel	Wilkin	Russell
August 1911	Hoyt	Wilkin	Deuel
September 1911	Hoyt	Ryan	Wyatt
October 1911	Wyatt	Moss	Hoyt
November 1911	Wyatt	Deuel	Russell
December 1911	Salmon	McInerney	Forker

It will be observed that in the Manhattan court for a period of sixteen months there are but three instances in which a judge sits for a longer period than one month continuously; in Kings county during sixteen months there are but two instances, and in Queens and Richmod counties, but one. Our columns are open for any explanation as to how these assignments can be considered to be "for substantial periods of service."

It should be borne in mind that the periods of probation, or more strictly speaking of parole as it is termed in the Children's Court of Manhattan, are as a rule a month or longer. They should of course be much longer. But even on the basis of one month of parole or probation, it is evident that very few children will finish their term of probation within the period of service of the judge who placed them on probation or parole. It is idle, in our judgment, to think of establishing an effective system of juvenile probation under these circumstances. Not only is the Manhattan situation unimproved by the new assignments; but a most serious blow has been dealt to the effectiveness of probation work in the Juvenile Court in Brooklyn.

Furthermore, the statute, as quoted above, states that in these assignments the chief justice "shall have regard for the fitness of the justices so assigned." This also should be interpreted in the light of the opinion of the Page Commission as quoted above. Apparently, then, Chief Justice Russell, within a very few weeks after his appointment, is so fortunate as to find that of a total of fifteen justices in the Court of Special Sessions, as now constituted, no fewer than thirteen possess special fitness for presiding in children's courts. Our columns are open to Chief Justice Russell also to explain his interpretation of the word "fitness."

One explanation of why Chief Justice Russell has made these assignments is to be found in his letter to the *Tribune* of September 11, in the course of which he says:

> Service in the Children's Court is very attractive to all the justices, every one of whom justly aspires to taking a share in this work. The points of attraction are doubtless the fact that the entire jurisdiction is in the hands of the single justice who holds the court, undivided with others; and the further fact that the scope and variety of matters justiciable in such tribunals are not limited to misdemeanors, but include offenses which, if committed by adults, would be felonies. Add to this that unparalleled opportunities are afforded at such a post of duty to influence the conduct and character of the juvenile delinquent, and it is seen that any justice may well believe that here lies the noblest chance in his life to do the best of the world's work.

In other words, the deciding factor in making these assignments has not been the welfare of the children brought before the courts, not the findings of the Page Commission, not the statute, but the desire of the different judges to sit in the Juvenile Courts. This raises an interesting question. Is the purpose of the Children's Court to afford pleasurable occupation for the judges of the Court of Special Sessions? Are the efficient management of the Juvenile Court and the welfare of the children of New York city to be subordinated to the desire of

the various judges to sit, from time to time, for a brief period in the Juvenile Court? The Page Commission was not unaware of these considerations. They were urged upon it most strongly. Nevertheless, the commission could reach no other conclusion than that the system was bad and therefore should be broken up, It therefore recommended legislation which, in its judgment, would accomplish this result

We submit that to any ordinary reader the language of the statute, read in connection with the facts above stated, permits of no other interpretation than that which we give. We therefore renew our statement of belief that these assignments violate, if not the letter, the spirit of the law and afford an unfortunate example of judicial disregard for law in which the convenience and inclinations of the various justices outweigh the plain language of the statute and the welfare of the children.

SOCIAL WORK FOR MEN IN THE CHURCHES

ORRIN G. COCKS

The graduate department of the Intercollegiate Branch of the Y. M. C. A. is interested in putting to work the graduates of colleges as they come to New York. It has found that no more than eight or ten per cent are joining the churches and attributes this to the lack of opportunities for social work. It has recognized the need of a base for inspiration for those attempting social service and has acquainted itself with the movements in the various denominations. It has seen the necessity of stirring up some churches to their social opportunities and has presented to them a program for larger work of this nature.

The logical group to do this work is the men's organization. The leagues and clubs are rapidly advancing beyond the lecture and discussion stage. The Congregationalists, Episcopalians, Methodists, Baptists and Presbyterians have local federations and in each case have introduced social service in the community as an object.

It is interesting to note also that interdenominational groups have been formed in various parts of Manhattan and the Bronx which have begun to take up social questions. In some cases they are composed of representatives of churches alone and in others a combination of the social and religious forces of the community. The Local Needs Association of the lower East Side, composed of representatives of all the forces present there, has been interested in the tuberculosis clinic for Italians, the construction of playgrounds under the new Manhattan bridge, the opening of the yard of public school 21 for mothers and children and the transferring of city property for playground spaces. The Lower West Side Church and Civic League, uniting the social and religious interests of the district on the West Side between Houston and Forty-second streets, has apportioned the neighborhood by blocks to various organizations, has collected lewd postal cards, circulated a petition regarding the tracks on Tenth avenue, increased the street signs on corners, and taken action on garbage removal. An organization was lately started at Hartley House to include the district between Forty-second and Fifty-ninth streets. This also has drawn together the religious and social interests of that district. The Laymen's Christian Federation, composed of representatives of fifteen churches between Fifty-ninth and Ninety-sixth streets, has developed a fraternal spirit, has closed one house of ill-repute and is discussing social work in the congested district on San Juan Hill. A federation of men's organizations has lately been effected in Harlem with a broad program for the fall. The church and civic interests in the Bronx are united and working toward the establishment of a hospital in that needy section. This interdenominational movement should be carefully noted.

The Laymen's Christian Federation has recognized the need of leadership by a man who can give his best time and thought to the work and is considering

the employment of a social secretary. This would seem to be the most logical step for the churches to take individually or in combination.

Suggestive plans of definite work formulated by those who are in touch with the needs of localities and of various groups should be put in the hands of the leaders of men's clubs, so that they will work for well-recognized needs under observation of disinterested experts. The graduate department has gathered together a preliminary list including relief of the poor, delinquency, education, parks and playgrounds, amusements, milk supply for babies, tuberculosis, inebriates, false weights and measures, housing and vagrancy.

It should be well recognized that there should be the most intimate and general co-operation with those organizations now working to improve moral, social and civic conditions.

The graduate department of the Students' Club has agreed for the present to act as such a clearing house between the work to be done and the men who can do it. The following plan was presented to representatives of all the men's organizations of Manhattan and the Bronx on May 17:

> The men of the church organizations recognize the need of definite social work taking the energies of the church men for the sake of the city, the churches, and the men now doing little practical work. The need is evident. The men are ready. There remains the formation of a wise program and method of procedure.
>
> It is assumed that the men's organizations, under proper direction and with a wise plan, are the logical bodies to take up in the churches such social work.
>
> It is proposed that individual churches, a combination of churches of different denominations in a neighborhood, or the denominational group be urged to employ at least one secretary who shall be highly trained along social lines, who shall have executive ability to put untrained men at work, and who shall have an undoubted religious motive in doing this.
>
> It is understood in every case that cooperation with existing social and moral agencies doing satisfactory work be encouraged.
>
> The graduate department of the Students' Club agrees, until the work can be placed in the hands of a group of trained directors, to put into shape a definite list of opportunities for social and moral work throughout the city, which can be taken up by individuals, committees, or organizations. It will submit such suggestions, with the approval of the ministers of the churches, to the men's organizations. It will also assist in finding the most important and interesting work to concentrate upon and in beginning such work.

If, as Edward T. Devine contends, religious work consists largely in the motive behind the work, it is plain to be seen that there is opportunity for indefinite expansion beyond the meager group of things offered to men in the ordinary church. The younger men of the churches today realize the need of more work in and through their churches. It would be well for the social organizations to recognize the vast latent forces existent in the men's groups of the churches and aid these men to work out the difficult problem of making their power felt where it is most needed.

SOCIAL ASPECTS OF ALCOHOLISM

HOMER FOLKS

No one fact, other than the hard fact of poverty itself, confronts social workers, in whatever particular field they may be engaged, so constantly as alcoholism. The drunkard's family has ever been the insoluble problem in home relief, public and private. The drunkard's children have ever been the despair of child-caring agencies. Authorities on insanity accept alcoholism as one of the dependable sources of supply for their constituency. General hospitals either bar the doors against the alcoholic and inebriate, or, if public institutions and therefore obliged to receive all classes of patients, find the alcoholic ward a source of ever-recurring trouble. The conscientious almshouse superintendent finds his best plans miscarried, and the discipline and régime of his institution broken up, by the in-and-out alcoholic rounder. Those who are undertaking the newer lines of preventive work find themselves at once

face to face with alcoholism. The tuberculosis campaign is in many respects also a campaign against intemperance. The promising movement for the prevention of insanity finds alcoholism one of the two very definite factors clearly indicated as positive causes of certain important forms of mental breakdown. In every department of the correctional field, alcoholism is ever present. The lower courts are clogged with habitual drunkards; the upper courts are distracted by questions as to the responsibility of the criminal who is part way along on the road to an alcoholic insanity. Probation commissions are issuing leaflets on how probation may sometimes help the drunkard. Several states have established or are establishing hospital colonies for inebriates. In short, without attempting to define precisely the rôle of alcoholism as cause or as effect, it is perfectly clear to every social worker that alcoholism is present as a serious factor in a great part of his work.

Such being the case, we should naturally expect to find social workers, above all others, careful students of the subject of alcoholism. We should naturally expect them to have clearly defined views on excise legislation. We should naturally expect to find them taking an active part in promoting such changes in laws and in administration, as experience shows tend to check alcoholism as a factor in social disorder. With a few striking exceptions, however, social workers and organs of social work appear to be peculiarly without comprehensive information as to the facts, or strong convictions as to how this important factor in their field is to be dealt with. How many of them, for instance, are familiar with the four volumes comprising the reports of the Committee of Fifty, on the Physiological, Legislative and Economic Aspects of the Liquor Problem and on Substitutes for the Saloon, or even with the one volume summary of the series, published in 1905.

This attitude on the part of the social workers is probably due, in part, to their inability to enter heartily into the ordinary "temperance campaigns," of the soundness of which the social worker has grave doubts; partly to the absence, until recently, of sufficiently clear and definite scientific confirmation of the alleged evil effects of alcohol; and partly to an instinctive feeling that nothing can be done about it; that over-indulgence in alcohol is so firmly intrenched in the habits and customs of the people, and that the business interests concerned in the sale of liquor are so powerful politically and otherwise, that the outlook for accomplishing any definite results, even if we were quite clear as to the results which should be aimed at, is far from encouraging. The feeling that nothing can be done about it is largely due to a provincial attitude. Few of us have attained to a national point of view on legislative questions. We think of the conditions and legislation of our own particular city or state as typical of the conditions existing generally throughout the country. We do not realize on what radically different lines the excise problem is handled in the various sovereignties comprising the United States. The mere fact of this diversity is, in itself, evidence of the unstable equilibrium of its status in any particular state. This attitude is not creditable to the social worker, nor will it be possible for him much longer to hold it.

If we mean what we say when we talk about controlling the preventable causes of poverty; if we are really in earnest in our campaigns for the prevention of tuberculosis and insanity; if we have not lost all vital faith in remedial measures; if we are, socially, progressives, not to say, insurgents; we must look squarely in the face the relation of alcoholism to our various problems, study the results of various systems of law and administration on the social effects of intemperance, and be prepared to throw our influence and our active support in favor of those things which are found to be working out helpfully. For instance, Governors Hoch and Stubbs of Kansas have repeatedly stated in public addresses that the prohibitory law in Kansas has greatly diminished the popula-

tion of the jails and poorhouses, and has emptied several of them. The alleged facts are exceedingly important, if true. We cannot remain indifferent in the presence of assertions having such a vital bearing on the matters with which we are daily concerned. The comparative lack of interest for a long time on the part of social workers in the new forms of old evils brought about by the Raines law hotels, is a similar instance.

The studies made by the Committee of Fifty, from 1893 to 1903, undoubtedly presented the best available statement of experience up to that time. Important experience, however, has been had since the investigations of that committee were closed, and it is extremely desirable, from the point of view of the social worker, that the studies undertaken by the Committee of Fifty should be brought up to date. This is one of the things to be done; there are others.

We need not await further information from the scientist before adopting a more rational method of dealing with persons arrested for public intoxication, and particularly those arrested repeatedly. It is perhaps hardly in order to speak of a more rational system, for it is difficult to detect in our present dealings with this class of persons, any evidence of rationality. The Massachusetts statute, permitting the release without court appearance of persons arrested for the first time, appears to have fully justified itself. The permissive law enacted for the city of New York in 1910, enabling that city to adopt, in its discretion, a comprehensive plan of dealing with persons arrested for public intoxication, and with inebriety in its various stages, is the most comprehensive act which has yet found its way to the statute books. It is to be hoped that the largest city in the country will lead the way by giving these new provisions an early and full trial. It is clear that neither the workhouse, nor the hospital for the insane, nor the general hospital, is a suitable place for the treatment of the inebriate. The institution which is to deal with him should have features of all these three classes of institutions. It must have the disciplinary authority of the workhouse; the mental, moral and occupational treatment provided by the modern hospital for the insane, and the skilled medical attendance of the general hospital. It will be less expensive—not more so—to deal with inebriates in this sort of an institution, than to care for them as we are now doing.

The campaign of education which must undoubtedly be undertaken in the near future to bring home to the multitude the facts as to the relation of alcoholism to disease, and as to certain economic and social aspects of intemperance, must be undertaken, in all probability, by the social worker, as the campaigns for the prevention of tuberculosis and insanity have been. The materials for such an exhibit, as Miss Higgins of the Associated Charities of Boston has pointed out, are rapidly becoming available, and only await the skilled interpretation which has been applied so effectively in the tuberculosis campaign. We confidently await the appearance in the near future of the "Exhibition of the Effects of Intemperance," and predict for it a place among the exhibitions on tuberculosis, on congestion, on tenement houses, and on other social evils, second only to the tuberculosis exhibition.

We may properly look to the various schools of philanthropy to send out trained workers, not only well informed as to the social effects of alcoholism, but full of confidence that whatever needs to be done about it can be done; that, as a cause of poverty, it is to be classified with the causes that are subject to social control.

The successful campaign initiated by Robert A. Woods for the "bar and bottle" bill in Massachusetts last winter; the appointment by the National Conference of Charities this year, for the first time, of a committee on drunkenness, and the appearance of this special number of THE SURVEY devoted to alcoholism, are, we trust, but the first evidences and fruits of a new interest and a new purpose on the part of the social worker in relation to alcoholism as an obstacle to social betterment.

ALCOHOLISM AND SOCIAL PROBLEMS

LILIAN BRANDT

There is probably not a reader of THE SURVEY who is not convinced (or who does not take for granted) that the use of alcohol—internally—is a serious social problem. For many decades the drunkard's family was accepted as the type of Anglo-Saxon poverty. Later, less obvious relations between intemperance and poverty and crime were observed; and in comparatively recent years physiologists and psychologists have been establishing facts about the action of alcohol on the human body which not only confirm the conclusion of non-scientific observers, but go very much further.

As long ago as 1853 the situation was summed up very much as it might be today:

> All are agreed as to the baneful influence upon health and morals resulting from the excessive use of alcoholic drinks, and of the importance of guarding against this abuse of them by every means within our power. But so long as the opinion prevails, that in moderate quantities the use of these drinks is both proper and salutary, it will scarcely be possible to guard the masses against indulgence in them to excess—every effort to stay the progress of intemperance, with its attendant evils, disease, poverty, insanity and crime, will be unavailing.

This statement is found in the preface to a hundred-guinea prize essay on the Physiology of Temperance and Total Abstinence by Prof. William B. Carpenter, an eminent physiologist connected with the University of London. Professor Carpenter thought there was an important province for "the medicinal use of alcohol in appropriate cases," but his other conclusions were:

> That the capacity of the healthy Human system to sustain as much bodily or mental labour as it can be legitimately called upon to perform, and its power of resisting the extremes of Heat and Cold, as well as other depressing agencies, are not augmented by the use of Alcoholic liquors; but that, on the other hand, their use, under such circumstances, tends positively to the impairment of that capacity;
>
> That where there is a deficiency of power, on the part of the system, to carry on its normal actions with the energy and regularity which constitute health, such power can rarely be imparted by the habitual use of alcoholic liquor; its deficiency being generally consequent upon some habitual departure from the laws of health, for which the use of Alcoholic liquors cannot compensate;
>
> That it is the duty of the Medical Practitioner to discourage as much as possible the habitual use of Alcoholic liquors, in however "moderate" a quantity, by all persons in ordinary health; and to seek to remedy those slight departures from health, which result from the wear and tear of active life, by the means which shall most directly remove or antagonize their causes, instead of by such as simply palliate their effects.

The general effect of the scientific studies of recent years has been to reduce the emphasis on such terms as "intemperate use," "excessive indulgence," "abuse;" to show that habitual "use" is "abuse," that any regular indulgence is "excessive."

It is now asserted that alcohol is not to be regarded as a stimulant, that it depresses and weakens the action of the heart, interferes with digestion, affects the nervous system unfavorably, and lessens the normal resistance of the body. That occasional individuals addicted to its use are able, probably on account of extraordinary inheritance, to do an exceptional amount of hard work, or even to execute unusual artistic or creative tasks, does not militate against these firmly established conclusions, which rest partly upon experiments on various of the lower animals nearly related to man, and partly upon experiments and observations which have been made on man.

Kittens, under periodical doses of alcohol, large enough to produce intoxication, have been found to suffer a "psychic collapse"—lose their playfulness, intelligence, and even their fundamental instincts. Dogs develop marked timidity. Rabbits, dogs, and kittens all exhibit an unusual susceptibility to infection. Certain diseased conditions of liver, heart muscles, kidneys, and stomach develop. There is some evidence, although so far it is slight, that the progeny of alcoholic animals are less numerous than they should be and physically inferior. Abor-

tion is frequent. Young animals and pregnant animals seem to be more susceptible to the effects of alcohol.

It is not improbable that animals may be more susceptible than human beings to the injurious effects of alcohol; and for this reason experiments which have been conducted on intelligent, sometimes highly educated, men, to discover the effect of very small quantities of alcohol, are of even greater interest. The conclusions which have been accepted by scientists are that even a "moderate" amount of alcohol, if taken habitually, tends to have the following effects, to different degrees in different individuals:

1. To diminish the amount of mechanical muscular work performed, as measured by the ergograph;
2. To weaken the power of attention, as indicated by the length of time required to write down certain figures or letters;
3. To lessen efficiency in the performance of work like typesetting, in which it is comparatively simple to measure the amount accomplished in a given period;
4. To retard the mental processes involved in
   (a) Adding single numbers,
   (b) Writing down words suggested by a given word,
   (c) Memorizing figures.

The curious thing about this is that the individual affected imagines he is working faster, thinking more clearly than usual. "This is one of the disadvantages of wine," said Dr. Johnson, "it makes a man mistake words for thought." In modern scientific phraseology, it "interferes with the power of forming correct judgments" and "lengthens the time taken to perform complex mental processes." The sensations of comfort and relief from fatigue are similar deceptive illusions; the stimulation and exhilaration are due to the fact that the alcohol deadens the power of the higher nerve centers to register sensations. It has been found, moreover, that apparent stimulation produced by small doses of alcohol after a certain degree of fatigue was reached could be reproduced, in much greater intensity, by small doses of sugar.

A drug which has these effects on mind and body, and which is consumed in amounts which anyone who cares for such statistics can readily find specified, must of necessity be an important factor in many of our social problems. We hardly need further evidence in order to accept for the United States the conclusion reached by the English Inter-Departmental Committee on Physical Deterioration in 1904, that " the question of 'drink' occupies a prominent place among the causes of degeneration."

A tremendous lot of evidence, however, has been adduced to prove that this is so. The relation of alcohol to infant mortality, fecundity, accidents, crime, poverty, insanity, feeble-mindedness, epilepsy, tuberculosis, disease in general, expectation of life, divorce, suicide, prostitution, industrial efficiency, backwardness in school, and no doubt to many other social problems, has been set forth again and again, and in most cases seems self-evident. Some of the statistics which are used as evidence are above reproach, while others, unfortunately, have no significance. The most widely quoted statistics, for example, are percentages (worked out to two decimal points!) which tell exactly how much of the poverty and exactly how much of the crime in the United States is "due to" intemperance. Other percentages (generally content to dispense with decimal fractions) give "conservative estimates" of the proportion of disease, insanity, mental defect, epilepsy, and various other evils, which is "caused by" intemperance. There is as yet little scientific basis for any such percentages. We have not even the data for determining whether the proportion of intemperate persons among the insane, for instance, is greater or less than it is among the general population of the same age-distribution. It seems incredible that such naive methods as have been resorted to for securing these popular percentages should have received tacit approval, as they have, by almost universal acceptance of the results. It is an especially curious phenomenon that they are quoted gravely and authoritatively by medical scientists who would not think of countenancing similar methods in their own investigations. Is it due to courtesy? Do they accept the conclusions of students of social questions without scrutinizing

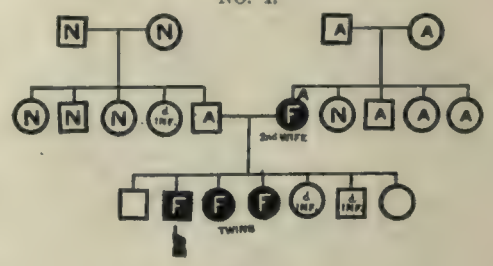
their methods, just as we accept the conclusions of the scientists? Or do they think that scientific methods have nothing to say to social problems?

Disregarding, then—obliterating, if it were possible—these percentages of different evils which have been attributed to alcohol, let us see what evidence there is that is worth keeping in mind. Fortunately, there are other methods than the statistical by which facts may be established, and there are other ways of recognizing a relation between two facts than by finding what proportion the one is of the other.

The use of alcohol tends to produce poverty. It is an expensive habit, and unless there is a fair surplus income, it generally means cutting down on food, clothing, shelter, or other of the necessities of life. Whatever nutritive values the alcoholic beverages may have, they are an expensive form of food, and they do not, at any rate, nourish the members of the family who do not partake of them. The income, moreover, is apt to become irregular and to decrease, for everybody knows that drinking habits are a handicap in getting and keeping work. Other things being equal, employers prefer men who do not drink, for there is a consensus of opinion, apart from scientific proof, that alcohol interferes with efficiency. It is probable that this handicap is much greater now than formerly, not only because of a changed attitude on the part of many employers, especially large corporations, but also because of the changed nature of the work which we have to do. Factory work, work on railways, office work, intellectual work, are all incompatible with drinking habits.

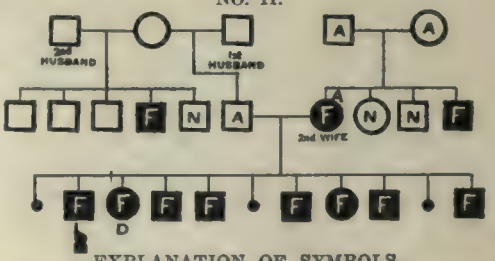
With these considerations in mind, and further deductions which naturally occur, it is sufficiently obvious that intemperance is a cause of poverty, even if we relinquish the well-worn percentages.

Conversely, of course, poverty is an important cause of intemperance. Overwork, undernourishment, insufficient oxygen, worry, lack of recreation, have probably quite as much to do with producing drinking habits as alcohol has to do with bringing about these characteristic conditions of poverty.



The relation of alcohol to crime is even more obvious. In so far as drunkenness is in itself an offense which renders one committing it liable to arrest, sentence, and imprisonment, the percentage such arrests, sentences, and commitments to prison are of the total number can be ascertained, and these percentages are almost everywhere startlingly high, generally over fifty. They are, however, rather a commentary on the irrational methods of dealing with this offense than an indication of the prevalence of intemperance. The drinking habits of inmates of penal institutions can also be ascertained with some degree of probability, and such inquiries have frequently been made, producing percentages as high as ninety-six and even one hundred, which are beyond a doubt higher than in the general population. Further than this, however, no trustworthy statistics have been put forward. The proportion of prisoners whose fathers were addicted to the use of liquor, or mothers, or grandparents; the proportion who ascribed their crime to their own use of alcohol, or to the use of alcohol by some one else; the proportion who "were in liquor at the time of forming the intent" to commit the crime, or for whom the use of alcohol was "a cause leading to the condition which induced the crime"—these laboriously compiled statistics mean very little. For a conception of the real relation of the use of alcohol to crime, we must fall back on what has been observed of the action of the drug on the will and the emotions, and on what is matter of common knowledge. Its relation to sexual immorality has not perhaps been sufficiently emphasized. Its deadening effect on the higher nerve centers is responsible for many a girl's first step toward prostitution; it is an even more important factor in creating the demand for the service of prostitutes; and the business relation between the liquor traffic and the traffic in the bodies of women is an important element in the situation.

Alcohol is undoubtedly a factor in producing disease and death. Certain diseases are caused directly by it and by nothing else. It predisposes to, and aggravates, many others, notably tuberculosis, cancer, and syphilis. It is one of



the causes of suicide, and of accidents, industrial and other kinds. Physicians generally recognize that the prognosis is graver in pneumonia, cholera, erysipelas, and other infections, if the patient is even a moderate drinker. On the other hand, immoderate drinking may be the first symptom of a disease, instead of its cause, and this frequently leads to erroneous conclusions. The general effect of alcohol on health has been summarized statistically from records of certain English insurance societies, which indicate that at the age of thirty the abstainer has the prospect of three and one-tenth more years of life than the non-abstainer in the same general economic class, and that he will have only about half as many weeks of illness from year to year; that of a hundred abstainers twenty years of age, eleven more will live to be seventy than of the same number of the general population. American figures, derived from the experience of the Mutual Insurance Company of New York some years ago, showed that the actual loss occasioned by the death of non-abstainers was ninety-six per cent of the maximum expected loss, while the corresponding percentage for abstainers was only seventy-eight.

The relation of alcohol to mental disease and defect is more disputed. Mental disorders may be due chiefly to an underlying psychopathic constitution which is responsible for the intemperance as well. There are certain forms of insanity, however, which are caused only by alcohol; and alienists generally agree that many other cases are precipitated by it and also that inebriety in parents or grandparents is one of the important causes of that instability of the nervous centers which is at the bottom of much of the insanity. As to feeble-mindedness and epilepsy there is considerable difference of opinion among the authorities. There are some who think that alcoholism in parents has been exaggerated as a cause. Others, however, feel that it can hardly be exaggerated, and many family histories have been collected which seem to support this view, though there are not yet available any thoroughly satisfactory studies on a large scale. The two family trees on this page, furnished by one of the best institutions in the country for the care of the feeble-minded, are illustrations of conditions which are found again and again. In the first family, an alcoholic man, the son of normal parents, took for his second wife a feeble-minded alcoholic woman, whose mother and father, brother and two sisters were alcoholic. They had seven children. About the oldest and youngest we have no information. Three of the others are feeble-minded, and two died in infancy.

NO. II.

EXPLANATION OF SYMBOLS.

Squares represent males; circles, females.
A: alcoholic.
D: deaf.
F: feeble-minded.
N: normal (a blank square or circle indicates that no information about characteristics is on hand).
d. inf.: died in infancy.
Small black circle: miscarriage.
The hand shows which child is in the institution furnishing the history.

In the second family there was a similar union of an alcoholic man with a feeble-minded alcoholic woman of alcoholic parentage, and it resulted even worse: three miscarriages and eight feeble-minded living children, one of whom was also deaf, and seven of whom are, so far as we know, at large in the population of the state.

This is part of what is justly regarded as the crux of the whole problem—the effect of the use of alcohol on the children of the user. No argument or evidence is needed to prove that the chil-

dren of an intemperate father or mother are exposed to the risk of neglect and privation and abuse of many sorts. Whether or not they start life physically and mentally handicapped has not yet been settled. Competent observers have testified that abortions and premature births are more common in alcoholic women than in others. In a group of women prisoners in Liverpool the death rate among infants of the inebriate mothers was found to be over twice as great as the death rate among infants of the sober mothers. Ten temperate families of Berne who were under observation for a dozen years had sixty-one children, fifty of whom were normal, while only five died in infancy. Ten intemperate families of the same social class during the same period had fifty-seven children, of whom only ten were normal, while twenty-five died in infancy, and twelve were feeble-minded or epileptic. This is startling confirmation of what has been generally believed, but the cases observed are too few to establish as facts the conclusions suggested. And now comes a study from the Eugenics Laboratory of the University of London which seems to show that there is very little difference in health, physical development, and intelligence, between the children of temperate parents and those of intemperate parents. While these conclusions are so surprising that the authors of the report are almost apologetic about it, there is an explanation, suggested, indeed, by the investigators, which will reconcile them with our general idea that an alcoholic parent is an undesirable kind for a child to have. If alcohol is, as it has been called, "a potent agent of elimination," then the survival of habitual users of it to the age when they have children in school presupposes unusual original vitality, which might counteract, to some extent, the deteriorating effect of the alcohol; and the higher infant mortality among the children of intemperate parents would mean that their children who survive to school age are a more selected class than the children of sober parents, who are not eliminated so early.

It has been argued that just because alcohol is a "potent agent of elimination" it is to the advantage of racial development not to interfere with its action; that it is an influence in eliminating the unfit; and that the historical fact that the nations which use alcohol are tending towards sobriety is evidence that its use is a desirable step in evolution. This is the same argument that every now and then turns up to sport with the idea that all care of defectives and weaklings is but putting spokes in the wheels of evolution. It disregards the fact that such care, if it is rational in character, assists evolution, does not hinder it. It also disregards the fact that the destructive influences which eliminate the unfit tend to undermine the strength of others and make them unfit. Society is not made up of two rigidly separable groups: "the fit," to be conserved; and "the unfit," to be eliminated. There are many ways of eliminating the unfit. Nature's way is infinitely slow and cruel and wasteful. The way of an enlightened society is quick and merciful and economical. It consists in transforming the unfit into the fit as far as that can be done, and in diminishing the number of the unfit who are born or developed after birth. Wise social measures do not interfere with evolution; they may determine the plane above which evolution shall be allowed to go on by its own slow and costly methods, just as they may determine in business relations the plane above which competition may go on unrestricted.

It is not, after all, merely, or even chiefly, because of its relation to dependence and crime, and other problems which constitute a burden on private philanthropy and the public treasury, that the use of alcohol is a social problem. These are but the extreme manifestations of its injurious influence. The dependent and the criminal are a very small part of the total population. It is the tendency towards these results in persons who do not reach such limits, and even in those who are in no special danger of reaching them, that is a matter of gravest social concern. Far more important than the number of paupers and criminals made by alcohol is the loss of efficiency and vitality produced by it in the large part of the population which never gets into these two groups. As a "potent and deadly agent of physical deterioration" alcohol is indeed a national problem.

COTTAGE FOR WOMEN AT DUXHURST, ENGLAND.

The illustrations on this and the following page were forwarded to THE SURVEY by Lady Henry Somerset of England, who established in 1894, "The Industrial Farm Colony for Women," at Duxhurst, Reigate, England. This institution is constructed on the cottage plan and every effort is made to maintain a home-like atmosphere. Its establishment was an experiment but its success has been very great. Lady Henry Somerset says in one of the reports:

> The years which the colony has existed have been sufficient to prove that inebriety in women is not a hopeless, incurable evil, but that it yields to wise treatment. It may be said a thousand times that a woman who gives way to drink is irreclaimably lost, but of all the wandering ones whose feet were guided to Duxhurst, considerably more than half have been restored to womanhood, usefulness and happiness. And this percentage is obtained even when we reckon the insane, the dying, those unfit for treatment, and those who do not stay the full twelve months; if we deal only with those who fulfill what we consider the conditions necessary to cure, the percentage is much higher.

THE HABITUAL DRUNKARD

BAILEY B. BURRITT

ASSISTANT SECRETARY STATE CHARITIES AID ASSOCIATION

In the current discussion of the various aspects of the alcoholic question much emphasis is rightly placed on "prevention." "Prevention" is the keynote to the present campaign of public education and the results of the present movement will be valuable. But aspects of the problem other than prevention, merit consideration. The most immediate of these, because the one which constantly thrusts itself upon the attention of all who come in contact with the problem, and one which will continue until the necessarily slow working process of education for prevention can approach its ideal, is what should be done with the habitual drunkard. In other words, increased attention to the treatment of the victims of alcohol must go hand in hand with the increased emphasis upon prevention.

One of the greatest results of the energetic campaign which has been waged for the abolition of tuberculosis in the last few years, is a very great increase in the number of institutions, hospitals, sanatoriums and dispensaries which have been established in which the victim of tuberculosis can be treated in the incipient and in the slightly advanced stages of the disease. There has been, as well, a very great increase in the institutions in which the chronic and incurable case can be comfortably and well cared for, in such a way as to remove all possibility of menace to the health and well-being of society. A similar increase in provision for the treatment of the victims of alcohol must be made before the prevention of alcoholism can secure results comparable with those already attained in the prevention of tuberculosis. We must not only urge prevention and educate the public to the fact that a decreased consumption of alcoholic liquors means an increased longevity, and take steps to provide playgrounds and gymnasiums and health-giving activities which will interest young men, and give them a social life in surroundings which will not lead them into habits of excessive drinking; we must also provide for the best and most scientific treatment of persons who are in the process of becoming habitual drinkers, and even more particularly must we provide for the confirmed and incurable drunkard who needs custody, care and treatment, not only for his own sake, but more especially for the sake of society whose well-being he constantly menaces.

WHAT IS NOW DONE

The city of New York is quite typical of other large cities in the United States in its treatment of drunkenness. In the Boroughs of Manhattan and the Bronx, which represent sixty per cent of the population of the whole city, 24,277 persons were arrested for intoxication in the year 1909. 12,483, or fifty-one per cent were discharged by the courts. In the remaining boroughs about 16,000 persons were arrested for the same offense.

Seventy-five per cent of all persons not discharged by the courts are fined amounts ranging from one cent to ten dollars. Approximately two-thirds of all fines are amounts between one dollar and three dollars. Fines are paid in court, by relatives and friends of persons arrested or by the persons themselves, in about one case out of every three cases fined. The remaining cases fined are committed to the city prisons and the workhouse in default of payment of fine, to serve time, one day for each dollar of the fine, but in a few cases the fine is paid in the district prisons by relatives or friends and the person is then released. If the fine is not paid and is greater than three dollars the person is transferred from a district prison to the workhouse; if less than three dollars he serves time in the district prison.

Approximately twenty per cent of all persons held by the courts are committed to the workhouse directly under the cu-

mulative sentence law, which provides for an automatically increasing sentence which is dependent upon the number of times the person has been committed during the two previous years. This is very unsatisfactory, however, as the means taken to identify the persons are very inadequate and many escape the operation of the law altogether.

Briefly, then, the intoxicated person or habitual drunkard who is arrested and who comes before a court is either discharged, fined a small amount, or imprisoned from one to ten days. Of these three things that happen to him probably the discharge is on the whole the most satisfactory. It is certain that no good purpose is served by fining the person a small amount to be paid at once with the alternative of going to the city prison or workhouse. In most cases the man comes to court after a spree in which he has spent his last cent. One of two things must then happen: either he must serve time for the fine, one day for each dollar, or it must be paid by his wife or some member of his family or some relative. These can usually ill afford to pay even so small a sum, but make the sacrifice in order to save themselves and him from further disgrace. About two-thirds of the persons fined serve time in the city prisons or in the workhouse for failure to pay the fine imposed. In New York city only one-third of these fines are over three dollars; twenty-two per cent are one dollar or less. The result is that about two-thirds of all cases are fined from one to three days or barely long enough to get over an acute attack of alcoholism. They are then released while the thirst for more alcohol is still strong, and immediately beg or borrow money to get under the influence of alcohol once more. If they fail to do this they perform some menial service for a saloonkeeper and thus secure the drink which they crave. Within a few days such a person is again arrested, taken to the police station to sleep off his first stupor, and from there goes before the court to be fined again, and again sobers up in the city prison or workhouse. From the point of view of the individual it is apparent that this method of treatment is neither deterrent nor reformative. If the man is an occasional offender it would be better to allow him to sober up outside a prison; on the other hand if he is an habitual offender he should be isolated from alcohol for a considerable period, and healthful work in healthful surroundings should be given him. So apparent to the magistrates is the inadequacy of this treatment, that over one-half of the cases are discharged although the fact of their drunkenness is not questioned. The magistrate simply cannot provide for the treatment of the habitual drunkard because there is no city or state provision for such treatment.

CUMULATIVE SENTENCE

A direct sentence to the workhouse under the cumulative sentence law in New York city, provides that a person who has not been committed within two years shall be released upon the expiration of five days. If he has been committed once during the preceding two years he must serve twenty days. For every subsequent committal during two years he must serve a period twice as long as the period of his last detention, provided that such period is not longer than six months. This is in principle a good law, and about twenty per cent of all persons held by the court are so sentenced. In practice, however, several things prevent securing good results from this law.

In the first place there is no scientific system of identification at the workhouse, and identification is largely a matter of personal recollection of the officials of that institution. Another thing that prevents the cumulative sentence law from securing the results intended, is the fact that a person's record for serving time in default of payment of fine is not taken into consideration in determining the length of period he shall serve. Only direct commitments to the workhouse are considered. But even if a proper system of identification were rigidly enforced and a person's fine record considered a part of his cumulative record, New York city would still be deriving little benefit from the law under present conditions, because the workhouse is little more than a place of detention, and is

TREATMENT FOR DRUNKARDS: OPEN-AIR OR DARK CELLS?

How long will other states lag behind Massachusetts, Iowa and Minnesota.

wholly unsatisfactory for the treatment of habitual alcoholics for these reasons:

Opportunity for healthful outdoor work is very limited.

Remedial measures are not employed.

Abundance of sunlight and air, which is absolutely essential, is impossible in a house of detention where eight persons are crowded into a cell eight feet by twelve with only one window.

An intoxicated person who is without criminal tendencies is forced to associate with confirmed criminals.

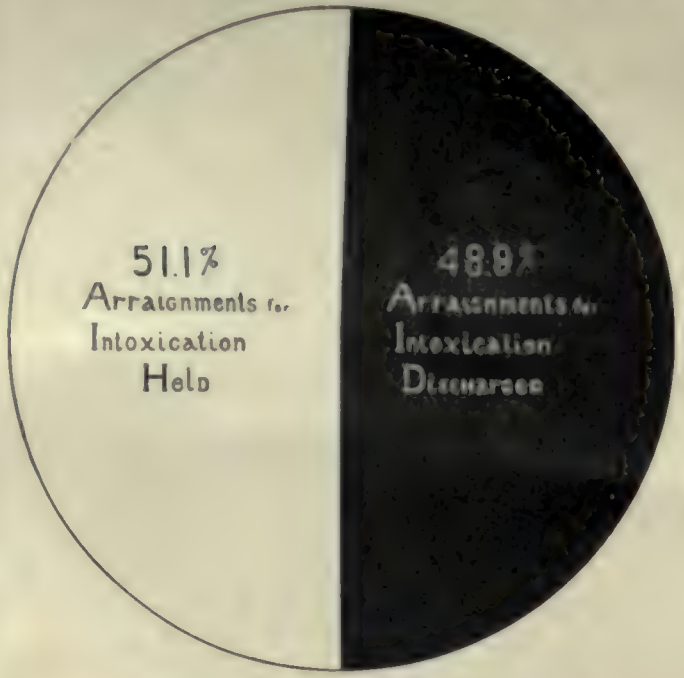
The net effect of an experience in the workhouse under such conditions is to create and confirm drunken habits rather than to reform them.

DISORDERLY CONDUCT

In addition to the persons arrested for public intoxication, a very large number are arrested upon other charges, particularly that of disorderly conduct, whereas the drunken condition of the person is in reality the cause of disorder and therefore of the arrest. For example, 62,225 persons were arrested in the Boroughs of Manhattan and the Bronx for disorderly conduct in 1908, a large percentage of whom were undoubtedly intoxicated when arrested. The court, prison and workhouse treatment of these is almost identical with that of persons arrested upon a charge of public intoxication.

MANY INEBRIATES NEVER ARRESTED

But there are a very large number of persons who are habitual drunkards who are never arrested and who never appear in court. In New York city about 7,000 of such cases are treated annually in the male alcoholic ward of Bellevue Hospital, and about 1,500 more in the Kings County Hospital. This leaves out of consideration the female alcoholic wards of those institutions and the cases which are cared for in private hospitals at the expense of the city. The so-called repeater or rounder is conspicuous in these institutions. The records of Bellevue Hospital, *e. g.*, show that there were 498 men treated for intoxication more than once between May 1, 1908, and May 1, 1909, and more than one hundred of these were treated from four to twelve times during that year. The means of identification used at Bellevue Hospital are also the personal recollection of the officials in charge of the ward, and there are doubtless many repeaters whom the records do not disclose. The effect of these repeaters upon the cost of maintaining the alcoholic ward at Bellevue is more strikingly brought out by the fact that during this year the total number of days' treatment of the 498 repeaters was 4,584, whereas the total number of days' treatment of 5,535 persons who do not appear to be repeaters was but 18,301. This shows that the average number of days' treatment for the repeater is about nine as compared with three and one-fourth for the patients treated but once, or in other words one-twelfth of the persons treated received nearly one-fifth of the days' treatment.



The following record of a patient thirty-six years of age, who has appeared twenty-three times in the alcoholic wards of Bellevue Hospital, is typical of the rounder's experience.

Another large group of persons whose condition is even more pitiable, never appears before the courts. This includes those who have families sufficiently interested in them to keep them from falling into the hands of the police and the hospital authorities and thus publicly disgracing their families. This is done at a cost of constant care and anxiety. Not only must the man be supported, but he interferes with the economic productivity of the family, and is a constant drain upon their energy and happiness. Often such families have means, but even then

ARRESTED DRUNKARDS

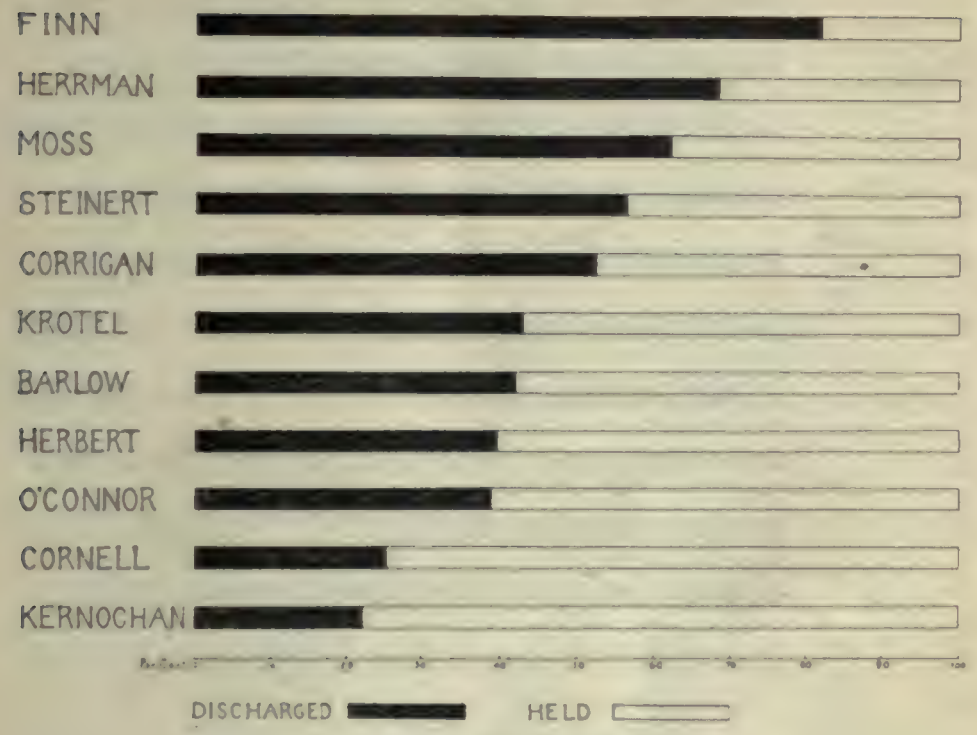
the case is almost equally bad. They would gladly place the drunkard in an institution under healthful surroundings where he could be isolated from alcohol, be treated medically, and be provided with healthful work, as little or nothing can be accomplished without more or less prolonged treatment in an institution. But there is in New York state no institution to which such a person can be committed for treatment, and there is, furthermore, no provision for the commitment of male habitual drunkards as such, to any institution. This is true for all of the states of the Union with but few exceptions. Massachusetts, Minnesota and Iowa have provided for state institutions, with commitment laws, and Connecticut, Vermont, Pennsylvania, Maryland and Nebraska have provided for the commitment of habitual drunkards to insane hospitals or other existing institutions. Physicians and friends of habitual drunkards in New York city sometimes inveigle them into Connecticut where they may be committed, but it is practically impossible to do anything with the vast majority of cases.



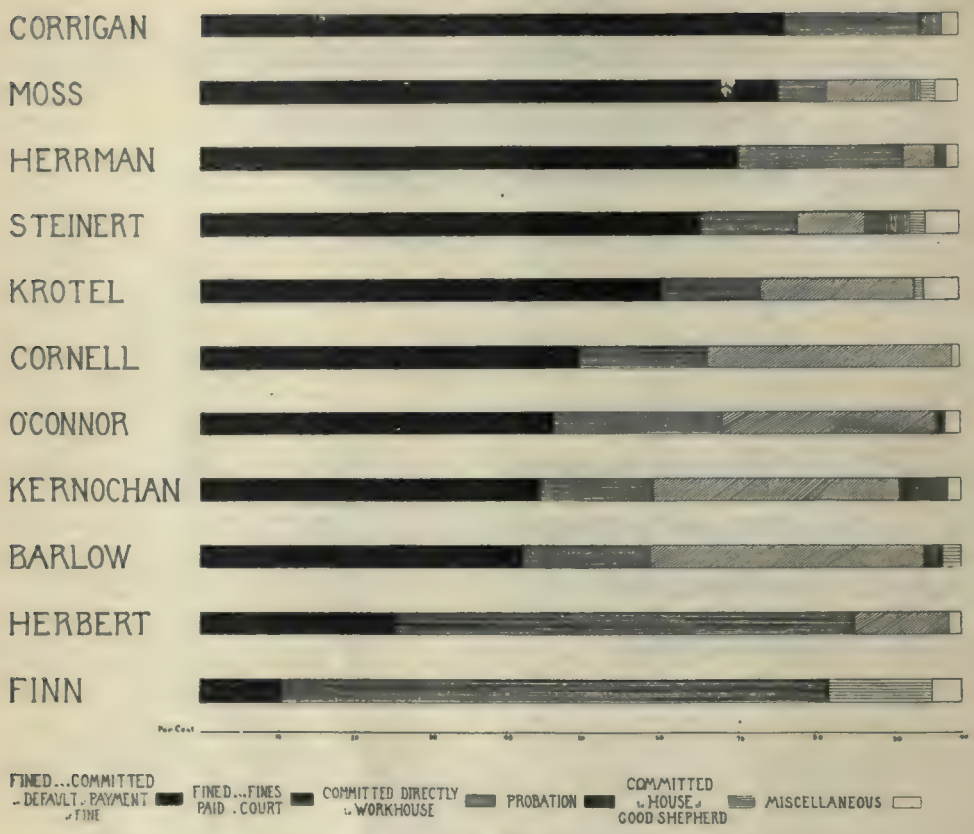
PRESENT METHOD A FAILURE

It is evident that at every point the present method of dealing with the problem is an acknowledged failure. Either nothing is done, in which case the man is a constant burden to his family, a menace to society and incapable of reformation or he is put through an in-and-out-process in the city prisons, workhouses and hospitals, the effect of which is to make rather than reform an habitual drunkard. It would be difficult for anyone to tell what good purpose can possibly be served by arresting a man who is drunk, depriving him of light and fresh air which he needs more than anything else, putting him on a diet of bread and coffee, when nourishing food is most needed, forcing him to be idle when healthful outdoor work is essential, compelling him to associate with confirmed criminals when, if ever, he needs good associates and friendly advisers, and requiring him to live with seven others in a room large enough for but one.

THE "ROUNDER"

The "rounder" is an inevitable product

DISPOSITION OF ARRAIGNMENTS.
Fourth district court, New York city, 1909.



CHANCES OF FREEDOM.
They vary from twenty to eighty per cent, according to the judge.

of our present system. One searches in vain through the records of the Police Department, the records of the magistrates' courts, the records of the district prisons, and the records of public charitable institutions, for exact information as to the number of rounders and the number of times which they appear. Testimony is universal, however, among the officials of these departments, that this group constitutes a very large percentage of the total cases dealt with.

The statistics for the workhouse for 1907 show that there were 10,370 commitments of persons committed only once, and 28,264 more than once. These 28,264 commitments represent only 7,101 persons. 12,176 were commitments of persons committed from six to ten times during the year, *i. e.*, there were during 1907 more commitments to the workhouse of persons committed from six to ten times than of persons committed only once. These statistics refer to commitments for all crimes, and unfortunately the annual reports of the Department of Correction do not show what percentage of these "rounders" were committed for intoxication. Intoxication, however, is pre-eminently the crime for which repeated commitments are made, and it is entirely conservative to estimate that at least fifty per cent of commitments of persons committed more than once are for intoxication. It is evident, therefore, that the "rounder" furnishes approximately 15,000 commitments to the workhouse each year. These represent approximately 3,500 persons who appeared in court and who were committed to the workhouse from two to twenty times during the year 1907.

These statistics cover only those who go to the workhouse, and only about twenty-five per cent of all cases held by the court go there; the remainder pay

DISPOSITION OF CASES.

DRUNKARDS' PENALTIES.
Hard or easy according to the judge.

fines or serve time in a district prison. There is no means of learning what percentage of this remainder are "rounders," as neither the court nor the prison records give this information; nor are there any data showing how many of the sixty per cent of all persons arrested for intoxication and discharged by the courts are "rounders." While it is impossible to estimate with any degree of accuracy the number of "rounders", yet we can conservatively say that the work of the courts in dealing with arrests for intoxication would be diminished by at least one-half, if this element were removed. It is probable, also, that the work of the alcoholic wards in public hospitals would be reduced about an equal amount, if the "rounder" were removed from them. The summary of a few individual cases, selected from a large number of similar ones recently secured by the State Charities Aid Association, gives some idea of the histories of these "rounders." In one case a man now sixty-one years of age has been in the workhouse at least sixty-two separate times and has spent 3,165 days in that institution at a total cost for maintenance alone of $1,858.53. Another case was found to have been in the workhouse thirty-four times, in the alcoholic wards of one of the city hospitals thirty-one times, in the Municipal Lodging House twice, in the almshouse once and in two other hospitals two times each. He had spent a total of 1,943 days in these various institutions at a total cost of $1,323.12. Still another case, a man about fifty-five years of age, has been in the workhouse thirty-four times, in the

almshouse thirty-five, in Metropolitan Hospital once, and in Bellevue Hospital once. He has spent 5,884 days in those institutions at a total cost to the city of $2,492.37. This man is blind and has a blind companion who has a record almost equally as long. Records from Cleveland, O., and Boston, Mass., show that it is not infrequent for persons to appear in the penal institutions of those cities from fifty to one hundred times, and one record recently obtained from the city of Utica shows that a single individual has appeared before the police courts of that city at least 160 times for public intoxication.

CROWDED COURTS

In the year 1909, 158,999 persons were arraigned in the magistrates' courts in the Boroughs of Manhattan and the Bronx. This means that cases are disposed of at the rate of ten or twelve an hour or receive about five or six minutes each. In the case of persons arrested for intoxication not as much time as this is given. There is, as a rule, no evidence submitted beyond the patrolman's assertions as to the circumstances of the arrest. No investigation is made as to the man's home surroundings, and the magistrate in most instances has no means of knowing whether he has a home or not, whether he has a wife and children or anything about his habits except in so far as he takes the arrested person's own word. With a crowded calendar constantly staring him in the face, the magistrate is forced to come to an offhand judgment with regard to the merits of the case. It is substantially accidental whether the arrested person secures adequate consideration or not, because of the mere physical lack of time and means for the magistrate to inform himself fully with regard to the man, his habits and surroundings, and the facts leading to his arrest.

INDICTMENT OF PRESENT METHODS

The following may represent in brief the indictment against the present methods:

1. A short sentence accomplishes nothing, either in reforming the individual or in protecting society, and should be abolished.

2. A fine, to be paid at once with the alternative of serving time in the city prison or workhouse, amounts to a short sentence with its pernicious effects, in sixty-seven per cent of all the cases; in the remaining thirty-three per cent in which fines are paid in court, they are usually paid by impoverished relatives to save themselves and the person arrested from further disgrace. The present practice with regard to fines should be abolished.

3. An ordinarily self-respecting citizen who becomes intoxicated loses not only his self-respect, but frequently his employment, by being publicly exposed, brought before the court, and perhaps sentenced to prison to associate with the most vicious type of criminal classes.

4. No satisfactory means of identifying perons arrested and convicted of intoxication is applied either in the police station, the court, the district prison or the workhouse, and there is, therefore, no differentiation in the treatment of the occasional and the habitual drunkard.

5. In nearly all of the states in the Union, there is no institution to which an inebriate can be committed for treatment and no provision for commitment.

6. The "rounder" in hospitals, police stations, courts, prisons and workhouses is an inevitable consequence of short-term commitments and petty fines.

7. Punitive rather than remedial measures are emphasized.

8. No investigation of the arrested person's vocation, habits and home conditions is made, although the facts with regard to these are quite as essential for an intelligent disposition of the case as the fact that the person was intoxicated.

9. The courts are overcrowded to such an extent as to make satisfactory disposition of the cases impossible. Many of these cases never ought to appear in court, but should be released after investigation by responsible agents of the court. The cases that properly come before the courts should not be allowed to come repeatedly during the same year.

10. Public funds are wasted, inasmuch as a large percentage of the cost of the

police force, the magistrates' courts, the city prisons and workhouses, and the municipal hospitals is due to the "rounder."

PROPOSED PLAN FOR NEW YORK

The indictment against the present methods is severe, but the facts upon which it is based are well known by all and are not controverted. There is entire agreement as to the failure of the present methods. There may be minor differences of opinion as to the best way to deal with the problem, but there is substantial unanimity as to the general directions in which changes should be made. The following plan is in its general features that proposed by Homer Folks, secretary of the State Charities Aid Association of New York, and the writer, and submitted by them to the standing committee on hospitals of that association. The plan was afterwards approved by this committee and by the board of managers of the association, including Joseph H. Choate, George B. Canfield, Mrs. William B. Rice and others. It was presented to the Legislature of the state of New York in March, 1909, but did not pass at that session. It was, however, introduced again during the session of 1910 and was known as the Grady-Lee bill. It was passed by the Legislature and is now law, Chapter 551, Laws of 1910. This is an enabling act and requires action by the Board of Estimate and Apportionment to make it effective. There seems little doubt that the plan, which has appealed to the Legislature of New York, to Mayor Gaynor and to Governor Hughes, as reasonable, will likewise appeal to the Board of Estimate and Apportionment as practical, humane and economical. The law provides for the creation of a board of inebriety of five members appointed by the mayor, which will have entire supervision of the problem of public intoxication and inebriety. The commissioner of public charities and the commissioner of correction shall be *ex-officio* members of the board.

EXTENSION OF PROBATION

The plan involves provision for extending greatly the principle of probationary oversight of petty offenders. The purpose of arresting a man for public intoxication, in addition to preventing him from injuring himself and being a degrading public example, should be to prevent him as far as possible from again falling into a similar predicament. In the case of occasional offenders this can, as a rule, be accomplished more readily through the influence of a probation officer than it can by brief imprisonment of the offender. The personal influence of an individual who has a broad sympathetic understanding of human nature is far better than imprisonment. This influence is doubly effective if the person on probation realizes that a violation of the terms of his probation leads inexorably to severer measures. But the probation officer under the plan proposed would be not only a "Big Brother" influence, but an investigator for the magistrate who is to try the case. He would gather data with regard to the man's habits and home surroundings, the number of persons dependent upon him, etc., for the use of the court. The same officers would also serve as parole officers for persons about to be discharged from the farm colony for inebriates.

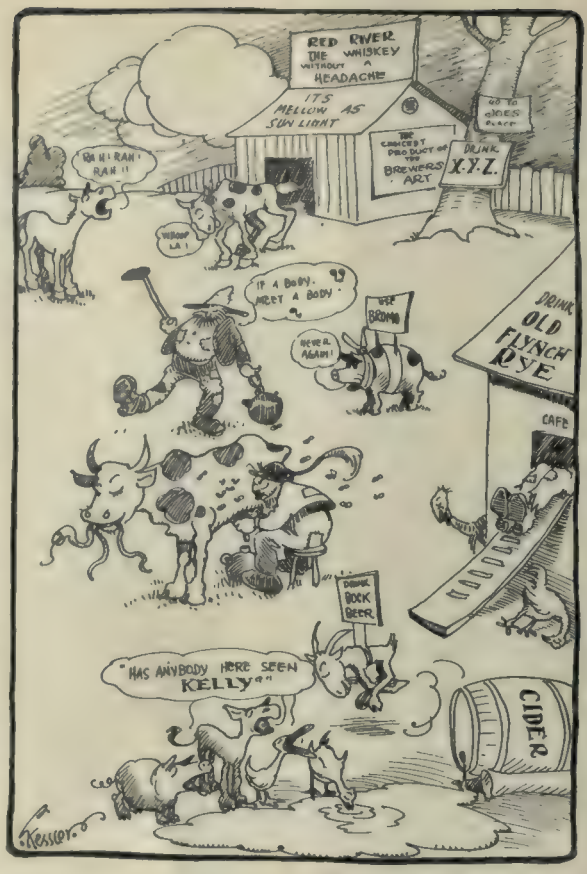
It is quite as important to provide for the after-care and supervision of a person who has been committed for treatment as it is to provide for his commitment. It makes possible a much earlier release, and at the same time assists him to secure employment, to fortify himself against old associations and old habits, and again to become a useful member of society. The knowledge on the part of the person released, that failure to abstain from the excessive use of intoxicating liquors will result in his return to an institution, acts as a very strong deterrent and assists him in getting readjusted without going back to his old habits.

In the new laws field officers are provided, who are virtually probation and parole officers. These will be under the supervision of the board of inebriety. Every arrest for intoxication will be reported to the board and a field officer will at once see the man, consult the central bureau of records, and if necessary make inquiries as to the truth of the man's

statements about himself. Any person placed on probation by the court for drunkenness will be under the supervision of one of these officers and, likewise, every person paroled from institutions under the jurisdiction of the board of inebriety will be under the supervision of these same officers. It is believed that this somewhat unique provision will make possible an expertness otherwise scarcely obtainable.

The principle of probationary oversight of offenders is comparatively recent in application, but the results obtained in Massachusetts, New York, and other states where the principle has had extended use are so satisfactory, that the principle may now be said to have passed the experimental stage. There is no class of offenders who are more in need of personal friendship, advice and cooperation than the persons who are habitual users of alcohol. To be successful, however, probation must of necessity be in the hands of broadminded, sympathetic and tactful persons. Even then it is not satisfactory in all cases of habitual drunkenness, but the plan proposed provides for severer measures where probation does not succeed.

NEED OF IDENTIFICATION IN COURT



The lack of identification of old offenders is responsible for much of the present haphazard treatment of persons arrested not only for intoxication, but also for other offenses. The magistrate before whom a person arrested for intoxication is brought has now no means of knowing whether the man is brought before the court for the first or the fiftieth time, except in so far as he may be recognized by the magistrate or some court official, and yet this is precisely the information which is of the utmost value in disposing of the case. The finger print system, which affords an easy and practical method of identifying persons, should be established either in the police stations or in the courts to which petty offenders are taken. There is some prejudice against the use of the system, but it is entirely groundless. There is no more reason why an arrested person should not place on file his finger prints, than his name, occupation and residence. The placing on file of finger prints is very different from the placing on file of the photographs of arrested persons, which enables anyone to identify and associate with the criminal class any person whose photograph is on file. The finger print record, on the other hand, is a sealed book to all but the expert officials under whose supervision the file is maintained, and to them, even, except upon the presentation of an additional finger print record, which they must carefully study and classify. The only real prejudice against the system is that of professional criminals, habitual repeaters, and their friends among the practical politicians, who have a real interest in preventing any system of identification from being put in practice. It may be that such a system could best be inaugurated in connection with the courts, to be used only after conviction, as this would not make it necessary for an innocent man to have his finger prints taken and recorded and would thus far remove the prejudice. If it were established in the courts, to be used after conviction, the magistrate would then have the record of each person brought to trial investigated, and the sentence could then be adapted to the case.

HOSPITAL AND INDUSTRIAL COLONY

There is no royal road to a cure for habitual alcoholism, but the best medical authorities are unanimous in their belief in the farm colony treatment. The prime necessities in any treatment are: isolation from alcohol for a continuous period of time, abundance of light and fresh air, therapeutic baths, and as much outdoor work as the patient is physically capable of, together with the strong personal influence of individuals who are recognized by the patients as definitely interested in their improvement. These conditions will be made possible by the new law, which provides for the establishment of a hospital and industrial colony under the jurisdiction of the board of inebriety. There will, in addition to hopeful cases, always be a percentage of chronic inebriates who will be practically incurable. The protection of society

from their constant example and their degenerate offspring is necessary both from economical and moral considerations. One of the members of the London County Council speaking of such cases, says:

> These cases are a constant nuisance to us, a constant danger, and a constant expense; they breed their like, and make others follow their bad example. Cautions from the bench are of no value, fines are useless and prisons make them worse. We must detain them for longer periods, and take care of them for their own advantage, under conditions which may also make them good. If we do no lasting good to the majority of the first drawn from the courts, we at least relieve the community of them for three years, a period which may be repeated if the first produces no satisfactory result. We keep them from making fresh cases for us to deal with in the future, and, so long as we have charge of them, we know what they cost us, which is not the case at present. Without any cures the debit and credit side, in my opinion, will balance; if we do happen to cure some of them permanently, well and good; we may call those cases sheer profit.

Kessler in St. Louis Star.

HOW THE FARM COLONY PLAN FOR DRUNKENNESS IMPRESSED A CARTOONIST.

Practically every consideration points to the necessity for a farm colony for the care and treatment of habitual alcoholics. Such a colony should be sufficiently large to allow a classification and segregation somewhat as follows:

1. More or less incipient cases, that is, persons who offer considerable hope of recovery, and who are willing to enter into the spirit of the institution, and work for their recovery.

2. Advanced cases which are practically incurable. This class should be largely self-supporting and an abundance of outdoor work should be provided for them.

3. Refractory cases which do not readily enter into the spirit of the institution and require more or less restraint. These should be committed to the institution on a long term and should be largely self-supporting. Their treatment should differ from that of the first two classes, in that they should be more closely confined, watched, and their privileges generally restricted.

A SERIES OF GRADED REMEDIES

It is plainly evident that the man who is arrested for the first time for public intoxication should receive very different treatment from the man who is repeatedly arrested. As soon as persons who have previously been arrested for intoxication can be accurately identified, it will be possible to provide a graded series of remedies. It is believed that the following furnishes a practicable and desirable plan.

1. *First Offense.*—Release a person arrested on a charge of public intoxication without bringing him into court, when it shall have

been determined that he has not been arrested within the preceding twelve months.

2. *Release on Probation.*—Release an arrested person on probation for a period not less than six months nor more than one year, if it shall have been determined that the person has been previously arrested within the preceding twelve months; or

3. *Fine in Instalments.*—Release an arrested person on probation for a period of not less than six months nor more than two years, and in addition impose a fine, permitting such fine to be paid in instalments in such amounts and at such times as the magistrate may determine, such fine to be collected by the probation officer; or

4. *Indeterminate Commitment.*—Commit an arrested person six months maximum to a farm colony for inebriates on an indeterminate sentence for a period not to exceed six months, to be followed by a period of parole not to exceed one year under the supervision of a parole officer.

5. *One Year Maximum.*—Commit any person to the farm colony for inebriates for a period of not less than six months nor more than one year, to be followed by a period of parole not to exceed one year, provided such person has previously been committed once to the colony.

6. *Two Year Maximum.*—Commit any person on an indeterminate sentence to the farm colony for inebriates for a period not less than one year and not more than two years to be followed by a period of parole not to exceed one year, provided such person has previously been committed twice to the colony.

7. *Three Year Maximum.*—Commit any person on an indeterminate sentence to the farm colony for inebriates for a period not less than two years nor more than three years to be followed by a period of parole not to exceed one year, provided such person has previously been committed three or more times to the colony.

8. *Violation of Probation.*—Commit any person who violates the terms of his probation to the farm colony for inebriates.

9. *Violation of Parole.*—Re-commit any person to the farm colony who shall have violated the terms of his parole from the colony, the term of commitment to depend upon the man's previous record.

10. *Unmanageable Cases.*—Commit any person who is refractory and does not yield readily to the discipline of the farm colony to the workhouse, penitentiary or other penal house of detention for the remainder of the period for which he was committed to the farm colony.

It will be noticed that the provisions of 2, 3 and 4 are left to the discretion of the magistrate, whereas the remaining provisions, with the exception of 10, work automatically.

COMMITMENT BY CIVIL COURTS

The states of Massachusetts, Connecticut, Vermont, Pennsylvania, Minnesota, Iowa and Nebraska already provide for the commitment of habitual drunkards by civil courts upon the petition of relatives accompanied by proper medical certification. Bills were introduced in several additional states during the past two years, providing for such commitment and a Departmental Commission in England, appointed to investigate the workings of the inebriates acts, has also recommended a similar step for Great Britain. In most of the states, however, an habitual drunkard cannot be committed to any institution unless he has previously been arrested and convicted of disorderly conduct. When a man has completely lost his self-control and is a constant burden to his family and friends, it should not be necessary for him to become so obnoxious to the community in which he lives as to incur arrest and conviction of disorderly conduct before he can be committed to an institution, where he may be isolated from alcoholic drinks and such treatment as may be needed be given him. A direct commitment to such an institution would at once be for the man's own good, for the good of his family and for the well-being of society.

PLAN NOT UNTRIED

The plan suggested is new only in that it combines features which have separately been thoroughly tested elsewhere.

Release of first offenders without their appearance in court has been the practice in Boston since 1905, and has worked admirably. Over one-third of the persons arrested for intoxication do not appear in court. The release of such persons after their cases have been fully investigated is most desirable, and there is abundant evidence of satisfaction with the working of the plan on the part of official authorities and students of the problem in Boston. There is no gain to be secured either in reforming the individual or in protecting society, by publicly exposing such a person and haling him before the court, where he is made to mingle with the most vicious type of offenders. Many persons so arrested are

ordinarily self-respecting, law abiding citizens and such a person's self-respect is lessened and he is much more likely to become callous and eventually an habitual drunkard by such association. He is, furthermore, likely to lose his employment and the respect of his fellow workers and acquaintances, in many cases where a prompt release would make it possible for him to get back to his work without much loss of time. It also makes for economy in that much time of the court and the police authorities is saved. This is particularly true in the case of the courts, as it relieves them of considerable unnecesssary work, and thus makes it possible for them to give much more time to the cases which really need to come before them. The release of such a person is also a mercy to his family, who suffer by having to pay fines, or by being deprived of his support during commitment, and most of all by the loss of his employment. The results in Boston undoubtedly justify the extension of the principle to other cities. Warren F. Spalding, secretary of the Massachusetts Prison Association, says: "So far as I know there is no criticism whatever of the law or of its administration. Those who know best are unanimous in saying that the effect upon those arrested is good; that it does not encourage carelessness in drinking."

PROBATION

Attention has already been called to the success with which probation has met in Massachusetts, New York and elsewhere. Over one-half of the states at present have laws making some provision for placing offenders on probation. It is, therefore, by no means an untried principle, and the desirability of extending its application is attested by all who are familiar with its workings.

INSTITUTIONS FOR INEBRIATE

Neither are special institutions for the treatment of the habitual drunkard, a new and untried experiment. In 1879 England passed the habitual drunkards act, which provides for the licensing of private retreats to which habitual drunkards can be committed upon their own application. The number of institutions established under this act has increased until there are at present twenty-two. In 1898 Parliament, realizing that the previous act did not make any provision for the inebriate repeatedly coming before the courts, passed an inebriates act which provides for the establishment of "certified inebriate reformatories" to which such persons can be committed directly. These institutions are either established by local authorities and supported by public taxation or are established and supported by philanthropic bodies. There are at present eleven such institutions in England. In addition to these the state has established two institutions for the treatment of inebriates. These are primarily custodial institutions, and receive the more refractory cases from the private retreats and the certified inebriate reformatories.

It is difficult to determine just what percentage of the total number of persons treated in these institutions are restored to useful positions in society. Naturally the private retreats report a much larger percentage of cures. The estimates of the various institutions relative to the percentage of persons restored vary all the way from thirty to seventy per cent, but it is evident that, even in the cases that do not reform, the English method of treatment is much more satisfactory than the American in-and-out-of prison process.

It is evident from this that England is thoroughly committed to the policy of maintaining special institutions for the treatment of inebriates. A commission was appointed by Parliament in 1908, to investigate the operation of the law relating to inebriates. The commission went into the subject fully and its report was printed in two volumes in December, 1908. The report of the commission recommends further extension of facilities for the treatment of inebriates, and an extension of the legal provision for the commitment of habitual drunkards upon the application of friends and relatives. The purpose of legislation with reference to the problem is well expressed by the report in the following quotation:

> The intention of the act is not explicitly stated, but presumably it is (1) to protect the community against inebriate offenders; (2)

to provide facilities for their reformation. The implication, from the terms of the act, is that both these objects are better attained by relatively prolonged detention than by repeated committal to prison, which has been proved useless by long experience. We thoroughly agree to this.

INSTITUTIONS IN THE UNITED STATES

While England has been constantly progressing toward the solution of the problem, the United States has been content with making a few sporadic and ineffectual attempts to deal with it. Massachusetts with its state institution and its provision for release of first offenders has made a more serious attempt than any other state. The article by Mr. Ford in this number describes the results obtained.

Other states in the Union are following the example of Massachusetts. The state of Iowa, in 1904, passed a law establishing an institution for inebriates at Knoxville, Ia. The following paragraph taken from the second biennial report of the institution indicates what results are being obtained.

> We feel that our work here has shown conclusively that there is help for an inebriate in an institution of this character. The number received during the biennial period ending June 30, 1908, was 774. From among this number we have received a report from something over 300 who never have gone back to drink, and are living up to the requirements of the law and report each month to the clerk of the district court.

The Legislature of Minnesota in 1908 passed a law providing for a state institution and it is now in process of construction. The state of Pennsylvania passed a bill in 1903 providing for the commitment of persons to inebriate institutions, and in 1909 both houses of the Legislature passed a measure providing for a state institution, but this was vetoed by the governor of the state because of the depleted condition of the treasury.

Measures providing special institutions for inebriates were under consideration during the last year in the Legislatures of New York, New Jersey and Connecticut, and the state of Michigan passed a law providing a commission of five members to investigate the whole problem.

CLEVELAND FARMS

The city of Cleveland has perhaps advanced further than any other American city in the provision of farm colonies to which persons arrested for public intoxication and other minor offenses may be committed. It has provided a farm containing approximately 1,000 acres of land. This makes possible a favorable environment and varied opportunities for good, wholesome, outdoor work for the inmates. Harris R. Cooley, formerly director of the Department of Charities and Correction, in response to inquiries with regard to the possibilities of the farm colony treatment for the habitual alcoholic, replied as follows:

> We have taken a number of the victims of drink to our farms, but we have no regularly established department for this work. We have to use the old legal machinery. The men are sentenced to the workhouse or House of Correction. There we give them treatment and as soon as they are in proper physical condition, we transfer them to the outside life and work at the Correction Farm Division of the Cooley Farms. These farms consist of nearly two thousand acres in one body and present a great variety of outdoor employment.
>
> I trust the time may come when we will have an indeterminate sentence for these men, so that we can hold them on the farm until they are restored to normal condition. We have one man who has been sent to the workhouse over ninety times for intoxication. About four months ago his legal time expired. I had a talk with him and advised him to remain at least for the winter on the correction farm. This he has done and he now says he will stay until we think he is able to stand. Another man who has a family was paroled on condition that he was to remain in the country. Our deputy draws his wages and his wife comes out after the money. From our experience with these cases, I am sure that we could bring good results in special departments established for this work, provided we could have the men sent to us for a sufficient length of time. I am exceedingly glad that other cities are taking up this work. For these men, who have fully demonstrated their inability to withstand the temptations of the city life, it is so much more rational to control their environment on a great farm in the country than it is to attempt to reconstruct and restrict the conditions of an entire municipality.

It is apparent that the tendency toward a plan similar in part or in whole to the plan which has been outlined is steadily

CLEVELAND'S CORRECTION FARM.

Outdoor work and few guards are better than crowded cells.

gaining ground and promises to become well nigh universal. This tendency grows inevitably out of the recognition of the wasteful and inefficient methods applied at present. The fact that so many different states are experimenting with different aspects of this problem is making it possible to develop a much more rational treatment of the unfortunate victims of alcoholic liquors than would otherwise be possible, and the next few years will undoubtedly mark a distinct advance in the solution of this difficult problem.

ALCOHOLISM AND DISEASE

CHARLES P. EMERSON, M. D.

SUPERINTENDENT, CLIFTON SPRINGS SANITARIUM, CLIFTON SPRINGS, N. Y.

The problem of the relationship which alcoholism bears to disease in general is an exceedingly difficult one for a physician to present in a manner which will satisfy many, if indeed any, of his readers. One reason for this difficulty is that, in the very heated discussions on alcohol delivered and published during the past few decades since "temperance" and "prohibition" became subjects of national importance, arguments borrowed from medicine have been urged as overwhelmingly convincing both against and for the use of alcohol in any form, in any amount, and for any purpose. It is only fair to say that these arguments have, for the most part, been borrowed from, not presented by, members of the medical profession, and that in the attempts to make the arguments convincing and yet simple enough for children to understand, the truth has at times suffered.

Please allow the writer to plead that he, a total abstainer, is guilty of an intemperate antagonism to the use of alcohol in all forms as a beverage and (excepting in the rarest cases) as a stimulant. Yet in this brief paper he will try to consider the subject impartially and from the medical viewpoint only. The problem is a very subtle one. That the use of alcohol is one of the most, perhaps the most, important factor in the causation of many diseases I am convinced. But to prove this, using medical data only, is difficult, since the evidence is not simple; much less can it be illustrated by the pictures of diseased stomachs, etc., which are used to frighten children into habits of abstinence.

In considering this question it is difficult, and yet it is quite necessary, to make a sharp distinction between the effects of the alcohol itself and the effects of certain other factors which also are usually present in the life of the alcoholic. These other factors may themselves be dependent on the alcohol habit, or they may be independent of it. It is they which contribute largely to the results for which alcohol usually gets all the blame. For instance, a healthy and fairly well-to-do man becomes a habitual drinker. This is soon discovered. He loses his good position, enters some more menial employment, and sooner or later is engaged in hard manual labor, much exposed to the inclemencies of the weather. He cannot afford the good living to which he is accustomed but now must eat much cheaper and coarser food. The problems of life become more difficult and in his sober hours he worries more and more. While intoxicated he yields to other temptations with venereal diseases as a natural result. Years go by, and finally the diagnosis of his physical condition reads as follows: Thickened arteries, Bright's disease, myocarditis (weak heart muscle), complete paralysis of the left side. His social diagnosis is: Poverty, an invalid wife, four children, one of which is epileptic, one feeble minded and one blind.

The temperance lecturer points to such a family and says "Behold the dire effects of alcohol." The physician answers, "True, alcohol deserves the blame of each and all of the injuries mentioned in these two diagnoses." For not one of these results need have happened had the man remained a total abstainer. And yet

October 1, 1910.

some of them might. In what sense was alcohol to blame for them all? Can we separate its direct influence from its indirect? I know that many object to any such distinction. But since these same persons cite the surely indirect results of alcoholism as undoubtedly direct, and as "sure medical proof," it is only fair to point out a distinction with a very definite difference. In the example given above it is perfectly possible that alcohol did not directly injure either this man's body or his family. The hard muscular work, the exposure to cold and wet, the poor food, the irregular habits of life, the worries, and the diseases he contracted, these might explain all and more too. But alcohol was nevertheless to blame. The part which it played was indirect, it was subtle, but it was the leading part. And yet to claim this we must depart from the strictly medical reasoning, as our friends understand this, although it is strictly medical as physicians understand it.

A MEDICAL OR A PENAL PROBLEM?

In the causation of physical disease the chief attack of alcohol is not against a man's heart, liver, or kidneys, but against the two most important citadels of his health: his mental life and his resistance to disease. Even a very small dose of alcohol has a direct toxic influence on the brain, which may be merely functional and temporary, but if repeated often enough becomes organic and permanent. Even the least result is a slight, temporary loss of self-control, a slightly and temporarily weakened will, a slight, transitory loss of authority on the part of the higher ideals. The lowered resistance to the invasion of disease and the accompanying lessened ability to recover from a disease are the result of the chronic poisoning of all the tissues of the body. This may be slight and temporary, but if the use of alcohol be continued long enough it will become more serious. These two most important effects of alcohol are direct, they are quite fundamental, and yet to the popular mind they are rather unconvincing.

Among the important subsidiary factors, which, as we have mentioned, produce many or perhaps most of the results usually ascribed to alcohol, are work, exposure to wet and cold, irregular hours, poor food, worry, and most important, immorality with its very frequent complication, venereal disease.

Hard manual work and alcoholism are very closely related. Not only is such work the only kind open to many habitual drinkers, but the effect of hard work on even the temperate laborer is a temptation to drink. And the same may be said of poor food, for the drinker gets little else, and the temperate man who finds only poor food at home is sadly tempted to patronize the saloon. That persons addicted to the use of alcohol expose themselves to cold and wet unnecessarily admits of no denial. Because of their benumbed sensibilities they remain in the wet and cold more than they would if sober; and they suffer more from this exposure than would temperate men under similar conditions. But it is also true that the temperate man who is for any reason much exposed to wet and cold is sorely tempted to drink. More important still is the close relationship between alcohol and immorality, which unfortunately for many is almost synonymous with venereal diseases, the princes among the destroyers of physical health! The first link of this chain of cause and effect is in very, very many (some say practically all) cases a slight degree of physical stimulation by alcohol together with the accompanying blunting of the fine moral sense. In the following years

PHYSICIANS PRESCRIBE OUTDOOR WORK.

of vice alcohol may not be any factor whatever. It is the start for which alcohol is so often to blame.

We must grant that there are many illustrations of the truth that almost any form of alcoholic drink may be taken in moderation throughout a long life, without, so far as we can see, impairing in the least the general health of the individual. But the effects produced by alcohol depend less on the inherent toxicity of the alcohol, and more on the condition of the person who drinks it. We may illustrate this by another common poison, that of typhoid fever; for it is the poison produced by the typhoid bacilli which causes all the symptoms of this disease. Expose four men to this poison in the same way (for instance, let them drink equal quantities of the same infected milk). The one man dies of malignant typhoid fever; the second, after a long, severe illness, gets well; the third has a short, mild course; the fourth remains perfectly well. The difference was not in the poison originally ingested (of course this poison increased tremendously in the bodies of the sick men); the original difference was in the men themselves, in their susceptibility to this poison. In much the same way equal amounts of the same liquor will have quite different effects on different men. Their susceptibility to alcohol will depend on two groups of factors. First, on inheritance, for the sons of drinkers especially, but the sons of men who overwork mentally under high nervous tension are also, as a rule, much more susceptible to alcohol than were their fathers. Second, the man who in a temperate climate lives a natural, easy, open-air life, with good food and few worries, usually can drink heavily with relatively little injury. This is the reason why the alcohol problem is today so important. There are now in our cities so many who work under intense nervous strain, with little sleep, irregular hours of meals, and with short or no vacations. These are especially susceptible to the toxic effects of alcohol; and yet these are the very ones whom alcohol as a stimulant tempts the most.

That some men can steadily for years use moderate amounts of liquor and show practically no injury as the result is no argument against temperance. We are now studying the interesting and important subject of healthy "infection car-

riers" and adjudge them dangerous. The "perfectly healthy" child whose throat and nose contain many virulent diphtheria bacilli is considered as a public menace, since, although thanks to his own good resistance he does not suffer in the least, he spreads the disease among his fellows, many of whom, more susceptible to this germ than he, will sicken and some probably die. And the same is true of the healthy typhoid bacillus carrier who is to blame for many of our widespread epidemics of this disease. Surely there is just as good reason for considering the man who can drink with little or no danger to himself as a menace, if the example of his drinking leads to the destruction of weaker fellow men.

We will now consider the direct physical effects which alcohol has on the body tissues. May we emphasize that alcohol harms because it is one of the many poisons. There are very few diseases which are wholly due to alcohol. One of them is a form of "peripheral neuritis," that is, of temporary weakness, even paralysis, of hands and feet lasting from a few weeks to months. A somewhat similar condition results from chronic lead poisoning while in other patients it follows diphtheria, typhoid fever or other acute fevers. The alcoholic form is sometimes, but rarely, associated with mental disturbances which no other poison produces. And of course chronic alcoholism is the sole cause of delirium tremens, an acute mental upset with characteristic symptoms.

Alcohol is the chief cause of the common form of one important liver disease, hardening or "cirrhosis," of the liver. And yet other rare and yet equally serious forms of cirrhosis of the liver are not the result of alcoholism.

KEEPING DOWN THE COST.
Work by patients helps maintain the institution.

The above are perhaps the only conditions for which alcohol is chiefly directly responsible. In the causation of the many other diseases for which alcohol is commonly blamed it does play an exceedingly important rôle. And yet like that of the shrewdest criminals this rôle is a hidden one.

Alcohol was believed to be a very important cause of hardening of the arteries or "arteriosclerosis." This condition, directly or indirectly, causes the death of the great majority of persons who have reached middle age; for arteriosclerosis is the chief cause of the common forms of chronic Bright's disease, of weakening of the heart muscle (chronic myocarditis—not valvular heart disease), of apoplexy, etc. There is now some doubt that the habitual use of alcohol does directly cause arteriosclerosis; certainly if it does it is not a very important cause, for hard physical work, worry, long continued nervous strain, overeating, lead poisoning, gout and especially primary Bright's disease and venereal diseases are by far more important causes of this condition.

Habitual drinking is one of the important causes of chronic gastritis, a very common chronic stomach trouble. Errors in diet and careless habits of eating are probably more important causes. These stomach troubles cause in their turn various "dyspepsias" and disturbances of malnutrition. Heavy beer drinkers have enlarged stomachs and enlarged hearts, but these seem due to the quantity of fluid consumed rather than to the alcohol there is in it.

Alcohol is blamed for very many cases of acute Bright's disease (acute nephritis) since this so often directly follows a "spree."

And yet the direct cause is not so much the alcohol as the exposure to cold and wet, for drinkers expose themselves unnecessarily, and while intoxicated are especially susceptible to cold. Exposure for any reason to cold and wet is one of the commonest causes of acute Bright's, while any poison in large enough doses, as carbolic acid, turpentine; overdoses of many strong medicines, and the poisons of many of the acute fevers, especially those of scarlet fever and diphtheria, are important in this list. Considering the amount of alcohol drunk it would seem a very rare cause of acute nephritis, and some even deny that it is ever a direct cause. There is more evidence that the habitual use of alcohol is a direct cause of another form of Bright's disease (subacute parenchymatous nephritis), and yet it is not as important as a cause of this as are malaria, tuberculosis, etc. But certain forms of chronic Bright's disease are far more common than are the above, and of these alcohol may possibly, but not certainly, be an important cause. It surely is in conjunction with other factors. The most important cause of this condition is artediosclerosis, and so alcohol, in addition to its direct responsibility, is also to blame in just so far as it is responsible for the thickening of the arteries. Certainly if the patient already has a chronic nephritis the use of alcohol will make it much worse.

Heavy drinkers suffer from nervous diseases which are the results of the direct action of alcohol on the sensitive nerve tissues. Some become epileptic, some insane, while others show a slow dementia. But these cases are not very common considering the number of hard drinkers. And the chronic alcoholic is in considerable danger of mental breakdown in case of illness or accident, for although he may not have been a hard, although a steady, drinker, yet an accident of any kind, such as a broken bone or a fever, may precipitate delirium tremens so suddenly that the injury or fever is quite overlooked.

But by far the most important result of alcoholism is a general reduction of the vitality and resistance of the body, and this is synonymous with an increased susceptibility to disease. We all are frequently exposed to diseases, but we do not contract them, thanks to our "resistance." But drinkers are more susceptible than are normal persons to almost all diseases. This is well illustrated by tuberculosis, for it is variously estimated that from fifty to eighty per cent of all consumptives were formerly victims of chronic alcoholism. Chronic alcoholics also cannot recover easily from disease; that is they lose in the fight for life. The percentage of deaths in pneumonia, for instance, is much higher among alcoholics than non-alcoholics.

The evil effect of alcoholism is much better seen in the children than in the parents. This transmitted injury is seldom illustrated by the "fearful examples" which are held up for warning, such as insanity, epilepsy or imbecility, although these occur much too often, but usually it is merely a slight reduction of the resistance of these children to disease and an increased frailty under the wear and tear of ordinary life. Their bodies seem not made of as good material as normal; for instance, they develop arteriosclerosis more easily than did their parents. Finally, the children of alcoholics are far more sensitive to the effects of alcohol than were their parents. To their fathers alcohol dealt invisible wounds which must be suspected rather than demonstrated, but them it destroys.

In conclusion, we would repeat that alcohol is one of the most, if not the most, important factor in the production of general disease, and is dangerous since its influence is so insidious, so difficult of demonstration. Its main attack is on the nervous system; its trusty lieutenants are the weakened will and the blunted moral sense; the actual blows to the body are struck by the weather, the work, the food, venereal disease, etc., which the patient must endure. Its immediate relationship to disease cannot truthfully be demonstrated by colored plates of diseased organs but its relationship is nevertheless fundamental.

The cure of alcoholism is very difficult both theoretically and practically. The treatment must be directed primarily

to the will, and here the insidious danger of alcoholism is apparent, for alcohol injures this first, man's one means of defense. But the treatment should be studied out carefully with great attention to detail, for sentiment too often directs it. There is no drug cure. Drugs may for a while cause a disgust for liquors but that is all. The environment is of great importance. The patient is best treated under conditions (in an institution if necessary), where he is protected from temptation at those times, which are quite sure to occur, when the will is too weak to resist. Alcohol weakens the will by poisoning the brain. The man may have an intense desire to overcome the habit, but the ability to will to resist temptation will depend much on physical conditions, the health of the body as a whole and of the nervous system in particular. For that reason the physical condition should be improved. Probably every organ is in some measure injured. The diet, the routine of life, a regular occupation (easy work in the open air is best), all need careful direction. And the man should stay under these conditions long after he appears entirely well, for the future will depend more on the "reserve" a man has than on his superficial condition and honest intentions when dismissed from treatment. Granting that a man inherits a strong body there is good chance for cure; but the son of a drinker (even a moderate one) has most of the chances against him.

But from the very first the fight is really mental. Not only must the patient want to overcome his habit (they practically all do) but he must be able to will to resist temptation, and the strength to will is a question of both the mental and the physical. But by the mental we include the spiritual, first and foremost. The rescue mission workers, the priests and the clergymen, these hold a record for genuine cures of alcoholism of which physicians may well be envious. They direct their attention to the man's mental, moral and spiritual life, paying particular attention to his environment. The will is alcohol's chief point of attack, and there must the main defense be made. The man realizes his need of a strength not his own, and with this he often wins.

THE FOXBOROUGH "CURE."

THE FIRST FARM COLONY FOR DRUNKARDS

JAMES FORD
INSTRUCTOR, DEPARTMENT OF SOCIAL ETHICS, HARVARD UNIVERSITY

Massachusetts, owing to its large urban population occupied chiefly in mills, factories and shops, has found the problem of drunkenness serious and has devoted much attention to both penal and curative treatment. Under the local option law alcohol in its various forms has ordinarily been fairly accessible in dis-

BOWERY TEMPTATIONS FOR THE DOWN AND OUT.

tricts where population is aggregated. Strict laws relative to public behavior, which find "intoxication in a public place" to be a misdemeanor, although usually interpreted by the police with fair latitude, result in the apprehension of such intoxicated persons as appear unable to care for themselves, quarrel, stagger, or otherwise render themselves publicly obnoxious. In 1909 there were 90,550 arrests on the charge of drunkenness, of which 45,124 were within the city of Boston. Drunkards are frequently arrested on a charge of disturbance of the peace, petty larceny and more serious crimes. Indeed ninety-four per cent of all the prisoners of the state were recorded by the penal commissioners in 1909 as intemperate by habit.

PRACTICE IN MASSACHUSETTS

The plan of criminal procedure varies widely throughout the states of the United States. The Massachusetts plan involves release, probation, fine, suspended sentence and imprisonment. After the person arrested has recovered from his intoxication, he is permitted to "make a statement in writing, . . . giving his name and address, setting forth what persons, if any, are dependent upon him for support, his place of employment, if any, and whether he has been arrested for drunkenness within the twelve months next preceding, and requesting to be released from custody." If the probation officer, after looking up the man's previous record, believes his statement to be true and finds that he has not twice before been arrested for drunkenness within the preceding twelve months, he may release him forthwith without arraignment. In 1909 of the 90,550 arrested 78,450 made the optional statement, 67,821 were adjudged to be true, and 33,798 were released without trial.

The next step of the criminal procedure in order of severity is probation. The purpose of probation is threefold: first, to secure evidence supplementary to the prisoner's statement of his home and of his industrial and social environment; second, on the basis of this evidence to advise the judge as to the proper disposition of the case; and third, by sympathetic counsel based on a thorough understanding of the prisoner's personal problem, and by modification of the pris-

RECRUITS FOR THE BREADLINE.
Drunkenness helps swell the army of alms seekers.

oner's environment through putting him in touch with new constructive agencies—school, church, club, employment, etc., adapted to the case in question—to deflect him permanently from intemperance. Probation, though perhaps more concerned in Massachusetts with juvenile delinquency, was applied in 1909 to 8,177 cases of drunkenness.

The fine—ordinarily of five dollars, sometimes ten dollars—was applied to 23,667 cases. Of those fined 10,433 were imprisoned for non-payment. Since 1905 Massachusetts law has permitted, at the option of the judge, the suspended sentence, which allows the prisoner, if unable to pay his fine at once, to earn the fine and pay it to the probation officer. The suspended sentence has been adopted in certain courts and has been highly successful. Statistics are not available.

Imprisonment in local jails and county houses of correction was ordered in 8,709 cases. 10,433 other cases were imprisoned for from eight to twenty days in jail or houses of correction for non-payment of fine. Of the 8,709 sentenced to imprisonment, 8,298 were sentenced for a term of less than six months, 396 for from six to twelve months and but fifteen for one year or more. Indeterminate sentence was ordered for 2,472 men and 234 women at the State Farm, for fifty-one men to the Massachusetts Reformatory and for ninety-five women to the Reformatory Prison for Women. Of the total 21,994 prisoners committed for drunkenness during the year, 19,142 were thus sent to jails and houses of correction—chiefly on short terms—and only 2,852 received indeterminate sentence to the better known reformatory institutions of the state.

Other cases appeal to superior court or are placed on file, which is equivalent to release from the court. No uniformity in procedure obtains among Massachusetts courts. Each of the above measures is applied with surprising variation to young and old offenders.

CRITICISM OF MASSACHUSETTS

Granted the applicability of penal measures to drunkenness certain comments on the above disposition of cases may be indicated. Release, which was

applied in thirty-six per cent of the cases arrested, is usually a wise procedure for first offenders, because for them arrest, followed by a night's imprisonment and admonition from the probation officer, is often an adequate deterrent from repetition of the offence. Release may, however, encourage inebriety in old offenders, who either escape detection within a given court or are arrested within different jurisdictions—for an insufficient probation staff seriously curtails co-operation between courts. Probation, which is essential to incipient cases, was applied in 1909 to but eight per cent of the drunkards arrested. The recent State Commission on Probation under the able direction of Deputy Commissioner Mulready is continuously strengthening this department in so far as their small staff and limited means permit. New and improved records and improved quality of officers have already resulted.

The fine, which is used almost exclusively in certain courts, is the most economical punitive measure for the state, if the incidence of the fine is upon the offender himself. If the fine is paid by innocent friends or by the drunkard's family, this measure may cause suffering and prove utterly unjust. Furthermore, if the prisoner or his friends cannot at once pay the fine and imprisonment ensues, the prisoner and his family are doubly punished and the state loses both the fine and the cost of the drunkard's maintenance in prison. The alternative provision, suspended sentence, has been adopted somewhat slowly by Massachusetts judges. It is advantageous in that it saves the state both the fine and the prison cost, and especially because it places the prisoner once again in the hands of the probation officer for constructive treatment.

Imprisonment for drunkenness, whether as result of direct sentence or of nonpayment of fine, is an exceedingly serious measure. It may deprive the drunkard's dependents of his earnings, may result in the loss of job by the drunkard, thus occasioning a dangerous period of unemployment upon release. Association with criminals in the prison may aid in making the drunkard a criminal. Prison is necessary for vicious, criminal or degenerate drunkards. It may mean ruin for certain types of intemperate workingmen.

Statistics of recidivism in prisons,

THE HOMELESS ARE NOT ALL DRUNKARDS, BUT MANY DRUNKARDS ARE HOMELESS.

which record 14,440 cases recognized as imprisoned within the same institutions two or more times and 1,262 cases seventeen or more times, are proof of the ineffectualness of the correctional system for certain types and afford justification of the adoption by the state of curative measures.

SPECIAL INSTITUTIONS

Throughout the past century there has been growing realization that intemperance, at least in certain of its forms, is either a disease or the expression of diseased mental or physical condition. In 1868 a joint special committee was appointed by the Legislature of Massachusetts to "consider the matter of inebriation as a disease, and the expediency of treating the same at Rainsford Island." The committee approved of the hospital treatment of inebriety, but was "not of the opinion that such an institution, established and supported exclusively by the state, would realize the best results." It found Rainsford Island to be an unsuitable location, and urged that "if humane and philanthropic persons would found such an institution the state could well afford to be a most liberal patron." Leave was asked to report to a subsequent Legislature but no decisive step was taken.

The culmination of years of agitation was reached in 1885 when the State Board of Health, Lunacy, and Charity, after a number of public hearings and consultation with medical experts, recommended to the General Court that an institution for inebriates be established by the state. The quality of this report is evidenced by the following extracts: "... discrimination should be exercised by the courts in reference to the character and reputation of those committed to it (the asylum). ... The expense of their maintenance in the institution so far as it exceed their earnings from farm labor and other occupations should be borne and paid by the state, except that each inmate having property or means of supporting himself should be required by law to pay for his maintenance out of his estate. ... The situation of such an institution should be in the country remote from any large town, but near the line of some railroad, and a tract of good farming land, of at least 150 acres in extent. ... The sale of intoxicating liquors within a radius of several miles of the institution should be forbidden under a penalty. ... As occupations ... farm labor, gardening, and readily acquired and light mechanical employments are recommended." This report and contemporary agitation resulted in immediate provision for inebriate patients in hospitals for the insane. In 1889 the establishment of the Massachusetts Hospital for Dipsomaniacs and Inebriates at Foxborough was authorized, and in 1893 the hospital was opened.

COMMITMENT AT FOXBOROUGH

In the early part of its history the Foxborough Hospital received inebriates of confirmed and even vicious or degenerate types, until workhouse methods were necessitated. By 1907 the institution had fallen under popular disapproval; a state investigation was made, and although no specific delinquency was found in the old management the hospital was entirely reorganized. A new board of trustees, carefully chosen to represent the state probation service, the medical and legal professions and general citizenship, was appointed. Robert A. Woods of Boston was made chairman of the board. The services of Dr. Irwin H. Neff as superintendent were secured. To his able direction and to the initiative of the present board of trustees the greatly increased scope and effectiveness of the work of the Foxborough State Hospital may be ascribed.

Hospital treatment for inebriates is based on the assumption that inebriety is a pathologic state and amenable to curative treatment. It is not assumed that all cases of drunkenness are pathologic. On the contrary, the recent special report of the board of trustees of the Foxborough Hospital carefully classifies drunkards into three main groups: the accidental drunkard, the occasional drunkard, usually of the holiday or week end type; and the habitual drunkard. It is only within this last group that intem-

MASSACHUSETTS TEACHES DRUNKARDS VARIOUS USES FOR WATER.

perance is commonly beyond the will of the drunkard and that curative rather than correctional treatment is demanded. Even among habitual inebriates—the victims of a morbid craving for the drug, alcohol—not all cases are apparently to be permanently benefited by hospital treatment. Indeed there is among drunkards a large proportion of individuals in whom intemperance is but an expression of prior mental or physical degeneracy. Others have caused in themselves mental impairment through years of excessive drinking and are, in just so far, unfit cases for hospital treatment. There is another large group, too, who have begun drinking in excess only after they are past the prime of life—hoping perhaps by stimulants to retain their ebbing powers. Owing to the very physical and mental breakup of this period—technically known as the period of involution—the patient is seldom able to co-operate in his own cure, thus rendering hospital methods of slight avail. The most hopeful case for hospital treatment is rather the normal man whom bad hygiene, poorly cooked food, domestic troubles or business worry has driven to the constant use of alcohol, until ever increased craving and ever decreased vitality result in true narcomania. This group and the periodic drunkards for whom hospital treatment is valuable during attacks form the most curable classes of habitual drunkards. Experience has shown, however, that it is unsafe to term any type of habitual inebriate incurable until after prolonged inspection. For each new case is a problem in itself and must be considered according to its own history and make-up, hereditary and environmental.

METHODS OF COMMITMENT

There are three ways in which patients are admitted to the hospital. The first and oldest method is commitment by the court upon petition of friends or relatives, followed by medical examination. The second method is the voluntary application of the drunkard; seven per cent of all admissions to the hospital are of this sort. A third and recent method, designed to effect easy co-operation between the hospital and the criminal court, is the placing of young habitual drunkards on probation on condition that they spend a certain specified period at the hospital. In this way it is hoped that cases arrested for drunkenness and recognized by the probation officer as pathologic cases may be saved from penal measures and cured of inebriety while the disease is yet young.

MEANS TO RESTORE DRUNKARDS

The means by which the hospital restores the inebriate to manhood and to economic productivity vary necessarily with the case. But certain rules are almost universally applicable. The patients should be restored to physical health by proper nourishment, sanitary conditions, regular hours, and out of door work and recreation. Diseases of the body, which sometimes largely condition inebriety, must be cured by proper medical care. All this, however, has been done for many years by our better prisons and reformatories without curing chronic inebriety. For in addition to rebuilding the body it is essential to strengthen the will to resist alcohol and to prepare an environment favorable to the free play of this will. The mental treatment of patients takes the form of daily interviews, whether in the office of the superintendent and assistant physicians or in the field, workshop, or recreation rooms. The interest of the patient in his case is sought and co-operation in the cure solicited. If such co-operation can be secured the patient's case is a hopeful one. If, after the strength of body has been restored, the mind still fails to respond to the suggestion of cure, the chances of lasting improvement are very slight. For this very reason voluntary cases are ordinarily hopeful in that they imply the consent of the patient. This further accounts for the less frequent curability of the prison rounder type in whom inherited degeneracy or years of acquired depravity render mental response impossible.

Shortly after the admission of the patient to the hospital, when the first effects of debauchery are healed, there comes a period of restlessness, characteristic of convalescence, in which the patient wishes to get away. Despite repeated experiences to the contrary, he sincerely believes he will not drink again, at least not in excess. In this trying period the educative process is begun. The body must be trained to regularity of habit, a recognized bulwark against intemperance; the mind must be made to see the situation and its remedies; the will must be induced to co-operate, and, not the least important, an occupation must be found for the patient, which will keep his interest and his health and better prepare him for employment upon his withdrawal from the hospital. Many patients have been casual laborers. For these the hospital should become so far as possible a trade school, where the patient may become proficient at a trade in which the work is regular and the remuneration adequate. Men already skilled at a trade can often be kept at that work at the hospital, or may at the discretion of the superintendent be put to work at something entirely different, thus to awaken fresh interest and give them a new grasp on life. Out of door work, such as farming, horticulture, grading of lawns, care of poultry, live stock and stables, erection of buildings, and construction of sidewalks and roads, is often most desirable and at the same time can be conducted to the ultimate profit of the hospital.

Hospital treatment is desirable, in that it permits the reconstruction of the drunkard apart from his old associates and influences. A hospital is, however, at the best an artificial environment and therefore a protracted stay for most patients is inadvisable. On the other hand, there is danger of a too sudden return to the old or even to a new environment, away from the sustaining influences of the hospital. This danger has been met by a new and exceedingly important measure initiated last year by the board of trustees of the Foxborough Hospital—the establishment of an out-patient department.

AFTER-CARE OF CASES

The first duty of the out-patient physician, an office now held by Dr. John A. Horgan, is to become acquainted with the patients while in the hospital. The next requisite step is a visit to the patient's home while he is yet in the hospital. This is done both as a means for acquiring added working data relative to the case and, quite as important, for the purpose of instructing the family in the nature of the disease, inebriety, thus preparing them for the proper reception of the patient upon his return home.

REAWAKENING INTEREST IN WORK.

In this way querulousness or its opposite, weak indulgence of the drunkard by wife, mother or other members of the household, has been changed into intelligent aid, based upon an understanding of the patient's strength or weakness.

A small degree of protection of the patient from the presence of alcohol on the family table, or from old, destructive associations will render the determination made in the hospital more possible of fullfilment, even though other conditions remain to some degree adverse. Beyond the protection of the patient lies the formation of a truly constructive environment. Through the family or the out-patient physician work is found ready for the patient on his exit from the hospital, so that no period of unemployment and consequent discouragement may destroy the newly acquired self-mastery. Sometimes conditions require a new trade, but in general it is believed that a patient is not cured who is unable to return to his original industry and remain abstinent. The effort is made, however, to place the patient among helpful friends, in a temperance society, or church, or fraternal organization where better influences predominate. Often some individual is found who will represent the out-patient physician during his absence. Meanwhile visits of the out-patient physician or visits to the hospital at requisite intervals by the patient keep alive the influence of the hospital until the patient is firmly established in the outer world and abstinence has become habitual. Sometimes a patient has been overconfident of his powers and has left the hospital too soon. In such case no effort is made to retain him for there is no advantage in restraining a patient when he is determined to leave; he is no longer amenable to cure. If, however, the out-patient physician finds him after an unsuccessful battle with the old environment, he may be may be able to persuadé him to return to the hospital, and thereafter a permanent cure may be effected.

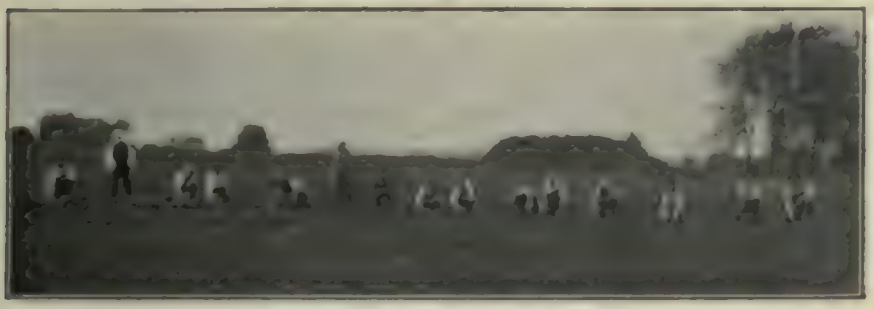
The out-patient physician thus is the link hitherto lacking between the hospital and the outer world. He continues the treatment after the patient has left the hospital and prevents miscarriage of the hospital's efforts. As yet the hospital has but one out-patient physician, but in May, 1910, for example, he made in all forty-four visits to thirty-four homes of patients about to receive final discharge. He made 114 visits to the homes of sixty-six patients on leave of absence, and made thirty-one visits to the homes of patients already discharged.

Not content with the prevailing mode of penal treatment of drunkards in Massachusetts, or with the type of patients committed to the hospital, the trustees of the Foxborough Hospital have undertaken various measures to secure the requisite treatment for each type of drunkard. First, physicians of the state have been instructed through circulars and conferences of the hospital's methods and the type of cases desired. Second,

social workers after conferences and visits to Foxborough have begun to send proper cases and to work with the out-patient physician in the oversight of discharged patients. Third, the judges and probation officers have met with representatives of the hospital, and especially with the out-patient physician, to whom in many instances prospective patients are turned over for inspection before being committed to the hospital. In this way old, degenerate and otherwise hopeless cases, who by their presence in the hospital would bring an atmosphere of despair, are often eliminated at the place of arrest and younger or more desirable cases are increasingly received.

AN OLD FARM AS A REFORMER.

Administrative building Massachusetts State Institution at Foxborough.



NEW PLANS UNDER WAY

In 1909 it became evident to the Foxborough trustees, that a preliminary study of the conditions of drunkenness and of the prevailing modes of treatment within the state was essential, before radical changes of method and proper co-ordination could be effected. With the authorization of the Legislature a special report of the trustees of the Foxborough State Hospital, entitled Drunkenness in Massachusetts, was prepared and presented to the General Court of 1910. It contains a survey of drunkenness in Massachusetts and of the present ways, penal and curative, of dealing with it. Out of conditions as found, the board determined that certain immediate steps were necessary to adapt treatment to each type of case in question. Following the classification of drunkards into accidental, occasional and habitual, and the sub-classification of criminal and non-criminal, the board urges in general the release of accidental drunkards, and probation, fines, suspended sentence and rarely short term imprisonment for the occasional drunkard. The commonwealth is urged to abandon the practice of imprisonment for non-payment of fine. For habitual drunkards, if vicious, criminal or degenerate, indeterminate sentence to the State Farm is deemed best. For non-criminal habitual drunkards, if hopeful cases, treatment at the State Hospital by one of the usual three methods of admittance is recommended. The present hospital at Foxborough, however, is found to be inadequately equipped for the reception and requisite treatment of all eligible alcoholic and drug cases. Two other classes, inebriate women and incurable non-criminal men, are found to be ignored or wrongfully placed in prison or hospital under prevailing methods. It was recommended, therefore, that the state appropriate money for the purchase of a large tract in three adjoining townships, whereon a new hospital for men, a hospital for women, and a farm colony for incurable male inebriates might be erected through the labor of inmates. The Legislature appropriated $50,000 and land is now being sought. The three institutions as planned are to be under uniform management, a plan beneficial both for deeper study of the nature of inebriety in its various phases and for economy in finance.

When the plan is finally in use it will be possible for the hospital and its adjuncts to receive all pathologic cases whether male or female, curable or incurable. The incurable will be sent on indeterminate sentence to the farm colony and kept at productive labor apart from criminals and under medical care.

Transfer of cases from the farm colony to the hospital will be rendered possible under this uniform superintendence of cases which prove curable. It is hoped that all cases adjudged to be habitual drunkards, actual or incipient, will thus ultimately be sent either to the hospital on probation or to the colony on sentence, Under medical supervision they can be sub-classified and each case placed under the influences which it needs. Cases which prove refractory could be moved to the State Farm or to a house of correction.

By this plan, comprising release, probation, fine, suspended sentence, imprisonment for arrested drunkards, and hospitals with out-patient department and farm colony for both voluntary and court cases, it is hoped that the manufacture of criminals and sots from pathologic drunkards may cease, and that each type of drunkard, pathologic or wilful, may be brought to the peculiar corrective or curative treatment which his individual case demands. In this way needless drunkards can be eliminated from our courts and prisons, and a fair proportion of cases restored to health, economic productivity and valued citizenship.

IOWA STATE INSTITUTION FARM.
A skirmish line in the battle with inebriety.

SUNDAY PLAY[1]

JOSEPH LEE
PRESIDENT PLAYGROUND ASSOCIATION OF AMERICA

I believe our Sunday laws forbidding play and sport are in the main an evil. I believe that they do much harm and prevent a great deal of good. I believe that games and play on Sunday, under proper restrictions as to time, place and noise, should be not only permitted but encouraged. I believe that the provision in our game laws forbidding fishing and shooting on Sunday is wrong. It is a rich man's law. It would be better to forbid these forms of sport on any day except Sunday, so as to reserve the game for the one day in the week when the average citizen can go after it.

That Sunday is to a great extent, for city children at least, a day of lawlessness and demoralization cannot, I think, be successfully disputed. There are, so far as I am aware, no statistics upon the point, but I have gathered a considerable amount of testimony from social workers to the effect that Sunday is at present the especial day for the planning and carrying out of mischief and lawbreaking in various forms, and that in particular it is, among city boys, very largely devoted to gambling. Whatever the ex-

[1] Address delivered at the fourth annual congress of the Playground Association of America, June 9, 1910.

planation may be, Sunday is, as a matter of fact, for great numbers, if not for the majority of our children, a radiating center of evil tendencies for the entire week.

And that Sunday should have a demoralizing effect would seem to be the inevitable result of our present Sunday laws. If its influence were not in great measure an evil one, it would not be for the omission on our part of the sort of measure best calculated to make it so. We rightly prohibit work on Sunday so far as practicable. Our laws to that effect are essential to the existence of Sunday and constitute a most beneficent piece of legislation. But by forbidding play also, we have done our best to make the day, for our young people at least, a day of idleness; and the distinction between enjoining idleness and promoting evil is one hardly worth insisting on.

It is true that we do permit some forms of Sunday play. Reading, gossip, paying visits, are lawful, as are also riding, yachting, automobiling and aviation. Walking also is permitted; but so far as games suited to young people and not requiring an independent fortune are concerned, we make our prohibition fairly general.

It is true, also, that we foster and support the church; and going to church represents for many, even of our young people, a most valuable part of what Sunday means and ought to mean. But we cannot spend all the waking hours in church, even if the hours we spend there are all waking hours. When church is over, there is still a long day left to be filled up, and sedentary pursuits would never wholly fill it for the young. It would seem as though we had entered into a certain sort of partnership, more common during the Middle Ages than it is today,—our contribution being to find the idle hands while the party of the other part, a reputed expert in that line, agrees to do the rest.

You know what happens when you make a dam across a brook. It backs up on people's lawns and orchards, floods their cellars, carries off their apples and other movable possessions, tears their shrubs and flowers, and drowns their hens. In short, it trespasses generally on their property and their goodnature, to the detriment of both. Whose fault is it in that case that these depredations occur? Who is in reality the creator of such area of devastation? In the analogous case now under consideration we have hitherto blamed the brook. I think it is time that we traced the evil a little nearer home.

Our present Sunday laws are like that unwise sort of factory legislation which forbids children to work without requiring them to go to school; except that our Sunday legislation goes a step further in forbidding play as well. It thus holds the first place as an example of legislation enjoining idleness and producing crime.

What has got us into this position is the fact that our Sunday laws are a survival, a shell left on the seashore, from which the living creature has departed, the negative side of an institution that no longer lives. The Puritan Sunday law was a positive, not a negative, enactment. The Sunday it prescribed was not a day of idleness but of observance. Going to church was mandatory, and church was carried on for several hours twice during the day. It must have been a torture to the young people, but at least it occupied them instead of merely cutting off all natural occupation and, except for an hour in the morning, leaving nothing in its place. We retain the restrictions after the conception of the Sabbath for which they stood has been abandoned. The fortress has become a prison. What was once armor against Satan and his wiles survives as an incumbrance that delivers us more helpless into his hands. It is as though we went down to business each morning rigged out in the breast plate and buff coat of some Puritan ancestor, carrying a flintlock along with us by way of walking stick, merely because these accessories were once useful as protection against Indian attacks.

There is already evidence of a practical and increasing recognition of the true cause of Sunday lawlessness. In New York the park board has opened Central Park for tennis and baseball on Sunday

afternoons. Similar Sunday opportunities are furnished in Chicago and elsewhere. In Boston we have learned to permit certain kinds of sport such as swimming, skating and tobogganing (not all at the same time of year); but anything in which a ball is used is still anathema. I believe that such exceptions to our Sunday law will grow until our whole public provision in the matter of Sunday play has been radically modified, and that the sooner such a change is brought about the better will it be for us. Exactly what modification should be made is a matter that must be worked out by experience and that will always be dealt with somewhat differently in different communities. In general, I believe that all kinds of games and sports that are permissible at any time, including ball games, should be allowed on Sunday, under proper restrictions as to time, place and noise. I do not believe that such modification will take from Sunday any of the attributes that have endeavored it to us. On the contrary it is in the interest of Sunday, of its fuller realization, that we shall remove the fetters we have placed upon it.

But the great evil of our Sunday laws is not in the harm they do but in the good that they prevent. Their worst sin is against Sunday itself. Their revision is called for not merely because they have pushed poor human nature to the wall and forced it into lawbreaking in self-defence, but more especially because they have deprived this most beneficent institution of half its proper service to mankind.

What we need first of all to understand in looking at this question is that a day of idleness is not a day of rest. Our Sunday laws in prescribing idleness do not safeguard the Sabbath; they forbid its true observance. Rest for the young, for the healthy of any age, for anybody who is still in any sense alive, does not consist exclusively in lying down. What rests a man is not the attempt to stop the machinery of life, but the turning of the vital force into refreshing channels. The inevitably futile attempt to do nothing has the same effect on the human mechanism that is produced on a steamboat in a head sea when the screw comes out of water. The machine keeps on whirling just the same, only it racks the ship instead of sending her ahead. A boy will be more tired at the end of a day spent in idling about than after ten hours of some vigorous pursuit in the open air. We cannot too deeply take to heart the fact that for the human spirit loafing is not repose, but a source of fatigue and even of disease. Enforcement of Sunday idleness is, for a great proportion of the community at least, including all of the healthy young, the prohibition of Sunday rest.

And Sunday is not for rest alone. Its true service is a positive, not a negative one. It is not like the night, simply for sleep—a blank space between one working period and another. It is, on the contrary, a time set apart for the most important action of the week. It should be our fullest day and not our emptiest.

The churches have been right in this; and they have themselves supplied what is to most people an essential part of the re-creative experience for which Sunday stands. No Sunday legislation will be wise or adequate which fails to give them its protection and support. Church services should, for instance, be protected against the making of unnecessary noise in their neighborhood.

But Sunday is older than the church, and its purposes are wider than those that the church fulfills. The month and its division into weeks, if Darwin's hypothesis is correct, is older than man himself. Stamped in the physiology of all the mammals, and dating back to the time when the lives of our amphibious ancestors were governed by the period of the spring tides, the ancient sovereignty of the week seemingly justifies a generalization of Falstaff's sagacious boast, that we are ruled as the tide is by our noble and chaste mistress, the moon. At all events, whatever its physiological or historical foundation, the need of Sunday lies deep in human nature and would still be there even if there were no church; and it has other expressions than church going, important as that is.

There is, however, one other use of

Sunday, which is analogous to church going and usually a part of it; namely, recollection, in the sense of the Italian word *racogliamento,* the re-collection or re-assembling of the soul. In every stream there should be now and then a pool in which the hurry and the noise cease and we can see into the depths. Sunday is the day to allow the dust to settle and look around, to pull ourselves together, to observe our bearings on our more universal relations, note the variation of the compass, and lay out our course anew. Such a periodic re-assembling is necessary to the integrity and permanence of life, to the cumulative value of character. And for this purpose as well as for church going, wanton and unnecessary noise on the Sunday should be suppressed. Match games, for instance, at which crowds are permitted to assemble, should be relegated, so far as feasible, to the remoter portions of the town.

But not even for the spiritual advantages of Sunday quiet must sounds incidental to other uses of the day be too strictly suppressed. People must still be allowed to play the organ and to sing hymns, even though it disturbs your meditation, and the same is true of other profitable observances.

An essential use of Sunday is as family day. It is the day on which the father is at home, the day for playing the new piece on the piano, for singing hymns and songs, seeing the baby's new tooth and making the old man himself show what he can do in reading aloud, or any other stunts he thinks he knows. It is the day for going to the beach, for country excursions and trolley rides, for visiting museums and parks. I believe it should be a condition on violation of which the charter of any well-mounted museum or library should be forfeited, that it should be open on Sunday afternoons.

In this connection the permission of professional baseball and other public entertainments might logically be discussed. But these form a separate question and one apart from my present subject. In general my own belief is that professional entertainments, including baseball, involving as they do Sunday work, should be prohibited except where, as in the case of municipal concerts, they are incidental to the use of some park or other desirable place of public recreation and enhance its value.

But besides rest, religion and recreation—the three R's of sabbatarian observance—and its use as family day, Sunday fulfills another more essential service, a service which embodies, indeed, the aboriginal and inclusive purpose for the sake of which such an institution exists. Sunday is the day of compensation, the day of fulfillment of those essential purposes of life for which the weekday has left no room. It is the day for completing the pattern, for weaving into the texture of our lives those main strands of being which would otherwise be left out, and without which we are not quite alive.

A young man has spent the week bending over the columns of a ledger. A young woman has passed the working days standing at a machine making a few simple motions of the hand. The golden hours of strength and youth, the morning hours in which the vital current is at its height, which mould life and destiny in their image according to the use we make of them, have gone in such employments as these. Obviously some special provision must be made, some compensatory activity supplied, if life worthy of the name is to be preserved. The same is true of many lives of workers in our mills and factories. It is true to some extent of any life under the system of industrial specialization. For hardly any employment is so broad and catholic, so pervious to the motions of the human spirit, as wholly to convey the soul of any man.

It is true that perhaps the greatest good fortune of our modern world lies in the fact that we have outlived the notion that useful work can be degrading. But it is time we came to recognize the truth that lay behind that superstition. It should be at least a sobering thought that the great majority of us are living, and that our young people are growing

and taking form, under conditions that the vast majority of mankind have looked upon as involving a disgrace. Has a sentiment universally admitted until within a comparatively insignificant period of time been so devoid of truth as we now suppose? Is the Indian so wholly wrong when he refuses to surrender the free life of the plains to become the drudge of the factory and the dweller in a city tenement? Was the chivalric ideal of devotion to love and war so wholly mistaken that the life of a mill operative can be accepted as in all respects an advantageous substitute? Was the opinion of the ancient philosophers, that virtue and industrial occupation were incompatible, so far astray that we can accept industrial occupation of the narrower sort as morally sufficient in itself?

Specialization is a great industrial principle and a chief means of modern civilization. And specialization may be also a means of spiritual success where it enables a man to carry an art to the point of mastery, so concentrating his power that he may break through at some one point into a higher circle of expression and of life. But even in such a case, where specialization is in some art capable of being the vehicle of the human spirit, there is need of supplementary activity. No man is quite all singer, sculptor, scientist. Even in the case of these, some overflow, some supplementary activity, is necessary. There is some observance still due to that part of the bounteous human nature in them that even their art could not convey.

But specialization as we see it in our modern industry is not specialization upon an art nor according to the laws of art. It is not even specialization upon a service, upon a whole achievement of any sort. It is specialization within the task, carried often to so extreme a point, leaving to each worker so minute a contribution to the result, that nothing of significance is left. It is like the division of a fabric into pieces so small that neither form nor color is any longer visible. There is nothing left, either in the sort of activity or in its relation to results produced, that can become to any important degree a channel for the human soul.

A man, it is true, can so add up his column of figures that they shall become columns of strength and beauty in his life. He can so devote himself to any task as to make it an expression of moral worth. But he cannot through every task liberate the creative principle, utter the word that nature has intrusted to him. A man, if he has a hero's soul, can die heroically under any circumstances. But social conditions under which death and renunciation are the best opportunity offered cannot be considered a success. It is the business of society to offer to its members a way of life, not merely the liberty to die. As industrial civilization advances, and with it specialization becomes more extreme, the need of some other outlet, of some overflow for the part of human nature that industry leaves unexpressed, becomes intensified.

The truth behind the ancient feeling that menial labor is degrading, behind our instinct that the life of the factory drudge is not a life, is that man power is not like steam power a mere matter of foot tons. Man's strength does not consist of simple undifferentiated capacity for muscular contraction or nervous effort. It is, on the contrary, a power in great part prescribed, committed, billeted to certain ends. It exists only toward its predestined tasks and withers or ceases altogether except as it finds a way to these.

Man is the creature of certain kinds of acts and exists only as he embodies them—a fact that can be verified by anyone who will watch a growing child. There the process of his construction is laid before the eyes of whoever will take the trouble to observe. From the time when the baby finds his hands, wields his rattle or his spoon, you can trace the growth through achievement of the achieving animal, the self-creation of this creature who becomes himself through the doing of things that are to him significant. Through action are then visibly wound the main fibers of his being. You can see man the creator fashioning himself through the making of

block houses and mud pies; man the nurturer growing through the care of dolls and pets and plants; man the poet evolved in the rhythmic plays, man the scientist in plays of imitation, of collecting, dissecting, classifying; man the fighter wrought in the hundred games of contest, man the hunter in the chasing games, and man the citizen through team play.

There in children's play you can see going on before your eyes, in a series of acts clear and unmistakable, the process that makes man what he is. And the essential point to observe is that, through all his life, it is by obedience to these constituting activities which first created him that he keeps himself alive.

Man is the incarnation of his leading instincts—not primarily of the mere appetites or hungers, which control the subordinate, physiological manifestations of his being, but more wholly and pervasively by the great forthputting instincts, the creative, the assertive, the instincts of achievement. In the deepest sense he is these instincts. They are the ultimate fact about him, giving his true form and law, constituting the final and irreducible substance of which he is composed. His body is their tool. His mind and heart are emanations of them. Man is a process. His law is a law of action. Matter passes through him as through a wave in a rapid, and takes the shape which the law of his action gives it, as it obeys the laws of gravitation and momentum in the wave. He is not the material but the law, or rather the fulfillment of it, and exists as he embodies it.

In proportion as he is a maker, a fighter, a hunter, a nurturer, an investigator, a citizen, an artist—achievement set to rhythm—the man is really there. Uninformed by these constituent purposes he is a scarecrow, a derelict, the left-off clothes of a soul that has abdicated. These purposes create the man in the play and apprenticeship of his long infancy. In maturity their fulfillment still constitutes his life. When they cease to operate, the flame goes out.

That life is in these master instincts is a fact not opposed to or inconsistent with morality. Whatever the governing or selecting principle may be—an instinct of instincts, pure reason, conscience, oversoul, however it may be named, the bearer of ultimate authority enforced by the power of life and death—the master instincts constitute the substance with which this selecting principle has to deal. They form the realm of which volition is the king.

And obedience to the achieving instincts is never self-indulgence but always self-surrender. Their prescription states itself ever in the form of an extra-personal ideal, inexorable, independent of the subject's will. The true fighter, artist, nurturer, citizen, is such through subordination to an impersonal end, often to the sacrifice of life itself.

Man as his active nature has thus created him finds himself to a great extent a stranger in the modern world. It is no longer the world for which nature designed him, to which his great constituent instincts accurately relate. It is no longer a world of war and hunting, and it is for many of its people becoming a world in which even the building, creating instinct finds but a meager satisfaction. Man the hunter, the nurturer, the creator, finds himself set down for the best hours of his day, during all the working years of life to tasks so dessicated of all meaning, so barren of power to convey the expression of a human soul, that the soul is well-nigh starved out of him. That store of vital energy which should have gone to fighting him out a way of utterance has run to spiritual waste and left him dumb, imprisoned. This is the tragedy of civilization—that the end of all our labor and our sacrifice has been, for so many men and women, the defeat of that inner life which it was our whole object to preserve.

Mr. Roosevelt's insistence on the moral value of war and of the warlike virtues indicates a sound spiritual instinct. William James, in his search for peaceful substitutes for war, is a pioneer in a program of conservation of spiritual values that will before long constitute an essential feature in the policy of all pro-

gressive communities. But fighting is only one of the vital instincts left unfulfilled in modern industry. Civilization is largely the substitution of processes that effectively secure a living for more ancient ones which, though less efficient to that end, had the inestimable virtue that they also expressed a life. The cure is, in part, to re-charge these processes with the power of expression.

The deepest industrial problem of our time is not the problem of wages or even that of proper hygienic conditions, important as these are, but of so preparing the man for his employment, and modifying the employment to fit the man, that the process of gaining a livelihood shall no longer be, in so large a proportion of instances, a denial of the possibility of life itself.

Such is our weekday problem—as Ruskin so well saw and said—to find the artist in the artisan, to restore man the creator in the present slave to the making of useful things. Our Sunday problem is supplementary—to find room for that part of each man's life which his daily industry has shown itself unable to contain.

And this problem is not a hopeless one. If civilization has for a great proportion of mankind sterilized the working day, it has provided compensation in its enhancement of the possibilities of leisure. What it has taken from industry it has more than given back in art. Music, poetry and literature are more satisfying embodiments of life than nature ever gave. But for those who are denied participation in its leisure, whose loss in industry is not returned in art, civilization has been a loss almost unrelieved. It is to the opportunities of leisure as provided by a shorter working day, and above all to those afforded by Sunday, in which there is not merely leisure but strength and daylight and the morning hours, that civilized man must look for compensation. Sunday is the people's university, the day of liberal education, devoted to universal interests. It is the day for cultivating those things that belong to us not as industrial implements but as men.

I will return to the hills whence is my strength. Sunday is renewal, a rejoining of the primal sources of our life. In the island of Capri they have a pretty custom, a survival such as one finds in all South Italy of the Greek processional religion, in accordance with which the Madonna goes every spring for a week to revisit her former home down by the seashore where the church used to stand. There is an important symbolism in this old ceremony, and one in harmony with our present theme. Sunday is the day for revisiting the ancient shrines, for going back to the fountains of our strength, back in our racial past, for excursions to our ancient abode by stream and wood and seashore, for the revival of the joy of war, of the chase, and of intense membership as found in the great team games.

The true Sunday will be partly different for different men. Each to his natural habitat as Mother Nature calls. The artist condemned to office work will turn to his carving, the musician to his violin. The born teacher will spend his Sunday with the children—and all of us, I hope, are teachers to some extent. The Nimrod will to the woods, the poet to the hills, the soldier to some athletic contest. That which he should have been and is not in his daily work, each man will diligently seek on the day given him for this very purpose, that he should keep his soul alive.

The forbidding of such pious pilgrimage on that one day of the week consecrated by nature, and by the wiser portions of our law, to the end that such pilgrimage may be made, is not truly a Sunday law but a law to the effect that Sunday shall not exist.

Even those whose good fortune has placed them among the expressive trades, the lawyer, the doctor, the business man, require some avocation to keep them fully human and alive. To the clerk, the factory hand, whose weekday life is within the covers of a ledger or in the making of a simple muscular contraction—to these Sunday is their one chance of life, their day of standing erect, of resuming the form and stature of a man.

Sunday is the day of the lost talents,

of unfulfilled possibilities, the day for keeping alive some little fragment of the original gift that nature made. And this one day our Sunday laws take from us, or at least greatly impair.

For the young the need of Sunday is especially vital, the loss of it especially severe. The master instincts of our lives are not all equally present at all periods. Youth is the reign of some of those whose fulfillment cannot be packed into the narrow confines of a sedentary or meaningless occupation. Our industrial world differs most markedly from that of which nature is still dreaming in every growing boy and girl. The young man is still in his heart a viking, a soldier, a mighty hunter before the Lord. His soul is not fulfilled by adding figures or watching a machine.

And to the young especially the matter is one of life and death. Obedience to the great expressive instincts is during infancy, even up to the full age of twenty-one, a matter not merely of preserving life but of attaining it. With young people the question is not of survival merely but of whether they shall ever live at all. To our boys and girls from fourteen to twenty-one years old, of whom a large and increasing proportion of our factory population now consists, our Sunday laws are the denial of life, the permanent dwarfing, through starvation, of the growing soul.

The whole purpose of Sunday is a chance to grow and live. It is the one day consecrated and set aside, by nature and by man, to such fulfillment of our humanity as the necessities of our week-day labor cannot afford. When, on the top of long hours of sterilizing work, we impose this Sunday law to rob the mature worker and the growing youth of the one day in which nature might have had her part in them, to make them strong and beautiful and happy, we have sinned against nature and against the spirit of Sunday, the brightest and happiest of our institutions.

OUT OF THE DEPTHS

MARY BOYLE O'REILLY

The cold spring sunlight streaming through the great bare windows filled the interior of the prison chapel with light without warmth. From her high seat near the lecturn the commissioner studied the long lines of uniformed women on whose bowed heads and shoulders rested the intangible burden of shadowy bars. Women of every age were there, of many nations, each the central figure of a tragedy; but sitting thus in serried ranks, they looked more like one another than like their nearest relatives. Victims they were of weakness, victims of affection, victims—perhaps—of circumstances entirely beyond their control; face and figure and manner proclaimed the fore-ordained fate of each.

The service droned on: perfunctory platitudes on the one side; sullen indifference on the other. With sinking heart the commissioner searched every face for a look that responded. Dull, brute-like inertia she saw, cynical attention, hysteric absorption. The exercise seemed a parody of worship. At last the files rose for the benediction and above the rest, clean cut and straight as a pine tree, towered one foreign woman, an Italian contadina, her classic face set in lines of strong resistance. For her there was no service, no prayer of praise or pleading; nothing but rebellion bitter and impotent.

Presently the files were passing from the chapel. "How long has that conduct continued?" questioned the visiting commissioner. "Who is she? What is the offense?"

The warden, justly proud of knowing of her charges individually, answered at once:

"She is Vittoria Casabianca, committed on an indeterminate sentence, found

Footnote: By the statute law of Massachusetts the prisons of the state are in charge of the Board of Prison Commissioners (unsalaried, appointed for five year terms by the governor), of whom two must be women.

guilty of concealing a murderer; charged also with adultery against which she refused to plead. Her conduct record is good, but she has always behaved as you saw at prayers."

"The woman is under a cruel spiritual strain," commented the commissioner. "Arrange, please, that she is not forced to attend chapel. Give her, if you can, a chance to be of service. So she must find herself. Has she asked to see me? No? Then the rest may wait till her case comes up for probation."

Thus the matter rested.

* * * * * * *

The commissioner sat at her table studying the papers she must sign for good or for ill. As she wrote slowly, reflectively, fitful puffs of hot air rustled the loose sheets. Outside the pitiless sun beat down on the scorched earth holding all living things in the grip of the searing heat. In the prison corridor an advancing and a retreating footstep echoed insistently. Next moment a newcomer came through the office door with the swift, silent stride of a mountaineer, a prisoner in the prime of early womanhood, stalwart, nobly featured, a little gaunt and entirely rebellious.

"I am Vittoria Casabianca," she announced.

"Be seated," said the commissioner. "Shall we take up this record together?" The quiet voice held no echo of cant.

Silence. The newcomer's heavy brows frowned defiance, a flush of dull red showed in her olive-tinted cheeks. A moment the other woman waited patiently, then, "Vittoria, what is it that you want to say to me?"

Slowly, very slowly, the cameo face was lifted and the sensitive mouth became flexible.

"I call God to witness that I am a good woman."

"*Pazienza,*" said the commissioner frankly. "I have never doubted that you are a good woman. Tell me how this trouble began." An instant her understanding glance met the candid eyes searching her face, then fell to the paper on which her pen made idle traceries.

Again silence. One woman's eyes were fixed on the diagrams she was dotting, the other's on the toil-worn hands eloquently restless before her. Outside, in the sun-smitten world, birds twittered lazily in the languid trees, and the long drawn swish of scythes in the standing grass sounded soft, then sibilant. A breath of cooler air, edged with the promise of coming rain, filled the bare room with an illusive odor of pine woods and sea. Lost in memories the Italian woman stared through the long window. Her unseeing glance took no note of the prim little garden, for the eyes of her spirit were seeing, clear and true as the eyes of the spirit see always—a long sun-drenched reach of terraced vineyards purple and gold with grapes, great white oxen resting under the shade of mighty bronze oaks, gnarled old olives shimmering white in a cloudless Piedmont noon, and far off, beyond the swarming foothills, the dim grey Alps making a background full of peace.

"Begin at the beginning," urged the commissioner's quiet voice breaking the spell. The fine Piedmontese face was suddenly lined with pain.

"*Illustrissima*—It is a ver' long story—it is perhaps too long"; the unsteady voice entreated then—none interrupting—gathered courage. "*Illustrissima*, it is 'dis way: I was god-daughter of ma' uncle. We were poor in Italy—so poor—no gotta' black bread and onions for all. Ma' uncle in Boston he was rich—so rich—always two dolla' a day. I was eighteen. He sent money for me. While I sail on da' sea he die. *Sfortunata!* When I come by his house his wife—ma' aunt—being of Napoli—she open da' door a little—she say—'Oh! it's you—whatta' you wanta'? He is gone. 'Dere is notta' place here for you.' *Illustrissima*, I was alone. I was eighteen. A good woman, neighbor to us in the mountains, call me to her house, give me a bed, teach me to wear da' hat, get me a job on da' factory with her own girl. *Chè.* Never will I forget 'dat. . . . Then I married Giusseppe." The full throated voice grew husky.

"We had a home. Me tink 'dat some day—but it was notta' to be. Ma' husband he die. *Altro!* I go back to da' factory. I could not talk an' laugh like

'dose odder girls. They call me *'La Superba'*—the proud one. So I am da' best worker in da' factory; also, I keep ma' home—tree room—just like Giusseppe fix 'dem."

"Den com 'dat woman who was my friend crying and weeping. *Poverina!* Her son, Luigi, had knifed his man up by Worcester because of an infamy. It was a just quarrel, *Illustrissima*—a vendetta! But yes, da' man was dead. Luigi must fly to Italy. In two days would come a ship. His modder could not to hide him. So she came to me. *Santo Dio!* Was I to deny her? I?" The war-like spirit of Piedmont rang in the sonorous tones. "It was da' widow of ma' uncle that told the police—maladictions on her! So 'dey took me—but Luigi escaped!"

"But that other charge, Vittoria? Why did you not clear your name of the other charge?" Again the black brows scowled darkly.

"Eccellenza' for seven year I have live alone in this Amerika. . . Always I have turn my face odder way when I saw evil. . . . *'Non bisogna aver paura che dei nostri peccati.* ('No need to fear any but our own sins.') . . . And 'dis shame was trust upon me!"

"Vittoria," said the commissioner quietly, "I think I understand; at least I am going to release you on probation; and when you go back to the old home, back to the factory, I want you to begin again to go to church."

The soul that had tested the bitter gamut of pain looked out of the velvety eyes. The prisoner's attitude acquired a maiden-life aloofness.

"It is impossible. . . . I kiss my hand up to you *Eccellenza.* . . . It is 'dat the Eccellenza does not understand. . . . Always since a child I have done ma best. Always I have gone to church. . . . Always I have prayed. But never have I been unreasonable with God. . . . Never have I asked Him for whatta' I should not have had. And this shame has come to me. Eccellenza, I pray no more."

"Adagio, adagio!" said the commissioner gently. "I did not ask you to pray. Only I require that you go regularly to church—into the church, you understand. But while you do not pray, to prevent your life becoming bitter and hollow, you must render service to some one in need. When you find and choose your service come and tell me. *Addio."*

* * * * * * *

A fortnight of freedom passed with no sign from Vittoria. She had gone back to the familiar neighborhood, taken up the old burden with the shadow of the prison about her, and a barrier almost tangible shut her out from the world she knew. How cruel the utter loneliness had proved showed in her set face when the commissioner sent for her.

"Vittoria," she said, ignoring the obvious. "I have here a practically dying baby who must be carried to the state hospital. Tomorrow is Saturday, Monday is a holiday: Can you find time to do me this service? See what neglect will do!" The wee, wailing thing lay restless and grimacing with pain, its tiny hands grasping the vacant air. Above it the childless widow bent anxiously.

"Ah! *poverino!"* murmured the liquid voice. *"Mio diletto!* too early you learn that love is more than food! *Si! Si! Eccellenza,* I will taka' de *bambino.* To 'de state hospital, you say? Surely, yes." Her strong arms cradled the whimpering babe into comfort; the smile in her eyes touched her unsteady lips. And the two were gone.

On a golden day in harvest time Vittoria returned, a little shame-faced and rigid, but her brave, true self withal.

"*Signora,*" she announced, "It is of 'dat service I would speak. You were right, truly right. I was wrong. So I have found a service because I was wrong. 'Dat is, if 'de *signora* permits. *Altro!* Does 'de *signora* know North street, down by the ships, 'dat is in the night? *Si?* De *signora* must 'scusa' if I say 'dat I am notta yet so old and bad looking I can go alone on 'dat North street at night. But I have a friend 'dat is as one hag—and witha' her it is safe 'dat I go. So if it is permitted for ma' service, I will go down 'dat vera' bad street till I see a girl walk alone, and to her I will say, 'Behold! I am a good woman; de policeman will say yes. I

want you to come home and sleep in my odder bed. It is ma' service to ask you. 'Dis will I do if it is permitted."

"It is permitted," answered the other woman. "Vittoria, I am proud of you."

The splendid service was a month old when Vittoria brought her work card to the office, and she, whose one pride lay in her industry, pointed with an easy laugh to the diminishing total for piece work.

"Once," she explained, "me tink always how much I can make . . . how fast ma' machine will go. Now it is different. Never I make mistake . . . never I spoil the work . . . always ma' fingers tink for me. But now I work notta' so fast because always I tink of the night, and 'dose girls I will find, and what I must say so 'de will come with me. But yes, it is a service."

The listener smiled her comment. There was nothing to be said.

Three days later Vittoria was in the office, eager, anxious, voluble with excitement.

"*Madona Mia*," she cried, all unconscious of the caressing term. "It was last night two days. In da' dark I saw a girl frightened, crying. Ma' heart say to me, 'Dat is a good girl.' Quickly I go to her. 'Den I say, 'Come by 'dis lamp—look at me! See, I am a good woman! Now come home and sleep in my odder bed. 'Dat is the will of the commissioner. Also it is ma' service. Come!" But no, she run from me, down on da' wharf. 'Dere it is all dark. 'Den I run too. Close by is da' water black and cold. 'Den I am afraid for 'dat girl she look wild. *Che!* I hold her tight and my heart cry out '*Madre Mia*, pray for me 'dat she do not fall into 'dat water.' Soon da' poor child come wid' me quiet enough. When she see' ma' little stove and ma' new lamp ah! 'den she cry! All night in her sleep she makes a moan. It comes morning when I call her. 'Den I tell her: 'But yes, see your clothes all dry and clean. Now eat some *polenta*, hot. Perhaps you have notta' home at all. So you can stay wid' me till you earn some money. 'Dis morning we go to ma' factory. 'De boss will give you a job because I ask it—I, Vittoria. Tonight we will come home to sleep. But I want you to know 'dat I understand why you ran down on 'dat wharf. Also I cannot watch you. I have ma' money to earn and ma' rent to pay. Child, you must watch yourself! *Altro!* tonight, before we go to sleep, I am going to take you to church. Afterwards you must choose a service. Then there will be two of us. Once I was wrong, but now I know. That is the only way.'"

THE AUSTRALIAN JOURNEY OF THE COLUMBIA PARK BOYS' CLUB

SIDNEY S. PEIXOTTO

In May, 1908, a committee of Australian men living in San Francisco waited upon me to discuss a possible visit of forty Australian boys to the United States on their way to England. They were to represent the Young Australia League, a Western Australia boys organization for the promotion of patriotism and the creation of a love for their national game, football. The committee asked the co-operation of the Columbia Park Boys' Club in forming a team to learn this unique and unknown outdoor game. The members offered their services as coaches. Later they were deeply impressed with the way in which our athletes took hold of the game and wrote enthusiastically to the officials in West Australia of the progress we were making. They further suggested that when the Australian boys' tour had ended, a return visit be proposed from the Columbia Park Boys of San Francisco. The Australian boys' trip did not take place. The large amount of money needed to carry out the enterprise could not be obtained and the boys had no means of producing an income. When it was

finally decided to abandon the Australian boys' trip, a hearty invitation was extended by the officials of the Young Australia League for the boys of the Columbia Park Boys' Club to make a tour under their auspices. The invitation promised that a month and a half's accommodations in the homes of Australian people would be assured during the West Australia part of the trip, and that upon my acceptance every effort would be made to secure the same promise in the other states of Australia. In January, 1909, I cabled an acceptance.

I decided to take a veteran party of boy members of the Columbia Park Boys' Club, composed almost entirely of those who had for many years made the summer walking trips through California. These boys composed a good band able to give two evening performances with entire change of musical program, including all phases of choral singing. They were pre-eminent in every form of athletics and singularly well developed as a result of years of gymnasium training and outdoor life. I had such confidence in their ability and good behavior and in my control of them, that I was certain we could make as great a success in a foreign country as we had achieved in our own state.

After months of preparation, we left San Francisco on the Steamer Mariposa on May 21, 1909. There were thirty-nine members of the club, Mr. Loy, our secretary and an accomplished pianist; Katharine Angelo, well known as a charity worker in San Francisco, who was to be matron to the boys, and Garnet Holme, famous as a dramatic coach in the University of California, who preceded the party one month as advance agent.

Our first stop was at the beautiful Island of Tahiti where we gave four performances to excellent audiences. Two days after leaving Tahiti we came to the quaint town of Raratonga on one of the Tonga Islands. On June 16 we arrived in Wellington, New Zealand, and from there traveled through the North Island by rail to Auckland, where we spent three days. We were received with great heartiness by everybody in the various towns. We left Auckland and arrived on July 2, after a five days' trip, in Sidney where a most cordial welcome awaited us. We were quartered in the Victoria Barracks as guests of the New South Wales government. We stayed twelve days in Sydney and then journeyed to Melbourne, stopping at six large towns on the way. After a ten days' stay in Melbourne, including a visit to the Victorian mining towns of Ballarat, Bendigo and Geelong, we took steamer for a seven days' trip to Perth, West Australia, where Jack Simons, the man responsible for our trip, lived, and the welcome was unbounded. We stayed in West Australia six weeks, visiting eighteen towns and going as far as the gold mines at Kalgoorlie, five hundred miles from Perth, in the midst of an Australian desert. We left Australia on October 2 and after five days' steamer travel came to Adelaide; a ten days' stay in Adelaide and we began a three weeks' tour of South Australia, continuing on to the silver mining town of Broken Hill, three hundred miles from Adelaide, and then through the mining, sheep raising and agricultural districts of this prosperous state. From Adelaide we went to Melbourne, stopping at eight large centers on the way. From Melbourne we took a steamer to Tasmania, visiting Hobart and Launceston, the two large cities of this state, and made a two weeks' tour along the northwest coast to Burnie, where we took the steamer back to Melbourne. The party stayed one week in Melbourne and then returned to Sydney, where it stayed twelve days. This ended the great tour of over 10,000 miles through Australasia. We took the steamer "Makura" on the seventeenth of January, 1910; stopped one day at Brisbane and three days at the Fiji Islands on the way to Honolulu, where we had the misfortune to be quarantined for two weeks on account of sickness aboard the steamer. After being released we spent six days in the city of Honolulu. We arrived home March 1, 1910, having been away on a successful trip just nine months and one week from the time we started.

During this long tour the boys of the

party gave 162 evening entertainments, twenty-four open air band concerts and twelve sport evenings in the open air. In athletics the boys played thirty-eight Australian rules football games, winning twenty-seven; twenty baseball games, winning eighteen, and five basketball games, winning all. Besides this the boys gave forty exhibition baseball games between two nines composed of members of the party, and twenty-two exhibition basketball games. They shot twelve rifle matches with crack cadet teams of Australia, and took part in a number of swimming and other athletic field days. Every night, before the performance, the band paraded the streets, and one can see the boys were busy every moment of the day, from the time they arose to the time they went to bed at eleven o'clock in the evening.

It was a vigorous, delightful and hard-working trip. The continuous travel by rail, making early trains, and the active life in the open air caused such a healthy spirit that not one of the boys on the whole trip had any taint of sickness. They enjoyed magnificent health every day they were out, although they landed in Australia in the middle of winter and left in January, when the very hot summer was at its height.

The cost of the trip is estimated at $28,000 of which the boys earned $23,000 through their entertainments and games —truly a wonderful showing. The trip would undoubtedly have paid all expenses had it been understood in the early days of our Australian visit, but there was a doubt in the minds of the Sydney and Melbourne football people as to the ability of our boys to play their game, and our early ventures were unprofitable. Through co-operating with local institutions, the party gave $4,000 to charity.

The boys were received everywhere with marked favor and good will. Throughout the seven months we spent in Australia, we were quartered, in every city and town, in the homes of the people. We left behind a love and good will that we believe will last forever. The boys' intelligence appealed to the Australian people and it can be said with truth that they have raised Australian conceptions of the merits of American boyhood.

In the seven states visited, over one hundred dinners and functions were arranged in our honor. In Sydney a brilliant outdoor reception was planned on the beautiful domain, at which Lord Chelmsford, governor of New South Wales, and Lady Chelmsford presented the party with a state flag. In Melbourne the flag of the Commonwealth of Australia was presented by the premier, the Hon. Alfred Deakin. In West Australia Sir Gerald Strickland and Lady Strickland presented a beautiful silk flag made by the girls of the Technical School in Perth. In Adelaide a state flag was presented by Sir Day Hort Bosanquet and Lady Bosanquet. At Hobart Sir Edward Barron and Lady Barron presented the party with a flag of Tasmania. At Brisbane Sir William MacGregor and Lady MacGregor presented the boys with a flag of Queensland. At Fiji the party was presented with a flag of the principality by Sir Everard Im Thurm, and in Honolulu Governor Frear presented the state flag of Hawaii in the throne room of the old king's palace. Besides these men, representing the king of England, the premiers of every state and the mayors of every city took occasion to say a fervent word of welcome to the visiting party.

This tour, historic in boys' work and education, will be the means of giving others the great privilege of travel. In September, 1911, a party of West Australia boys, headed by J. J. Simons, is to land in San Francisco and make a tour of the coast under the auspices of the Columbia Park Boys' Club. It is to be hoped that their journey will be extended to other states. They are coming prepared, as we were, with a band of music, theatrical performances and ball teams.

One of the greatest results of the trip has been the introduction of baseball among the boys of Australia. It has been played for many years in Australia by men who are cricketers in summer, but now for the first time the Australian school boys have taken up the game. In four months from the time of our departure from Melbourne to the time of

our arrival, eighteen boys' baseball teams had been formed in the public schools, and they were then playing an earnest competitive tournament for the championship of Melbourne. The same story was told us in Sydney. The boys were deeply interested in America's national game, and from later advices it can be stated that it has been placed on the Australian Boys' athletic calendar and promises to be popular.

The trip had a deep meaning to the members of the party. Every boy profited in many ways from the influences of such an outing. Not only were they all ruddy and healthy, each with ten pounds increased weight, but in mind and deportment the trip had positive results. The lessons of the trip have been valuable to the Columbia Park Boys' Club and we stand pledged to continue this idea, as contributing to its leadership in work with city boys.

SOME FACTS CONCERNING CERTAIN UNDERNOURISHED CHILDREN[1]

FRANCES PERKINS

No one today denies that in every large city in the United States there are many school children who are habitually undernourished, nor does any thinking person deny that this malnutrition results in susceptibility to disease, in inability to study, and in general inefficiency.

The question discussed at present is how to prevent malnutrition and relieve a situation which is felt to be intolerable, but the causes of which are so closely bound up with a variety of social ills that it is difficult to separate them distinctly. While a case of malnutrition is obvious to a physician, the elements in the daily life of the child which contribute to bring about this state are seldom well understood. The study here presented was made in an attempt to understand the family and social circumstances of a definite though small number of children who were obviously the victims of malnutrition.

The opportunity to make such an investigation arose in connection with an experiment in feeding undernourished children, conducted by the School Lunch Committee in February, 1910. The selection of the 107 children who were the subjects of this study was made by a Board of Health physician in a public school on the upper West Side of New York city. The doctor examined all the children in the four lower grades and selected those who were evidently suffering from malnutrition. The 107 cases so selected were thirteen per cent of all the children in those grades.

The committee offered these children free tickets for the regular school lunch for a period of three months, in the hope of testing the value of that luncheon and also in an attempt to build up the children. To carry out the experiment it was necessary to visit their homes and to obtain the consent and co-operation of the parents. Two or three visits were paid to each family and every effort was made to check up and verify the facts thus learned. Out of such conversations a wealth of material was accumulated—much of it meaningless when reduced to statistical form or by its nature irreducible to such form. The sight of many little children with the blight of hunger set upon their future, has made it impossible for the investigator and writer to forget that the material here treated in a cold, impersonal manner, is nevertheless a mass of human documents full of human misery. Such an investigation would be inexcusable unless its ultimate purpose were the lessening of the volume and intensity of that misery. The study is numerically small and the facts brought out must be taken simply as illustrative and suggestive material.

[1] This article is the report of a study made in the Bureau of Social Research of the New York School of Philanthropy.

PHYSICAL CONDITION

The first records examined were those relating to the physical condition of the children. The school doctor had examined them carefully and noted such defects as:

Defective teeth in 79 cases, 74 per cent.
Defective nasal breathing in 49 cases, 46 per cent.
Hypertrophied tonsils in 38 cases, 35 per cent.
Defective vision in 57 cases, 53 per cent.

In eight cases there was no doctor's record, but of all the others only one is recorded as having no physical defects, and sixty-nine have two or more of the above-mentioned defects.

Poor teeth are the commonest physical defect recorded. The great predominance of such non-nutritive foods as coffee or tea and bread in the diet of most of these children, and the almost universal habit of soaking the bread until it is soft, can hardly have failed to have some deteriorating effect on the teeth. Dental experts, too, agree that where the teeth become bad, whether from lack of care or lack of proper food, they are likely to bring about all sorts of digestive disorders. Thus, while defective teeth serve to aggravate malnutrition already established, it is equally true that undernourishment may have been the cause of the poor teeth.

Defective nasal breathing, of course, means adenoids. If the active cells which compose these glands in the nasal passages are not supplied with sufficient carbon, oxygen, hydrogen, and nitrogen, they are unable to perform their secretive functions and, the cells being inactive, the glands gradually dry up and harden. Thus malnutrition may be the direct cause of adenoids, and the defective breathing caused by adenoids may greatly intensify the symptoms of malnutrition.

Hypertrophied tonsils, from which thirty-five per cent of the children suffered, are again hardened glands, and malnutrition may cause this condition and may be aggravated by it as in adenoids.

The three cases of weak lungs, while having no statistical value, are nevertheless illustrative of the doom hanging over some of these little children. They are peculiarly striking when it is recognized that all three of these children come from families classed as very poor —$85, $130, and $156 for each person yearly being their economic standing. One is a crippled boy (tuberculosis of the spine) in a family where two other children have tuberculosis of the bone and where seven children have died in infancy. The mother, a widow, earns about $300 a year, and on this attempts to support her family of five children. It is manifestly impossible to do this on any decent standard, and the result is that they dwell in three rooms, one of which is dark, and live mostly on bread and tea. One or two meals, rather than three, of even this poor diet is a frequent occurrence.

The second child is from a Russian-Jewish home, also very poor, with an income of $130 a year for each person. A working mother and a very poor diet, where coffee and bread regularly form two meals and where the third consists of soup or stew, add to the tragedy of a boy who already has weak lungs.

The third is an Italian boy with a continual pain in his chest and a bad cough which has lasted for two years. The father is a cobbler making $7 or $8 a week, and the family live in the basement rooms back of the shop. The lad with the pain in his chest sleeps in a semi-dark, damp room, and eats little besides macaroni, bread and coffee. One further element of hopelessness is that he has turned fourteen, has taken his working papers, and must get a factory job at once.

THE FAMILIES

The families from which these undernourished children came proved to be typical of the neighborhood and of the school population there. They are mostly Irish, German, or American by birth or recent descent. In many cases both father and mother were born in New York city and educated in the public schools. As a whole the families were intelligent and self-reliant. Only five families had ever asked for aid from the

Charity Organization Society or the Association for Improving the Condition of the Poor, and in only five were there cases of marked intemperance.

For the most part the size of the families was normal:

47 families had 1, 2 or 3 children each.
50 families had 4 or 5 children.
8 families had 6 or 7 children.
2 families had 8 or more children.

THE HOME

The tenements of this district do not offer desirable homes to families of any income—old-law tenements, either the railroad type or the type which has small, glass-covered airshafts being the rule. This makes a very large number of dark and semi-dark rooms in all the houses, and it is difficult to find a flat where all the rooms are adequately ventilated. Sashes cut through into other rooms do not provide sufficient light and air for sleeping or living rooms. Only twenty-four families in this study appear to have escaped the undesirable dark rooms. Thirty children came from homes where one-half or more of the rooms in the apartment were dark and fifty from homes where one-third or more were dark.

Sleeping in dark, ill-ventilated rooms, as so many of these children do, can but add to their mal-nutrition, as the normal supply of oxygen from the air is cut off.

Overcrowding is by no means as characteristic of this neighborhood as of some tenement districts of New York. According to the standard of two or more persons to a room, thirty-three of these children were living under overcrowded conditions, while the border line cases of five people to three rooms, seven people to four rooms, etc., often represent quite as undesirable situations.

ECONOMIC STATUS

Malnutrition is so obviously connected with poverty that an attempt was made to classify the children on some basis which should make clear the number who were actually in poverty. Prof. Robert C. Chapin, in his Standard of Living in New York City,[1] says $900 for a family of five—two adults and three children—probably permits the maintenance of a normal standard so far as the physical man is concerned. "On this the family can keep body and soul together and meet the most urgent demands of decency." Any sum below this, Professor Chapin thinks, is not sufficient to maintain such a standard. This standard has been taken as the basis for the "poverty line" drawn in this tabulation.

Nine hundred dollars for a family of five is equal to $257 per adult person per year. The total income of each family in this study was compared with the number of persons dependent on that income. These include all members of the economic family—parents, dependent children, wage-earning children and dependent relatives. Two children under working age were considered as equal to one adult person in the distribution of income, and the total income of each family was divided by the number of adult persons so determined. The cases were then arranged in order of their incomes per person and the poverty line drawn at $257 a year for each person. Seventy-four cases, sixty-nine per cent, fell below this poverty line.

All sorts of trades and callings were represented among the workers in these families, and the wages received seemed to be at the accepted rate. Irregularity of work and so of income added to the distress in many cases. Except for the six widows' families and one or two where the head of the family appeared to be peculiarly shiftless, there seemed to be no special reason for the evident lack of income. It is a plain illustration of a situation where current wages are below the living standard.

In order to analyze the wages question a little more closely, the wages of heads of families were classified apart from the total family income, which included wages of children, and other items. The wage of the head of the family is the only permanent asset upon which a family can reckon. The wages of children add to the total income for only a few years between the time when they become of working age and the time when they marry and leave home. Thus, a family in comfortable circumstances to-

[1] The Standard of Living Among Workingmen's Families in New York City. By Robert Coit Chapin. Published by Charities Publication Committee, 105 East 22d street, New York, for the Russell Sage Foundation. Price postpaid $2.

day may have had a period of real poverty in the past—an influence which must be considered in accounting for the present malnutrition of the children in question.

Only fifteen heads of families earned $900 or more a year, while seventeen earned under $500 a year. Barely fifteen, then, of the fathers of the children here studied were in receipt of wages sufficient to support a normal family of three children on a normal standard.

It is evident that poverty and the fear of poverty have not been far from the lives of these undernourished children.

DIET

Information was gathered in regard to the home diet of these children, but any criticism of that diet must be made from a layman's viewpoint. Bread and coffee or tea for a growing child's daily breakfast are, even to the layman, an evidence of lack of proper food, and in eighty-one cases (seventy-five per cent) this is the regulation morning meal. In thirty cases (twenty-eight per cent) two meals a day—breakfast and supper—consist of this almost non-nutritive but bulky food. Four cases are reported as habitually going without one meal a day, usually breakfast.

Proper and sufficient food is the essential thing in preventing or curing malnutrition, and poor and insufficient food is quite as influential in causing it. Even this brief statement makes clear the fact that the family diet provided for these children is far from desirable.

CONTRIBUTING CIRCUMSTANCES

In reviewing the entire study, the writer attempted in each case to sum up the circumstances present in the life of that child which might contribute to bringing about the malnutrition. Few cases of malnutrition in any group can be laid with certainty at the door of one cause. Underfeeding is the one obvious explanation, and when sixty-nine per cent of the cases studied are shown to be in poverty, it is a thoroughly justifiable conclusion that a large part can be accounted for by this one thing—underfeeding. Other circumstances, however, mostly concomitants of poverty, appear in almost every case, and it is the presence of these elements which contribute to the poorly nourished condition that makes it necessary to qualify the statement that underfeeding, even among the poor, is the sole cause of malnutrition.

The close connection already pointed out between undernourishment and physical defects makes it difficult to decide whether physical disability is cause or result. The writer strongly inclines to the opinion—and in this she is supported by good medical authority—that it is most often a result of malnutrition. Once established, however, the physical weaknesses tend to increase the malnutrition, and for that reason they have been noted here as elements possibly contributing to malnutrition.

The circumstances most often found as contributing to malnutrition are grouped in the following table for the purpose of giving them their full value as causes:

Inadequate food in	84 cases
Overcrowding in	33 "
Sleeping in dark room in	30 "
Working mother in	16 "
Past poverty and underfeeding in	4 "
Physical disability in	45 "
Lack of exercise in	2 "
Smoking cigarettes in	2 "

SUMMARY

This study, because of the small number of cases included, has served chiefly to bring out suggestions which may be summarized as follows:

1. Physical disabilities of one kind and another are closely associated with malnutrition, and make it doubly dangerous.
2. In many cases the money spent on food is not spent to the best advantage from the point of view of nutritive value, and this is chiefly due to ignorance.
3. Actual underfeeding due to lack of income is the chief cause of malnutrition.
4. To the low wages paid to workingmen may be attributed the real reason for the underfeeding of children which so seriously menaces the vitality of the next generation.

Poverty undoubtedly comes first as a cause of the underfeeding so often indicated by this study, but ignorance is a close second. In fact, ignorance, discouragement and eternal weariness are but part of the wider heritage of poverty, and the rôle which these elements

play in bringing about the underfed child can hardly be overstated. The difficulties of tenement housekeeping, with no closets, no store rooms, no time and little money, make it likely that poor food will long prevail under such conditions. Undernourished children, too vitiated ever to rise out of poverty, are bound to result unless some constructive program hinders.

Perhaps we shall adopt the public feeding of school children as a temporary expedient to head off further degeneration due to underfeeding. If consistently carried out on an educational basis this plan has many desirable elements.

Perhaps we shall come to realize that malnutrition exists in all classes of society, and is often due as much to unwise feeding as to underfeeding. We may sooner or later agree that even private housekeeping is a social and community matter. Perhaps we shall see food prepared by public co-operative kitchens at great economy and in accordance with a scientific diet. The great difficulty of good housekeeping under modern city conditions, and especially among the poor, makes this seem a possibility. The writer believes that until the private frying-pan and its pernicious contents are abolished we shall have malnutrition.

Whatever measures of relief are discussed, it must always be remembered that an underfed child in school means an underfed family at home, a family with a standard of living below that which is socially desirable. This is a situation which no mere bowl of soup doled out to the child at school luncheon on five days in the week for ten months in the year is going to correct. It is also true that the cause of this poverty situation lies too deep to be permanently relieved by even the best organized charitable assistance. School-feeding and charitable relief for the family may both be used to advantage as temporary palliatives for an intolerable situation. The questions involved in preventing malnutrition are after all the two which are fundamental to all social reform—the question of increasing the rate of wages and the question of making education more widespread and more scientific. Temporary relief is necessary, and its method may well deserve discussion, but it is after all only an expedient to head off malnutrition until society adjusts itself and provides adequate incomes and adequate education to all its workers. The heading off must be done, however, and done at once, if we would preserve health and strength as the heritage of the nation.

INDUSTRIAL SURVEY OF THE MONTH

GRAHAM TAYLOR

DR. HOLMES FOR THE MINES BUREAU

The mining industry has been the center of social interest during the summer. The creation of the new Bureau of Mines by Congress indicates the growing public interest in the conservation of both the coal deposit and the lives and welfare of the increasing multitude of men engaged in mining, as well as of the greater multitude of women and children depending upon their efficiency and safety. The bureau is charged with investigating the industry in order to prevent waste of life and to improve the methods of mining. This function hitherto has been partly fulfilled by the technologic branch of the United States Geological Survey. The Bureau of Mines is placed under the Interior Department, and its work is strictly specialized. It not only will unify and increase the number and efficiency of the federal mine stations, but will promote the establishment of and the co-operation with the state mine rescue stations.

Scarcely less important than the creation of the Bureau of Mines is the appointment of its first director. Its absorption of this work of the Geological Survey, for mines and miners, naturally

suggested Dr. Joseph A. Holmes, the expert in charge of the latter, as the best appointee for the new position. His nomination was still further suggested by his widely recognized scientific equipment, his long and varied experience, and his marked success in the conduct of that exacting work. The unanimity with which the coal operators and miners throughout the country urged his appointment, made the opposition of certain government officials appear both unseemly and suspicious. It is said to have been due to Dr. Holmes's avowed allegiance to the progressive conservation policy, with the personal controversy concerning which, however, he was not involved. President Taft's independence in appointing him, notwithstanding this opposition from those in high place, is to be appreciatively commended.

After graduating from Cornell University in 1881, where he made a special study of the chemistry of explosives and metallurgy, Dr. Holmes visited the mining regions of this country and Europe, observing especially the efforts to prevent loss of life and waste of resources. He was for ten ears professor of geology in the University of North Carolina, and later served as state geologist. Under the federal government he has studied the fuel value of coal fields, and his investigations of mine explosions lay the basis for the main work of the newly created Bureau of Mines. In company with prominent mining engineers from foreign countries, whose service was secured by President Roosevelt, he visited our important coal fields to learn what foreign safety practices might be introduced into this country. The three state mine rescue stations in Illinois and the twelve government stations—one in each of the larger mining states of the country—were planned by Dr. Holmes. His work has won the entire confidence of mine owners, miners and mining engineers.

Dr. Holmes's general policy as director of the Bureau of Mines could not be expressed more favorably to all the interests involved, than in his paper on The Prevention of Coal Mine Accidents before the National Civic Federation in New York city on the twenty-third of last November.[1]

His consideration for the men who invest their capital and those who risk their lives in the industry was well expressed in these words: "It is unjust and irrational that in this great and essential branch of industry, reasonable profit should be dependent upon any unnecessary sacrifice of human life, and unnecessary waste of resources which we can neither replace nor restore, and which will be essential to the future development of the country." His appeal to the public to deal fairly with both operators and miners should burn its way into the heart and conscience of the consumers of coal and our lawmakers: "This industry needs and deserves fair treatment at the hands of the American people, and upon its receipt of such treatment, depends in no small degree not only the welfare of the operator, but also of the 700,000 miners who risk their lives in supplying the fuel for the nation's industry, and the heat and light for the nation's comfort and convenience." The ring of high purpose in these utterances of Dr. Holmes himself goes far toward warranting the endorsement of a veteran United States senator, who said that in all his public life he could not remember anyone mentioned for office who had back of him such overwhelming testimony in favor of his fitness, as has been forthcoming in this case.

FIRST MINE RESCUE BUILDING

Happily, almost simultaneously with the appointment of Dr. Holmes, comes the announcement from Springfield, Ill., that work has been begun on the building for one of the three rescue stations established by the act of the last Legislature. This act was drafted and presented by the State Mining Investigating Commission on which Dr. Holmes has rendered very effective service, especially in drafting this bill as well as the one providing for protection against fire in mines. These three stations are to be installed and maintained at central points

[1]Quoted by THE SURVEY, January 29, 1910, in an article on An Epoch in American Mining, p. 575.

in the northern, central and southern mining districts of the state. They are to be equipped and manned for fire fighting and rescue work in coal mines, and to be in charge of men thoroughly trained to meet the extremely dangerous situations which suddenly confront both the victims and the rescuers in mining disasters. These men will not only know how to use scientific rescue appliances, such as oxygen helmets, but will train in the work of prevention, self-preservation and rescue, miners who will be sent to them in groups of ten or twenty at a time, to be kept at practice from a few days to a few weeks. In times of disaster these trained miners are expected to constitute a volunteer rescue corps, who will be willing and ready to use the knowledge they have received at the stations to save life and property. As at Cherry, the expert, disciplined and trained heads of these stations will naturally be called upon to lead the rescuers.

The station for the central district in Illinois at Springfield will be equipped with the first building of its kind in the United States. Its site, 180 by 250 feet, was selected by the special mine rescue station commission, and was presented to the state through the efforts of the Springfield Chamber of Commerce.

ILLINOIS COAL MINERS' STRIKE

Since the period of the trade agreement between the Illinois coal operators and the United Mine Workers of Illinois expired April 1, coal mining has been practically suspended in this state. Only the independent operators and some deserters from the association, whose mines produce by far the smaller portion of the product, have mined any coal. Over 72,000 miners have been idle through most of these six months, and 45,000 of them have been without work and wages all that time.

The struggle, which closed last month with a settlement more satisfactory to the miners than to the operators, has been remarkable on many accounts. It presents some phases of much general interest, aside from many more technical points of special interest only to the trade. In the background of the whole conflict is to be clearly recognized the unusually close relations long subsisting between the operators and the miners. The leaders of each are wont to call one another by their first names, and there are many evidences of personal friendship across the lines. For years, moreover, there has been very substantial agreement between the operators' association and the miners' union on the policies underlying their trade agreements. The operators depended upon dealing with fully organized men under a trade agreement, as surely as the men did.

BEARING ON CLOSED-SHOP ISSUE

Even the "closed-shop" apparently has been preferred by them, and has been urged upon the miners not only to protect the operators' association from competition with the independent mine owners, but to protect the better conditions of the Illinois miners from competitors in other states who have never conceded to their miners as favorable terms. When the suspension of work took place, however, it is to be noted that the miners' union did not respond to the appeal for the all around closed shop, much less contend for it. This goes to confirm the opinion of some of the closest and most unbiased observers of industrial conflicts, that the closed shop issue does not so much involve an invariable abstract principle as a very variable question of expediency. Under some circumstances it seems to the interest of both parties to have closed shops on both sides. Sometimes it is recognized by organized employers to be to their own advantage to deal only with organized employes. More constantly, though not always, the closed shop is considered essential to the existence of organized labor. But seldom are the unions willing to agree to work only for an employers' closed shop organization. The issue, therefore, is likely to settle itself on both sides according to expediency involving concrete points of advantage, rather than by any general declaration of a universally applicable principle, such as each side is accustomed to affirm in convention resolutions.

GRIEVANCE OF THE MINERS

There were two very irritating positions early in the struggle, taken by each side. The miners began to be irritated when the operators refused to bear the cost of the "shot-firing." The blasts were formerly fired by each miner for his own work. On account of many accidents due to the firing by inexperienced or careless men, the miners secured the passage of an act by the Legislature, requiring all shots involving the use of more than two pounds of powder to be fired by experienced shot firers, for whose pay the law held the operators responsible. But when the next trade agreement came to be made, the operators contended that the shot-firing is as much the miners' work as the digging of coal. They therefore insisted upon charging this expense back to the miners by reducing the wage scale. To this the miners submitted under protest. Their demand for an increase of five and a half per cent in wages is in part to cover this charge. But the miners insist that the shot-firing by experienced men, at fifty-three cents an hour, will cost the operators less in waste of coal and in damages for accidents than the old arrangement did. This point was unyieldingly demanded and reluctantly conceded. It is regarded as one of the greatest gains ever won by the United Mine Workers.

OPERATORS BEAR BRUNT OF FIGHT

The operators were as deeply aggrieved —and with good reason—by having the resumption of work so long delayed on account of a disagreement between the officials of the Illinois miners and the national officers of the United Mine Workers of America. This difference was immediately due to what the Illinois men resented as an interference by the national officers with the prerogative of the district organization to settle the details of the wage scale with their employers. The Illinois Coal Operators' Association protested against this as a disturbance of the competitive balance between them and the operators in competing districts. The national convention of the United Mine Workers at first undertook to settle the details for the Illinois agreement. But when the Illinois miners rejected this settlement by a referendum vote of 12,075 to 80, a special convention of the national body was held.

There the Illinois men, led by their president, John H. Walker, fought avowedly against not only the policy of the national president, T. L. Lewis, but against him personally. The finish came on an appeal from a decision of the chair, the Illinois contention, defeating President Lewis and his adherents by a vote of 1,201 against 927. This vote settled the policy of recognizing "district autonomy, local self-government, and the authority to settle internal details of the wage scale as fundamental rights." It would seem also to settle all chance of President Lewis's re-election at the next regular convention. With this result, the Illinois delegates went home apparently satisfied and willing to negotiate the settlement with the operators.

The joint trade agreement now ratified runs for two years. Under it the average increase in wages will be eight cents a ton, which it is estimated will amount to a gain of $4,000,000 annually.

THE MINERS' THREE LEADERS

A dramatic incident of this struggle was the calling of John Mitchell to preside by President Lewis when this decisive vote was about to be taken. This situation was the more intense from the fact that much of the resentment toward President Lewis is undoubtedly due to the jealously critical attitude which he and the *United Mine Workers' Journal* under his administration have assumed toward Mr. Mitchell, who was his predecessor for many years in the presidency. The devoted loyalty of the miners everywhere, and especially in Illinois, to their former leader was enthusiastically expressed by the prolonged cheering which greeted Mitchell when he took his seat as a member of the convention. When Mitchell temporarily took the chair, he was still further embarrassed by the fact, that while favoring most of the Illinois contentions he had objected

to one or more of them. But his good judgment, calm manner and great influence kept the convention strictly within parliamentary bounds in settling decisively the acute differences which threatened to rend its membership.

John H. Walker is also an interesting figure in all these scenes while conferring with the operators, addressing the mixed multitude of miners, or taking his prominent part in the heated discussions of the convention. Winsome in appearance, affable in manner, alert in mind, shrewd in argument, impassioned in speech, quick in judgment, determined in resolution, resourceful in tactics and with power in reserve, he is a born leader of men, in a cause to which he is so unreservedly devoted as that of the United Mine Workers. Perhaps his followers could not say of him what one of them said of John Mitchell, "I would die for him," but they have followed him unfalteringly through all the hard stress and strain of these trying months. And that is no small test of leadership when upon it were staked the livelihood and the future prospects of 70,000 men and their families, speaking a score of languages and having great differences in intelligence, temperament, self-discipline and experience. While an avowed socialist, he never subordinates or sacrifices his trade unionism to either the ideals or propaganda of socialism. At this point John Mitchell differs from him in refusing to share any part of his loyalty to trades unionism with socialism.

STRENGTH OF THE OPERATORS

Among the operators there are some strong, well-balanced, fair-minded, broad and considerate men. Some of them have the ruggedness of the miners' own ranks, in which they worked from boyhood and from which they came to ownership. Others of them have the discipline, scientific equipment and culture of the schools, supplemented by experience in mine construction and management. None of them stands out as prominently in the leadership of the others, as do the labor leaders among the miners. But, as a body of men, they are in advance of many groups of associated employers who boast of a leadership which they do not maintain.

It is to these qualities of head and heart, which to some extent have been shared by the leaders on both sides of this struggle, that its patient and peaceful progress toward solution is due. No violence or serious breach of personal relation has blackened the memory of this long and trying deadlock. The nearest approach to wanton destruction of property was the calling out on strike of the pump men and engineers, which not only permitted the flooding of the mines, but prevented the construction and reconstruction for which the new law for the protection of mines and the safety of life from fire called. This is justified by the strike leaders as a "war measure." But it was not considered justifiable even as such at the national convention of the United Mine Workers, whose officers creditably endeavored to undo this wrong.

TESTS OF POWER ON BOTH SIDES

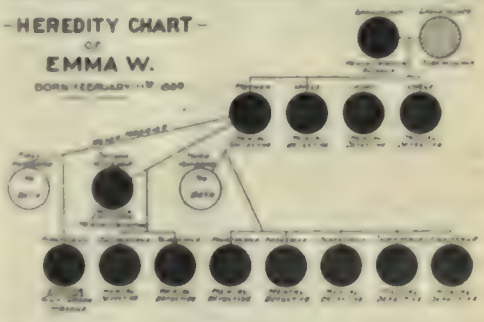
The strength of the miners' organization is attested by the fact that the funds and assessments proved adequate to the support of from 45,000 to 72,000 men and their families during six months of their dependence. Their loyalty to each other was tested by the vote at the special convention, to raise the assessment upon the working miners for the maintenance of the men on strike from twenty-five cents a week to one dollar. The strength of the operators' association was demonstrated not less in holding together their own membership, than by their patient continuance in dealing with their organized employes, and in maintaining an attitude which will put them in position to influence the United Mine Workers of America in the future as they have done in the past.

THE TREND OF THINGS

On the preventive side of the problem of industrial accidents, it is interesting to notice that two of the large liability insurance companies have in the last year published books on safeguarding machinery. Safeguards, by David Van Schaack of the Aetna Life Insurance Company, is general in scope. The education of the workman by printed rules, together with the careful enforcement of these rules by the superintendent, he holds to be the first essential. Then come those general conditions for which employer and superintendent can alone be held responsible—insufficient lighting, overcrowding, bad ventilation, and uncleanly conditions liable to cause fire or dust explosions. About a dozen pages are devoted to simple methods of safeguarding common types of machinery, and the rest of the book, over one hundred pages, to illustrations, photographs taken by Aetna inspectors, of particular types of safeguards.

The handbook of the Fidelity and Casualty Company, by F. E. Law and William Newell, well known engineering experts, follows the same general plan as the Aetna book. It is to be followed by a series of detailed pamphlets devoted to specific industries. The lowering of the fire hazard in factories is the object of a handbook of the Hartford Fire Insurance Company and an elaborate series of thirty-five pamphlets issued by the National Board of Fire Underwriters.

* * *



From England word reaches us of two important government investigations, that on children in street trading and that on lead poisoning in the pottery works. The departmental committee on the employment of children act of 1903, finds 37,000 children employed in street trading and subjected to moral influences calculated to undermine character and to produce a decline or disability for more regular employment. Equally disastrous the committee finds the effect on physical health of long and irregular hours and of exposure to weather and to vicious habits. It makes the following recommendations for the regulation of street trading:

"(a) That the inferior age limit be raised to seventeen for boys and eighteen for girls; (b) that street trading be defined to cover all ways except the delivery of goods by tradesmen's employes to regular customers; (c) that the execution of the law be left to the education authorities and all cases be tried, where such a court exists, in the children's court.

The departmental committee on the pottery reports an investigation covering 550 potteries, employing 63,000 persons—out of a total of 74,000 employed in all potteries in the United Kingdom. The special dangers to health are lead poisoning, to which eleven per cent of the workers are exposed, and the inhalation of dust, which affects thirty-six per cent. The latter proves to be the more serious menace and the cause of seven in a thousand deaths among those affected, the former of only eight-tenths per thousand. The committee would recommend reducing the use of lead in pottery to a minimum, its total abolition being impracticable at the present time. It further recommends a large number of safeguards calculated to minimize the danger from both dust and lead, but would put special emphasis on the enforcement by inspectors of certain simple precautions, believing that the principal source of danger is carelessness in superintendence.

The first annual report of the board of managers of Letchworth Village contains much that is interesting. The commission appointed in 1907 by Governor Hughes, to ascertain the number of defectives in New York state needing custodial care and to select a site for the Eastern New York Custodial Asylum—thereafter to be renamed in honor of William Pryor Letchworth—completed its investigation and found some 20,000 defectives in the state, of whom only 5,500 receive custodial care. In 1909 the state acquired for $197,520.41, a site of 2,000 acres in Rockland county, near Haverstraw, suitable for farm and other forms of outdoor work, which are

essential in the care of epileptics and the feeble minded. The site is accessible to New York city, has a good water supply and drainage, and 750 acres of the land are now under cultivation, including fifteen orchards. The tract contains a deposit of brick clay, a permanent supply of cord wood, a gravel pit and two ice ponds. There are fourteen houses, eight cottages, twenty barns, granaries and wagon houses and the committee urges that these be repaired immediately and sufficient additional dormitories be built to accommodate in all, about 150 men. The cost would be $45,000. It is estimated that the total cost of the village, which will take five years to complete and will provide for 2,600 persons, will be $2,405,000. It will be a country community widely spread out to segregate sexes and different classes of defectives. The buildings will be of moderate size and simple construction. The board of managers, of whom Frank

A. Vanderlip is president and Franklin B. Kirkbride, secretary, urges a sufficient appropriation from the Legislature to carry on without interruption this work of housing many defectives who are now at large. The report contains an interesting chart of one defective family of whom only one member, the Emma W. from whom the chart is named, is now receiving custodial care.

Delos F. Wilcox, chief of the Bureau of Franchises of the Public Service Commission for the First District of New York, is writing in two volumes an account of Municipal Franchises in the United States[1], a "description of the terms and conditions upon which private corporations enjoy special privileges in the streets of American cities." The bulky first volume of seven hundred pages has already been issued. It contains "an introductory analysis of the modes of acquiring franchise rights, of the nature of franchises, and of the various possible means of restricting public utility monopolies under private operation," and then treats of "pipe and wire franchises"—electric light and power, the telephone, the telegraph, electrical signals, electrical conduits, water supply, sewerage, central heating, refrigeration, pneumatic tubes, oil pipe lines, and artificial and natural gas. Volume II will discuss transportation and terminal franchises and will give "general observations and conclusions in regard to the taxation and control of public utilities."

* * *

No. 6 of Studies in American Social Conditions[2] deals with Concentrated Wealth, and is a sixth useful outline for study and bibliography prepared by R. H. Edwards, of Madison, Wis. Though prepared primarily as guides for "social problems groups" like the original "group" which Mr. Edwards organized in Madison four years ago, these outlines are also valuable for personal study and for the use of many kinds of clubs and classes and societies, interested in studying social conditions. Four more subjects will be treated in the series: Business Morals, Country Life, American Women, and The Church.

* * *

A fascinating collection of samples of business reform effected in the administration of the New York city government in the first six months of 1910 has been issued by the Bureau of Municipal Research.[3] At the top of the cover is a big interrogation mark, and beneath it a comment on some of the economies from a Brooklyn paper: "To hell with reform!"

The improvements enumerated are only illustrations from the complete list which will be furnished by the city officials themselves in the Budget Exhibit in October. At the end of the brochure is the warning that "it takes months and years to give up old habits and to acquire new habits"; that there is still much to be done; and that, to keep what has already been won and to go further, the citizens who appreciate these changes must "persist in their support until those who understand them will outnumber those who do not understand them."

* * *

The *World's Work* for September contains two articles of social interest. In Good Tenements for 1,000,000 People, Emily A. Dinwiddie tells what has been accomplished by the New York Tenement House Department in the ten years of its existence. Eugene F. Bertrand in Giving the Convict a Chance sets over against the the penal system of the whole world the experiment of Thomas J. Tynan, warden of the Colorado State Penitentiary at Cañon City. A square deal and a useful day's work is the warden's system of restoring to moral health fully half the prisoners in the penitentiary. The men whom a few months' close observation within the penitentiary walls has shown to be worth the experiment are sent to make the state roads, working eight hours without stripes and with unarmed overseers, sleeping in open tents with nothing but their sense of honor to prevent their escape. The experiment has been going on for a year and so far has met with wonderful success as a test of the honor system applied to prisoners. Much is to be hoped from it, Mr. Tynan believes, both as a means of developing a sense of responsibility and of building up robust out-of-door health which will stand the prisoners in good stead after their term is over. Mr. Tynan holds that a large proportion of convicts "are not habitual criminals from choice."

* * *

The report by W. H. Atherton, executive secretary of the first year's work of the City Improvement League of Montreal, shows the first steps taken in "cultivating a spirit of right citizenship in order to make Montreal clean, healthful and beautiful." The league acts in co-operation with the Architects' Association, tuberculosis and playground societies, women's clubs and other organizations for social improvement, and within the year its offices have come to be regarded as an unofficial bureau of grievances through which complaints can be conveyed to the City Hall. By thus calling official attention to official neglect, better sanitary inspection of buildings and better enforcement of regulations regarding spitting in streets and buildings have been obtained. The work of arousing public

[1] Municipal Franchises. In two volumes. By Delos F. Wilcox, Ph. D. Engineering News Book Department, New York, 1910. Pp. 710. Vol. I. THE SURVEY, 105 East 22d street, New York, postpaid $5.18.

[2] Concentrated Wealth. Publication No. VI of the Studies in American Social Conditions. By Richard Henry Edwards. Madison, Wisconsin. R. H. Edwards, 1910. Pp. 39. By mail of THE SURVEY, postpaid, 12 cents.

opinion against bad housing, dirty streets and insufficient playgrounds has begun, and an appropriation for a commission to study city planning has been obtained from the Provincial Parliament. Through the public school authorities, too, school gardens have been established.

• • •

The 1910 reports of the Juvenile Court of St. Louis, Mo., is commended to all juvenile court workers. It blazes the way in the matter of annual reports, and was prepared for the purpose solely of presenting the work of the court in a serious and scientific manner. Beginning with a brief historical account, Roger N. Baldwin, chief probation officer, describes the court system—its work from October, 1908, to March, 1910—its needs, viz.: more paid probation officers, longer assignments for the judges who sit in the court and a new detention home. Mr. Baldwin gives further a careful text analysis of the tables presented by him. The statistics were compiled from the records of the probation office by Anne M. Evans, formerly of the United States Department of Commerce and Labor, and were criticised and revised throughout by John Koren.

That part of the report on the organization of the probation office will be especially helpful to other communities. The probation office of the St. Louis court is most efficiently organized and, so far as it is possible to do so, Mr. Baldwin describes its organization and methods. Too many probation offices unfortunately are wholly unorganized and to those, as well as to offices to be organized, the report will be of inestimable help. It contains in addition to the juvenile court law, laws concerning contributory delinquency, the Missouri Training School, State Industrial Home for Girls, the compulsory attendance law, child labor law, regulations governing the House of Detention, and rules touching the court and probation office promulgated by the circuit judges covering subjects not expressly provided by law.

The pamphlet is a most useful handbook for juvenile court judges, probation officers and persons interested in the court. It will be sent to any address upon receipt of four cents to cover postage.

• • •

THE SURVEY has already given an account of the great twenty-fifth anniversary meeting of the Minneapolis Associated Charities. As a sequel now comes a pamphlet called A Quarter Century of Work Among the Poor, which not only contains the annual report of the Associated Charities, but a graphic description of the progress of twenty-five years. The Minneapolis society is one of the oldest in the country. It is situated in a district where the speed of development is pretty rapid. Yet it has had a career with some strangely marked periods of decline, and of revival. The last eight or ten years, however, have seen a steady rise to greater and greater influence and greater and greater effort. The story is simply related, but by this simplicity the marvelous growth is all the more strikingly told. As a twenty-five years resumé this report is in many ways a model. The society has run off an edition covering only the twenty-five years' report and comments on the work of 1909, omitting all material which is of local interest primarily, and copies of this will be sent upon application.

• • •

The Indiana Board of State Charities has issued a summarized history of the development of public charities and correction in Indiana from 1792 to 1910, similar to its earlier publication in 1905. It is the sort of compendium which we could wish to have in regard to every state in the Union, and it should facilitate the education of the people of Indiana, in schools and colleges and outside of them, in respect to the provisions for dependents and delinquents of that state. Copies of the pamphlet may be had by addressing the secretary of the board, at the State House in Indianapolis.

• • •

A much needed compendium of the laws of the various states of the Union, relating to vagrancy, has recently been published by the Michigan State Library for the use of the commission appointed in Michigan to investigate the subject of vagrancy.

One of the misfortunes in dealing with vagrancy in this country has been the absence of a similar compendium. It is to be desired that, in addition to this compilation, the laws relating to vagrancy and similar offences should be so tabulated as to furnish quickly clear comparative facts which the present compilation does not give. Copies of the compilation may be obtained from W. S. Foster, Lansing, Mich., free of charge.

COMMUNICATIONS

THE PAGE BILL

TO THE EDITOR

In a letter to THE SURVEY for September 17 Mrs. Annie Nathan Meyer says that "the first step in this war should be the recognition by the medical profession that single standard of morals is a possibility." I agree with Mrs. Meyer that we must first find out whether the single standard of morals is possible or not. If it is possible, then we should pass no legislation which condones a double standard of morals. If, on the other hand, there is a "sexual necessity" for men, then we should recognize that the women who minister to this "sexual necessity" are performing a valuable social service and honor them—not ostracize them.

It would seem, however, that the fact that self-control is both possible and healthful to

men had already been established. There may still be a difference of opinion on the part of some provincial medical men, who seek to excuse their own past rather than to teach the plain facts of physiology. But, with those exceptions, the stand of the medical profession is simple and definite. At the international congress held in Brussels for the prophylaxis of syphilis and the venereal diseases, in which every civilized country of the world was represented, the unanimous expression of the distinguished specialists was that "continence is not prejudicial to health, but is to be recommended from a purely hygienic point of view." The German society for the prevention of venereal diseases declared that "sexual continence is, in the unanimous opinion of the medical profession, generally not injurious to health, as is commonly supposed." Modern scientific medicine has demonstrated beyond a doubt that the degradation of women is not necessary to the health of men.

In the last part of her letter Mrs. Meyer expresses a fear that giving the vote to women would promote hasty legislation on this subject. Here again the facts are easily ascertainable. In the places where women vote, the legislation which has affected the social evil has in no case been hasty or repressive. It has all been in the direction of giving greater protection to women and so lessening the chance of their being driven into prostitution, through seduction, unendurably long hours of work, or starvation wages. In Wyoming where women have voted for forty-one years on equal terms with men, the age of protection for girls is twenty-one. In no other state is it over eighteen. In Colorado, where women have voted for seventeen years, women are allowed to work only eight hours a day (when the work is done standing). In most other states they can work from ten hours a day up. Such examples could be extended indefinitely, until in New Zealand we find that, in order to protect girls from being driven into prostitution, not only have their hours of work been shortened by law and their sanitary conditions been improved by law, but the law has fixed the minimum wage that can be paid to women.

It is suggestive to compare such laws with those of New York where women are not voters. The only recent legislation in New York in regard to the social evil has been to try to make the degradation of women a little safer for men,—and this in the face of the fact that similar legislation has proved worthless after one hundred years' trial on the continent.

Hartford, Conn.

LIGHT ON MOVING PICTURES

TO THE EDITOR:

We have received many inquiries from puzzled social workers and city officials around the country as to this question: Must moving picture shows be given in a dark auditorium, with all the lack of social spirit and the tendency to careless conduct which a dark auditorium leads to?

May we answer through your columns, that moving picture shows can be and many are being given in broad daylight without any loss of effect. They are, moreover, being given in auditoriums where individuals can be recognized from end to end of the hall and where programs can be read without strain to the eye.

The methods are altogether simple: The screen on which the moving picture is thrown must be sheltered from the direct rays of light, and the eyes of the audience must be similarly sheltered. Where picture shows are given in broad daylight it is the custom to construct a sort of hood over the screen, into which the daylight only penetrates by reflected rays, and the picture, in contrast with the extreme brightness outside, appears in all its clearness of outline and depth of shadow. Where it is desired to light the interior of an auditorium during a picture performance, the method is equally simple: No intense light must be seen, but the auditorium must be illuminated by a diffused light thrown from lamps whose rays do not travel direct to the picture screen or to the eyes of the audience. In practice, the method is to shelter the electric lights by means of a ledge either around the wall or into the ceiling, so that the rays of the lamps are thrown along the height of the wall or across the ceiling and are merely reflected in a diffused way into the body of the auditorium.

It is impossible here to give detailed specifications for lighting interiors, but the principle given above can be made use of by any intelligent architect or owner of a picture theater. Those who are interested can obtain specifications from the Board of Censorship.

As a matter of fact, many exhibitors are probably informed about methods for lighting the interior of their show, but do not utilize these methods because of the additional expense for electric current. The public which patronizes moving picture shows is too tolerant even in the matter of program, and still more tolerant in the matter of sanitation and general comfort within the show. If there were a definite public demand, exhibitors would quickly learn how to light the interiors of their shows. Settlement workers and other social workers can create such a demand in their own neighborhoods. Moreover, it would seem the duty of the municipal authorities in each city to enforce a minimum of lighting, as of ventilation, in all moving picture shows.

JOHN COLLIER,
Educational Secretary.

New York.

FOREIGN DELEGATES VISIT OUR PRISONS

Delegates to the International Prison Congress to the number of 150 completed on Wednesday of last week at Washington a tour of inspection of over 2000 miles, as guests of the federal government. More than a score of nations were represented on this trip, which started from Jersey City on September 18. Among the institutions visited were Elmira Reformatory, the George Junior Republic, Auburn State Prison, Mansfield (Ohio) State Reformatory, Illinois State Reformatory, Indiana State Prison, Illinois State Training School for Girls and the Indiana State Reformatory.

Several events marked this tour as unique in the history of prison congresses or conferences of charities and correction. The arrangements and administration of the trip have undoubtedly never been equalled. The civic spirit manifested in the various cities visited amazed the foreign delegates. Banquets, receptions, automobile tours, and the wide open policy of prison inspection will mark for years to come the ten day tour of the delegates from across the water. While our correctional institutions have not failed to draw criticisms in certain particulars, mainly structural, the general policy of institutional development has been a revelation to our foreign friends and even to many Americans. The delegates were particularly interested in the development of the cottage or farm plan of caring for delinquent children.

At Louisville, on September 27, the American members of the party presented to F. H. Mills, who managed the tour without compensation and with an immense amount of attention to detail, a valuable diamond as a token of their appreciation of his efforts, which have extended through the twelve months prior to the beginning of the trip.

The tour ended in time for the annual meetings of the American Prison Association and the American Institute of Criminal Law and Criminology in Washington, September 29 to October 2, after which many of the members stayed to take part in the section and general assembly meetings of the international congress.

The meeting of the American Prison Association was characterized by an excellent program, thoughtful addresses and a marked feeling of optimism. The keynote was perhaps twofold: first, that humanity should characterize every dealing of a prison administration or other officials with the criminal, but that the mistake should not be made of a too lenient or erratic form of treatment. Second, that the whole country stands much in need of far more accurate information regarding its criminals than it now possesses. Both Mr. Hall of Minneapolis and Sir Evelyn Ruggles-Brise emphasized the absence of criminal statistics.

Five committee reports were presented, each furnishing material for discussion at one session. The themes—discharged prisoners, reformation and parole, criminal law, probation and prison discipline — were specially discussed. The attendance from most of the states was good and the entire series warranted the statements made by some of the older members of the association, that the meetings this year represented the best that the American Prison Association has reached.

Of special interest was the union in spirit as well as in fact with the International Prison Congress, which held its first meeting October 2. Many of the delegates from abroad were attentive auditors at the sessions of the American organization and a joint meeting of the two associations was held on October 2.

The 1911 meeting of the American Prison Association will be held in Omaha. T. B. Patton is the president for the ensuing year. To Amos W. Butler, retiring president, and to Joseph P. Byers, general secretary, is due largely the success of this year's meeting.

In a later issue THE SURVEY will give an adequate report of the meetings of all three organizations.

CHANGES IN NEW YORK CHILD LABOR LAWS

A number of regulations making a new standard in the laws of New York with respect to the employment of children went into effect October 1. The most sweeping restriction, the new law, prohibiting in first and second class cities the employment of boys under twenty-one years of age after 10 P. M. or before 5 A. M. as telegraph messengers, is the result of a recent investigation of the night work of messenger boys in tenderloin districts of large cities. Their intimate contact with disorderly houses and their surrounding evils was proven so conclusively by the New York Child Labor Committee in advocating the bill, that the Legislature went to the limit in extending the law's protection. The extension of this law to include all minor messenger boys marks a new era in child labor legislation, and places New York at the head of all the states in the protection of minors. In New York, Buffalo and Rochester this law will be enforced by the Mercantile Bureau of the State Department of Labor. The past record of James L. Gernon, head of this bureau, in enforcing the labor law in mercantile establishments is such that it is confidently believed this new law also will be effectively enforced. It is deplorable that the number of inspectors—eight for New York, Buffalo and Rochester—is so inadequate. Until the Legislature makes possible the appointment of more, it is not to be expected that the ground will be covered completely. In second class cities the enforcement of the night messenger boy law is in charge of local health officers.

For the first time the labor law now makes specific reference to boys setting up pins in bowling alleys, and the employment of children as messengers, ushers, or checkers in places of amusement. Hereafter such work is forbidden for children under fourteen, and under sixteen unless in possession of a regular employment certificate, and then only between the hours of 8 A. M. and 7 P. M. Theaters employing boys as pages or in the distribution of water or other articles will be directly affected by this new law. While in many instances the work is not hard, it is open to serious objection for young children, as it frequently means their returning home alone late at night.

Another new provision (affecting only cities outside New York, Buffalo and Rochester) prohibits the employment of children under sixteen after 7 P. M. in mercantile establishments. This has been the closing hour for several years in the cities mentioned, and is now extended to cover the smaller cities. Proprietors of department stores in upstate cities, who desire to continue using children under sixteen, will have to rearrange their schedule of hours so that their junior help shall not be employed later than 7 P. M. This applies equally to Monday and Saturday evenings, and to the rush season prior to Christmas. It will be the duty of health officers to enforce this law except in first class cities.

Many important changes in and additions to the labor law were made by the Legislature last winter at the request of John Williams, commissioner of labor. One of particular importance in relation to the welfare of children was the addition of two kinds of machinery—metal or paper cutting machines, and corner staying machines in paper box factories—to the list of dangerous occupations in connection with which the employment of children under sixteen is prohibited. This list was originally incorporated in the law in 1909 at the request of the New York Child Labor Committee.

REORGANIZATION OF WEST SIDE HOUSE

John D. Rockefeller's splendidly equipped settlement, the West Side Neighborhood House at Fiftieth street and Tenth avenue, New York, which was closed last January, will be reopened in a few weeks under a new name, the West Side Institute, and under a form of management new in settlement work. The more prosperous neighbors, merchants, factory owners and professional men of the middle West Side, together with clergymen and social workers, feeling that the settlement had filled a real need in the community, got together and with the co-operation of Columbia University, which promised all the pupil-teachers they needed for the institute classes, devised a plan by which the work could be continued on a democratic basis. The board of directors, consisting of Mgr Joseph Mooney of the Church of the Sacred Heart on West Fifty-first street, the Rev. Winfred V. Ackert of the Vermilye Chapel, 416 West Fifty-fourth street, besides many business men and Edward Ewing Pratt, instructor in Columbia, William Fellowes Morgan and William C. Demorest, representing the trustees and the alumni of Columbia University, guarantee $10,000 to meet expenses, including a reasonable rent. It is expected, however, that a large part of this sum will be met by fees paid for the various courses offered.

The work planned includes reading and billiard rooms, social and musical clubs, gymnasium, classes in trade training, typewriting and stenography, salesmanship and domestic science, as well as a kindergarten, day nursery and other settlement activities.

CLEANING UP AMERICAN CITIES

Toward the close of September the Rev. Caroline Bartlett Crane of Kalamazoo, Mich., sanitary expert, began a five weeks' inspection of about a dozen of the largest cities of Minnesota. Since last March Mrs. Crane has carried on her distinctive work, which is to make a rapid, though often a surprisingly thorough, study of a locality in all its sanitary aspects. In two Pennsylvania cities, in Nashville, Tenn., and in twelve cities of Kentucky, her inquiry covered water supply, condition of the streets including garbage disposal, sewage, housing, markets and other food shops, milk supply, school sanitation, parks and playgrounds, jails, hospitals and other institutions, public health system and such features of the city charter as have a bearing on democratic control of public works. To each of these cities she went at the invitation of public health and other officials, chambers of commerce, the Federation of Women's Clubs and various organizations of social workers. Representatives of these bodies accompanied her on her tours of inspection and under their auspices she spoke every evening to crowded halls.

Her lectures were those of a "public housekeeper," simple and untechnical. As an outsider she was able to report exactly what she found without partisanship or that fear of incurring disfavor in high places which might be felt by a citizen of the locality. At the close of an inspection a full, written report was submitted to the various bodies at whose request it was made. These reports, as well as the public lectures, made such specific suggestions for improving conditions as a person with a general knowledge of sanitation is competent to make. Where more technical opinion was required, they recommended the employment of experts in the particular branch of work to be undertaken, and pointed out what public or volunteer bodies were needed to take charge of special branches of public work.

This setting on foot of permanent movements for civic improvement would seem to be the most valuable side of Mrs. Crane's work. The *Kentucky Medical Journal* followed up her visit by pressing for such a movement throughout the state, and in Frankfort, at any rate, the first steps in this direction have been taken. A year after her visit to Calumet, Ill., a public official stated that the sustained effort of the citizens had changed Calumet from a mining camp

to a beautiful city, with good streets well cleaned, parks and playgrounds, a well stocked public library, and a well organized system of charitable relief. Three months after inspection the mayor of Nashville announced that a strong civic reform movement was on foot. Erie, Pa., spent a year trying to improve conditions and then sent for Mrs. Crane again to pass upon results, and the citizens of Louisville, Ky., after a general inspection, became so deeply interested as to try to obtain her services for a more detailed study of their sewage problem.

In how many cities the enthusiasm which attends the "revival" methods of what the newspapers call the "civic evangelist," dies down without permanent results, it is impossible to say. However, even such definite, immediate results as the cleaning up of the market and the repairing of the streets of Nashville, the condemning and rebuilding of a county almshouse in Kentucky, and the passing in that state of health laws which the health commissioner, Dr. J. N. McCormack, says are thirty years in advance of what he could have accomplished by ordinary means, are not to be despised. There seems little doubt, too, that the very exposing of bad public housekeeping to the frank criticism of a disinterested stranger is itself a stimulus to reform.

Nor is Mrs. Crane the only professional civic revivalist. On September 10 the public officials and private organizations of Indianapolis invited Lawrence Veiller to inspect the city and make recommendations regarding housing conditions. Mayor O'Malley of Geneva, N. Y., inaugurated a cleaning-up week in that city; he himself and a representative committee of citizens made an inspection, and followed this up by inviting Prof. Charles H. Zueblin to make definite recommendations for improvement. The report is that experts have already been engaged to devise a park and playground system for Geneva.

In Boston the Woman's Municipal League has been conducting a campaign of education in sanitation by means of a travelling exhibit. Since last spring the league, in co-operation with South End House, has paid the salary of a woman inspector of the Board of Health. This woman found the condition of the markets in the congested parts of the city revolting and soon began in a small section of the city to arouse public opinion. The league's inspector of streets and alleys found a like condition of filth in the streets and in the homes. She too began educational work in a small way, and the two met to form a definite campaign of sanitary education which began by an exhibit sent to the Boston-1915 Movement. Since December the exhibit, which on the sanitary side shows contrasting models of dirty and clean meat markets, of clean dairies and dirty ones, and which also spreads the propaganda of prevention and cure of tuberculosis, has been shown in many of the settlements and other social centers. It has aroused the deepest interest in the different neighborhoods. Clubs of women have been organized all over the city, who under the direction of the league inspectors are taking the first steps toward raising the standard of cleanliness and health.

The Boston movement, unlike the movement in other cities, does not depend on stimulation of interest by an outside expert. A printed report of the method of the Boston league by the president, Mrs. T. J. Bowlker, can be got from the headquarters of the league.

LITTLE VARIATION IN WORK-ACCIDENT RATES

The statistical study of work-accidents and their economic consequences continues. The law of Minnesota, which provided for a Commission on Employers' Liability, requires every employer to report to the Bureau of Labor all accidents occurring in his establishment.

A recent investigation of 300 of these reported cases with special reference to the compensation received, conducted under the direction of Don D. Lescohair, special agent of the Bureau of Labor, confirmed the conclusions reached by

similar inquiries under the Pittsburgh Survey, the Wisconsin Industrial Accidents Commission and the New York State Commission on Employers' Liability: Under American employers' liability laws, but a small proportion of the workmen injured by accidents of their employment and the dependents of those killed receive anything approaching adequate compensation.

Mr. Lescohair and his assistants found that among fifty-four families of men killed fifty per cent received no compensation; twenty-four per cent, $1,000 or less; fourteen per cent $2,000 or less; and only eleven per cent over $2,000. $530 with funeral expenses was the average compensation in case of death. In five cases of permanent total disability, one man received $160, one $175, and the others nothing. In fifty cases of serious but not permanent injury, six of the injured did not receive even medical expenses, and four medical expenses only. Seven, however, suffered no financial loss, receiving medical expenses and full wages for the time disabled, and eighteen settled for a considerable sum in addition to expenses and wages. This last item, which is rather surprising, is not borne out by results of similar investigations in other states. It does not, however, serve as a defense of the present employers' liability system but rather emphasizes the unevenness and arbitrary inequality of recoveries under that system.

NEW YORK CONFERENCE OF CHARITIES AT ROCHESTER

The eleventh New York State Conference of Charities and Correction will be held in Rochester November 15-17. The officers are, George A. Lewis, president; Frank E. Wade, secretary, and Frank Tucker, treasurer.

Two new problems, the pressing importance of which the public has just begun to recognize, will be considered, namely, the distribution of population, on which Robert W. Hebberd will speak, and the need of moral and sanitary prophylaxis. The committee appointed to cover the latter subject has not yet completed its program.

The committee on public health and safety will be under the chairmanship of Dr. W. H. Smith and discussion will be based on papers on the Conservation of Eyesight by Samuel E. Elliott, and on Alcoholism by Menas S. Gregory.

The committee on public institutions and public co-operation, of which Mrs. Milo M. Acker is chairman, will present papers on The Relation Between Society and the Hospital by Dr. S. E. Goldstein; Are Almshouses an Integral Part of the Social Order? by Joseph C. Baldwin, and Social Sympathy in the Work of State Hospitals by Dr. August Hoch. Papers to be presented by the committee on the care of children, of which Edmund T. Butler is chairman, are: Some of the Destructive Forces at Work on the Child by Dr. Charles F. McKenna, and Pensions for Widowed Mothers by Mrs. William Einstein. Anna B. Fox will act as chairman of the committee on the care of the poor in their homes, which will discuss papers by Mary Breed on The Problem of the Treatment of Widows, and of Deserted Wives by Roy Smith Wallace, on Problems of Tuberculosis Relief by Francis H. McLean, on The Work of a State Commission of Distribution of Population by Robert W. Hebberd, and on Foreign National Policies for the Distribution of Population for which a speaker will be assigned later.

COMPENSATION FOR INDUSTRIAL INJURY

Compension for industrial injuries is a subject occupying the attention of special commissions now at work in Wisconsin, Massachusetts, Minnesota, Ohio and New Jersey. A similar commission in Illinois has failed to propose legislation owing to an unfortunate disagreement. The Wisconsin committee, which is made up of members of the Legislature, is nearing the end of its work. Its bill will be introduced into the Legislature next January and the complexion of both houses, as indicated by the recent pri-

maries, practically assures its passage. Wisconsin's enactment of an employers' liability and workmen's compensation law will be watched with interest, not only by existing commissions, but by students of the problem in every state, notably in Michigan, Oregon and Missouri, where commissions will probably be created within a year.

Wisconsin's tentative bill, which has been the subject of close study by other commissions for two months, abrogates absolutely the defenses of assumption of risk and fellow-servant's negligence, but does not change the contributory negligence defense. A complete system of compensation is included in the bill, with an "industrial accident board" of three members to act in cases of disputes. The board is to have power to name examiners to take evidence. Appeals to the circuit and supreme courts are made possible but the judges are empowered only "to ascertain whether the findings of the board sustained the award upon a proper construction of the act."

The secretary of the Wisconsin committee, Paul J. Watrous of Madison, has submitted the last draft of the bill to students and authorities in every part of the country, and at an early date the committee will discuss the resulting criticisms and make changes as suggested. It is probable that another public hearing will be held before the final bill is reported.

The Massachusetts Commission on Employers' Liability, of which Dr. C. E. Doten is chief investigator, is taking the initiative in calling a conference of all state commissions at some central western city in November. It is necessary for the Massachusetts commission to make its report before the end of the year, and for this reason it desires a conference before the fourth national conference set for December in St. Louis.

MEETING TO STUDY INFANT MORTALITY

The American Association for the Study and Prevention of Infant Mortality, with headquarters at 1,211 Cathedral street, Baltimore, Md., which was organized as a result of the conference on infant mortality held at New Haven last November, will hold its first annual meeting in Baltimore, November 9-11. Those who have studied the problem of infant mortality and attempted its solution have demonstrated beyond a doubt that the infantile death rate can be cut in half by carefully applied preventive measures. It is with the object of arousing the public conscience to the need of such measures that the society, which has among its officers Dr. J. H. Mason Knox of Johns Hopkins and Dr. Linnaeus La Fetra of New York, began its educational work. The dominant notes of the November meeting will be prevention, conservation, education. The program will include a session on the municipal, state on federal prevention, under the chairmanship of Dr. William H. Welch; on philanthropic prevention, under Dr. Hastings H. Hart; on medical prevention under Dr. L. Emmett Holt, and on educational prevention under Dr. Helen C. Putnam.

The work which the association has laid out for itself is first of all to secure all over the country the prompt registration of births, both for the sake of getting reliable statistics and of enabling boards of health to take prompt measures to prevent infantile blindness, etc. The other features in the program of work are the encouragement of maternal nursing, the establishment of milk stations, education for parenthood, and the education of mothers in the care of children, the public control of sources of infection and the improvement of social conditions.

Though some thirty cities in the United States have milk stations, of which the Straus depots in New York are among the first in the world, and the municipal work for pure milk in Rochester will bear comparison with that of any city, this country has lagged behind the rest of the world in the protection of infants, and it is hoped that the new association will bring into existence a national movement worthy to take its place in the international congress to be held in Berlin next September.

HEALTH OFFICERS

WILLIAM CHARLES WHITE, M. D.
Pittsburgh

Not long ago a smallpox epidemic broke out in Cleveland. The mayor then in office did not believe in what is now known to be the proper preventive course to pursue in such a state of affairs. Isolation and vaccination appeared to him silly and faddish. The state health officer went to Cleveland and held a camera conference with the mayor, who yielded only to the threat that if preventive measures were not at once instituted, Cleveland would be quarantined.

Here were two examples of public officers. The mayor believed that isolation and vaccination were silly. In this he was ignorant. In acting on his beliefs, however, he was wofully weak, for rather than draw the condemnation of those who controlled the business interests of his city, which would surely have followed the enforcement of the threatened quarantine, he acted against what he believed to be right. The state health officer, on the other hand, held fully to the justice of his beliefs and power, and exerted them to their utmost to obtain the best good for the state, the city, and all the people involved.

Two years ago a young man was made city health officer in Wheeling, W. Va. He was impressed with the horrible figures we deal with in the field of infant mortality. He felt sure from his interpretation of the law that he had the power to stop much of the yearly loss of life. To accomplish this he aimed first at procuring a pure milk supply for the city. He had the power to examine samples of milk sold in the city, but the examination was useless if the results were merely kept in his record books, so he decided in the face of the most vigorous protest to submit them to those who kept him in office for the purpose of safeguarding their health—the public. He published the results of his examinations in the daily press monthly, under the heads of preservatives, bacterial content, fat, and dirt. Today he has an almost uniformly good milk supply for Wheeling, for the public soon forsook the dirty milkmen and bought from the clean.

To put this type of man in office is to go a long way toward the solution of public health questions. The public wants protection and is willing to abet the protector. The individuals who make up the public, however, often say, from ignorance or selfishness: "I want protection, but I decline to bear any of the discomforts of placard, isolation, or vaccination which the public protection demands." This attitude is what makes the road of the efficient officer so hard.

The laws governing health conditions have been based upon the result of centuries of experience and scientific work, and are fairly uniform in the different states of this Union, as well as over the civilized world. They relate in the main to the field of what is known as preventive medicine. They control such decimating diseases as typhoid, measles, scarlet fever, smallpox, tuberculosis, and, in the South, malaria and yellow fever; and also the diseases that infect our food animals.

How well these laws are administered is common knowledge: those relating to the measles-smallpox group, fairly well now in most states, because we are used to them; those that affect our food animals, better; but the laws relating to some of the other diseases are almost inoperative. Yet the power is in the hands of our health officers to do wonders. The knowledge is available for them and the power of office is behind them, and with tact they could combine these two for the welfare of the community they control. A special despatch was sent out from Harrisburg recently to health officers: "Keep a sharp lookout for new smallpox cases; sixty to seventy new cases have appeared lately." Picture the day when such a despatch will read: "Keep a sharp lookout for new cases of infantile diarrhoea (or pneumonia, or tuberculosis); sixty or seventy new cases have appeared lately."

It is safe to say that, with few notable exceptions, present health administration has come not from within the health office, but from the demand of an accumulated public intelligence which has grown mainly through the voluntary work of medical associations and philanthropic organizations, national and local. It

often seems that health officers do just as much or just as little as public opinion forces them to do. Proper appointments in public health offices will bring about more progress than any other one thing. "If I were king," *i. e.*, governor or mayor, I would appoint a man for the work who would not only make himself a permanency, but would make me historical. I would choose a young man after conference with the known leaders of my profession. I would say to him: "Everything the law allows I want you to do to stop this loss of life. I will stand behind you in every effort. Choose your assistants for efficiency and not from political backing, and remember that the law of the city provides for your efficient administration." I would call his attention to the value of intelligent assistants and the necessity for the autonomy and interested action which every large business concern appreciates, and then I would help him work out his own salvation and the salvation of the municipal health. Many such men are to be found—I think as many as the offices.

The secret of his success would lie in his utilization on some uniform plan of all factors at work. He must correlate and distribute the labor as well as administer; he must educate and inaugurate new factors. He should not confine his attention to the means provided by the municipality. He should devote his efforts to the correlation of all factors interested in health work in his district—state, municipality, and private organization. He should seek to make adequate division of fields of labor to prevent waste and over-lapping of effort. He has fortunately, as a rule, a clear cut law behind him, and with the power of his office he is supreme in all matters pertaining to the health question. He may at times require police protection, but this he could usually obtain.

If this is the solution, then, it rests with the governors and the mayors who make the appointments to the health offices. These may roughly be divided into two classes, the fit and the unfit. The latter do not come within the scope of this discussion. As long as the people send unfit men to office, we cannot hope for much improvement in their appointments. But often in the fit class, men who are able men in law and business, giants of organization and management, honest and fearless, are bizarre in their medical entanglements. It may be because they are vigorous and seldom sick, or because they are suspicious of altruism, or I know not what, but I have often been struck with the apparent lack of intelligence on medical questions in many of our highest and most efficient public officers. Much of the fault may, of course, be on the side of the physicians. It may be a fault of our medical teaching that we cannot furnish men in whom these officials have confidence. It may be that the doctor who goes into politics is responsible. A man who bows forward to Aesculapius and backward to the demon of politics does not inspire confidence.

This policy of proper appointment could be actively furthered by a department or bureau of health in the federal government, and it is to be hoped that the day is not far distant when issuing from the federal government there will come instruction on uniform management of crusades against our common disease foes, which will be followed in each division of our country. What might have been the condition today if ten years ago a national department of health had been established, with an eminent, public-spirited physician at its head, outlining a national policy for the conservation of health to be followed in all states and through the state departments in all municipalities!

Until the day of proper appointment comes our voluntary associations for correlation, operation, and education must keep at work. If all voluntary organizations include in their education of the public a demand for competent appointments, it will not be long before each section of the country has that most potent of all public assets—a fearless man backed by public office, whose function shall include the proper correlation and distribution of work among all factors available in the municipality for the preservation of public health.

TO THE RESCUE OF NEW YORK HARBOR

CONSTANCE D. LEUPP

A prominent English novelist, a few years ago, made a trip through our country, and then went home and wrote about us. Unlike some of his predecessors, this novelist, disclaiming all but a superficial knowledge of our national characteristics and institutions, made a book not unfair as a whole. He was deeply impressed, as he steamed up New York harbor, by the Statue of Liberty; and again and again, in discussing cases of flagrant social and legal injustice which he encountered, he reverts to that bronze sentinel with her tireless arm and her crown of light, until the most patriotic American is forced to admit that the English critic has somehow made her out a sorry mockery.

ONE OF NEW JERSEY'S CONTRIBUTIONS.

Now comes New Jersey with a project calculated to make the cherished symbol itself fit subject for derision. Her proposal is to tap twenty-five of her municipalities with one titanic sewer, and deposit in the center of New York harbor, at the very feet of the statue, the drainage from the homes and factories of 600,000 people. Of course it would be a matter of pride for New York harbor to lay claim to the largest trunk sewer which has ever been built, but let us hope that Mr. Wells may not be here to see.

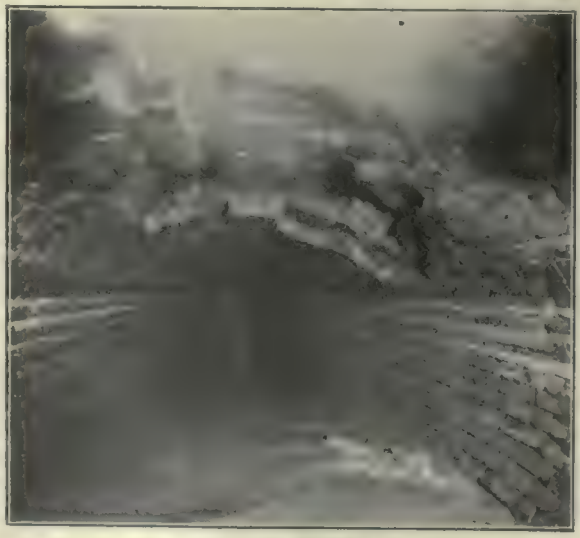
Let us even more devoutly hope that the people of New York will prevent the project from being carried through.

The situation at present is a very peculiar one. A suit was brought by the people of the state of New York and the United States government against the state of New Jersey and the Passaic Valley Commission to prevent the building of this sewer. An agreement was recently reached, however, between New Jersey and the United States government whereby the objections of the latter have been removed on the condition that the sewer shall not prove a menace to fish life. In default of a federal department of health the question, as far as the United States government is concerned, is confined to the protection of its fortifications, its soldiers and sailors. Since the New Jersey engineers have explained that they propose to screen and partly filter the sewer, the federal government is no longer concerned.

The state of New York, however, has not withdrawn her objections. Fortunately she was prudent enough to call for a report from the Metropolitan Sewerage Commission which has been studying the condition of the harbor and the rivers for four years. This commission strongly recommended that New York state make every effort to prevent the sewer

from being constructed, and that the city of New York join the state in this opposition.

The reasons stated in the report are these: that the settling basins and screens which the New Jersey engineers have submitted are insufficient to remove some of the most obnoxious features of the sewage; that the proposed radiating exits situated on the floor of the harbor and debouching imperfectly filtered sewage cannot fail to affect the deep sea fish in their annual migration upstream. Anyone who has seen the black oil afloat in the water of Newark bay will not have to be persuaded on this point.



Assuming, for the sake of argument, that the New Jersey engineers can do what they say they can, the next point is indisputable. Sanitarians and engineers who have studied the subject agree that the capacity of New York harbor to contain sewage is limited by its unusual situation. The fall of the Hudson river is so gradual that between its estuary and the mouth of the harbor, two tides instead of one continually ebb and flow and in the trough between crests the drift of flotsam within the river and harbor is reversed several times before it is finally carried out to sea. This was well illustrated by the experiment of starting a float on an ebb tide at Spuyten Duyvil. It took forty-two hours to reach Coney Island because its direction was reversed three times by the incoming tide. As with the float, so with the sewage. The prospect is far from attractive.

Oxidation is the process which renders sewage comparatively inoffensive. When raw sewage is poured into pure water containing one hundred per cent of the oxygen for which it has such an avidity, it is innocuous only as long as there is a plentiful margin of oxygen left. Estimates of how much loose oxygen is necessary for fish life differ from fifty to seventy per cent. The Sewerage Commission has conclusively established by experiment that there are places in the waters about New York now where at certain tides there is no loose oxygen whatever.

Why, therefore, should New York city, with its population increasing at the rate of thirty-six per cent in a decade and its own sewage disposal problem increasing in the same proportion, make to New Jersey this more than generous present of the harbor's whole margin of capacity to assimilate waste?

Since the Sewerage Commission submitted its report this summer, the affair has been at a standstill. If the city of New York does not take this opportunity to join with the state in an active campaign to defend her title to her own harbor now, what will her doubled population have to pay for a clean and safe harbor in another generation?

Nor would inertia on the part of the city be merely a costly indulgence at this stage, for the needless extravagance of the sacrifice is apparent when we consider that of the twenty-five municipalities which propose to drain by way of the Passaic Valley system, more than twenty are inland towns. The report of the Metropolitan Sewerage Commission, moreover, goes sufficiently far afield to demonstrate that the expenditure which would build the

A DOWN TOWN SEWER.
Through the holes caused by the fallen brick, the street pavings are visible.

Passaic Valley tunnel out into New York harbor would cover the cost of a similar system, discharging a completely purified residuum into Newark bay.

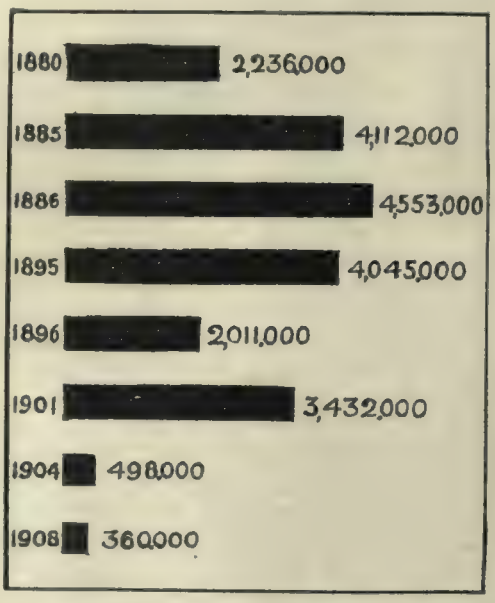
A CONTAMINATED BATH.

A sewer three feet in diameter empties a few feet above it.

The New Jersey project is not the only one which is menacing the harbor waters. Another suit is pending between the United States government, plaintiff, and the state of New York and the Bronx Valley Commission, defendant, apropos of a less tremendous but more imminent peril due to a sewer now in process of construction, destined to carry the waste of White Plains into the Hudson river three hundred feet above the city limits; by the peculiarities of the franchise granted to the Bronx Valley Commission, its processes are exempt from the control of the New York State Health Department.

The outlet of this sewer is planned at forty feet below the surface of the water and five hundred feet from the shore on the theory that the sewage will be diffused at once. No attempt at purification or screening is planned for the project. At Peddock's Island in Boston harbor where a similar system is in operation, the sewage, far from disappearing, rises at once to the surface and is very offensive.

In 1903, when neither the New Jersey nor the Bronx Valley project was an immediate issue, the question of protecting New York harbor against pollution had become so grave that the first commission was appointed to make recommendations for saving the harbor. Let us now consider the magnitude of the problem facing its successor, the present Metropolitan Sewerage Commission, irrespective of imminent future difficulties.



New York has no centralized system of waste piping as have most large European cities. Paris has such a system, but Paris was embarrassed during the flood last winter by a lack of maps. These had been burned with the archives during the commune, and Paris consequently paid a large price for a picturesque episode in her history. New York is now paying indemnity for the unfortunate by-products which have accompanied the growth of her commercial supremacy. In the City Hall a map of the sewers can be found—but such a map: sections of piping torn up and moved around corners to accommodate electric light wires belonging to private companies; conduits for wires let through the center of sewer walls; brick walls collapsing and almost letting the sidewalks in after them! Under every fifth or sixth of the piers which surround Manhattan Island is a sewer of which the mouth, flush with the pierhead or even under it, is out of water at low tide. More careful construction and a gradual slope would have admitted of an exit below the surface at all tides.

Circling the city also and in close proximity to the exits of the sewers are a series of much patronized public baths and the intakes of the high-pressure water system of the Fire Department. The commission has maps showing all three in colors; their proximity makes plain at a glance why the authorities refuse to use the high-pressure water system to clean the streets of the city. These maps also explain why the commission recommends the abolition of the floating baths

and the substitution of baths on shore provided from the regular city water supply. Recent experiments have even proved that contrary to the commonly accepted theory, the amount of salt in the brackish waters surrounding the city has no antiseptic property whatever.

Probably no one can make a just estimate of the relation between these sewers and the death rate. But remembering how many of the hospitals of the city are close to the water's edge, one wonders how large a factor in the mortality tables is due the effect of the night stenches upon sleepless patients. How many baby lives on the East Side are sacrificed each summer to intestinal trouble of which the infection is carried by flies from the floating sewage?

Nor are the silent arguments for a better system of drainage presented by the patrons of public baths and the denizens of the lower East Side alone. They represent all the social strata of the city and bring the question home to the doors of every one of us, up and down town. Oysters are still taken from the now polluted waters within the Narrows and, after being transplanted for a few months in more remote beds, are brought into our markets. The once famous Hudson river shad, are now so redolent of petroleum as to be no longer a delicacy, though we need not distress ourselves about their flavor, as they will soon be a thing of the past. Property owners on both rivers are concerned, and the commercial supremacy of the city, so largely dependent on the efficiency of its quarantine and health departments, must suffer as Boston, Philadelphia, Chicago and Baltimore grapple successfully with the problems of reconstruction on which New York has not yet begun.

NEW YORK'S ANNUAL CATCH OF SHAD.

The Metropolitan Sewerage Commission has spent four years making a painstaking study of the waters about the city. An interesting article by Dr. George A. Soper, chairman of the commission, in THE SURVEY for June 5, 1909, described the methods pursued and the ingenious instruments used in its experiments. The commission has recently made to the mayor an extensive report on its work from which most of the facts in the foregoing article were obtained. It has presented general reconstructive recommendations and will presumably spend the next three years, the extended term of its existence, in making these recommendations specific.

The general scheme is to establish a sewage district embracing about seven hundred square miles in New York and New Jersey, containing a number of collecting sewers leading to local purification works. By a system of sedimentation, the drainage can be reduced to a condition in which it can be carried into the harbor without ill effects. A permanent interstate commission is recommended, to put and keep this policy in operation.

It is probably a disappointment to those who have followed the work of Dr. Soper and his colleagues that they do not bring in a verdict in favor of a vast trunk sewer emptying far beyond the city and the harbor. Once built, such a structure would doubtless solve the problem of

drainage for the five boroughs for many years to come; but certain obstacles of construction would make this solution impracticable unless, like the Egyptians of old, we are willing to sacrifice human lives by the score on the altar of our engineering fame. For the trunk sewer would have to lie many feet below the floor of the harbor at a depth at which workmen could with difficulty live. To be effective, it would have to debouch at least ten miles outside of Sandy Hook. The work of dredging and construction could not be carried on in the open sea without an artificial harbor for the protection of boats and machinery, and it is hardly conceivable that the dirt dredged from the farther points should all be brought back to the New York end. Were the building itself practicable, the cost of such a structure might be enough to deter the city and the state from carrying it out, moreover, and there is no time to waste. The simpler plan, then, of restricting the drainage into the harbor to such as has been screened and at least partly purified by chemicals seems the better one for immediate action. It will safeguard the city from danger at least; and if her heritage of pure waters, with their multiple attendant resources for recreation, do not return to her intact, she must thank the thousand mixed elements of her extravagant growth for that, not blame her commission of hard-working sanitarians.

THE FIRST NATIONAL CONFERENCE OF CATHOLIC CHARITIES

MONSIGNOR WILLIAM J. WHITE
SUPERVISOR OF CATHOLIC CHARITIES, BROOKLYN, N. Y.

With all the pomp with which the Catholic church surrounds the ritual of High Mass and in the presence of the apostolic delegate, Archbishop Diomede Falconio, the first National Conference of Catholic Charities was opened at the Catholic University on Sunday, September 25. It lasted three days and brought together five hundred delegates from every part of the United States. The keynote was sounded by Archbishop Blenk, who preached the conference sermon, when he said: "If God wants us to be charitable, He wants us to be enlightened in our charity, that is charity guided and directed by the light of the intellect; for He is not only the God of love, He is also the God of light."

The need of organization, of system is here set forth and the kindred idea of co-operation with non-Catholic and secular charitable activities is suggested. Indeed, at every session the plea for co-operation with other forces at work in the same field was sounded. The question of whether it would be wise to hold Catholic state conferences was voted down, and the delegates were exhorted to take a more active part in existing state conferences. The fear expressed in some quarters, that a National Conference of Catholic Charities might hurt the attendance of the National Conference of Charities and Correction, is seen to be groundless. Indeed, we may hope for a large attendance of Catholics at the sessions of this important body, as a result of the quickening influence of the conference which has just finished its deliberations at Washington.

When the reports by states were read on the first day it was found that in all the public charitable and correctional institutions of the United States the religious rights of Catholic inmates were respected. No obstacles were placed in the way of the priests who attended these institutions. The American people believe in the "square deal" here as in other departments of life.

Perhaps the most significant session of the conference was the one in which so-

cial reform was discussed and where industrial conditions were blamed for some of the poverty and crime found in large cities. Study and action were recommended and the delegates were exhorted to take an interest in the Consumers' League, the Child Labor Committee, the anti-tuberculosis crusade and other movements for the betterment of the poor. Said one speaker:

> The Catholic Church is the church of the workingman, the church of the common people. If she will continue to receive the loving allegiance of those whose hands are horny with toil, whose brows are wrinkled with care and whose only happiness is in the promise of a life with Jesus Christ through eternity, then we, who have some little knowledge of social conditions and some influence in our respective communities must initiate or take part in movements that have for their object the material well being of the workingman. We must create for them a human environment, the while we teach that "the greatest fact of that environment is man's right relation to God."

This is the platform on which the delegates to the first National Conference of Catholic Charities stand. It includes organization, co-operation, and a war on the causes of poverty whether that cause is a disease germ lurking in a dark corner or a merchant prince grown rich on defrauding laborers of their wages.

On Sunday evening a public meeting of the delegates was held at the New National Theater, at which Cardinal Gibbons presided. Cuno H. Rudolph, president of the Board of Commissioners, welcomed the delegates on behalf of the district. Rt. Rev. Monsignor Shahan, rector of the Catholic University and president of the conference, spoke on the Practical Mission of the Conference. Catholic Ideals in Charity was the theme of Judge M. O'Doherty, judge of the Jefferson Circuit Court of Louisville, Ky., the principal speaker of the evening.

The business part of the conference began at 9.30 on Monday morning in McMahon Hall on the University grounds, with the presentation and discussion of reports on the condition of Catholic Charities in cities, dioceses and states. With an hour's intermission for lunch, which was served in Divinity Hall, the session continued all day, although at four o'clock there were section meetings which were well attended. In the evening there were two general meetings, one in McMahon Hall, where David F. Tilley, president of Particular Council, St. Vincent de Paul Society, and member of the Massachusetts State Board of Charities, read a paper on The State and Private Institutions. Paul Fuller of New York spoke on the Recognition of the Religion of Dependents by the State, and Rev. Dr. J. W. Melody, professor of moral theology in the Catholic University, on the Natural Rights of Dependents. The second general meeting, attended by two hundred women delegates, was held at Trinity College near the university. Rev. P. Mueller-Simoni of Strassburg, Germany, read an excellent paper on the work of the International Association for the Protection of Young Girls, and reports from city committees on dangers to which young girls are exposed were received. This session was the most vital and remarkable held. Social investigators of broad experience, mothers, women physicians and settlement workers spoke with a frankness seldom heard at a public meeting. Low wages, midnight joy rides, lack of parental supervision were enumerated as causes for downfall in large cities. A committee having branches in all the large cities was formed to fight the evil and act in conjunction with the International Association.

The Dependent Family was the subject on Tuesday morning. Robert Biggs of Baltimore, president of Particular Council of the St. Vincent de Paul Society, and member of Municipal Commission for the Prevention of Tuberculosis, read a paper on The Problems Presented by the Dependent Family which created much discussion. He blamed the great industrial forces of the day for much of the existing poverty and pleaded for proper methods in handling the problem. "The man or woman," he said, "who has no other conception of charity work than the mere giving of material relief should stay out of the work or learn new methods. Time and thought and not almsgiving are the real factors that should inspire every worker."

Mount Vernon was visited on Tuesday afternoon. The delegates were the guests of the local committee, of which Judge De Lacy was chairman.

The Church and Social Reform was the topic discussed on Tuesday evening. Monsignor William J. White, diocesan director of charities of Brooklyn, read a paper on The Reform Problems Which the Church Should Meet. Rev. Joseph McSorley, C. S. P., spoke on the Catholic Layman and Social Reform, and The Church and the Social Conscience was the subject of a thoughtful and scholarly paper by Thomas Woodlock, former editor of the *Wall Street Journal*.

After the session on Tuesday evening the committee on organization, of which David F. Tilley of Boston was chairman, made its report on permanent organization.

The conference closed on Wednesday with a session on delinquency. Michael F. Girten, judge of the Municipal Court of Chicago, made the principal address. Judge De Courcy of Boston took issue in his remarks as chairman with some of Lombroso's theories on heredity, and in the discussion following Judge Girten's paper low wages were blamed for some of the crime prevalent in large cities. The suggestion made by Judge Girten, "that the merchant prince who pays criminally low wages with one hand, while making large public subscriptions with the other, be boycotted and that a ban be placed on underpaid labor," was received with enthusiastic applause. The delegates ended the session by singing the *Te Deum* and America. At 2.30 the same afternoon they were received at the White House by President Taft, who spoke of the great charity work done by Catholics in the United States.

That the conference was a success beyond the expectation of the committee who had called the delegates together was evident at the first session. The section meetings, where a large number of papers which were read only by title were discussed, proved to be the most important feature. Indeed, there was a greater variety of opinion and frankness in divergent views than is generally found at state or national conferences. The reason is evident. In these latter assemblies there is always the fear that frank criticism may be misinterpreted and the religious sensibilities of others hurt. In a Catholic conference no such fear is present and boarding-out, placing-out, and the institutional system of caring for children were championed by workers who did not hesitate to point out the defects in other systems.

The section meeting in which Tuberculosis Among the Poor was considered by Dr. Lawrence F. Flick of Philadelphia was well attended, as was the meeting on probation. Other papers discussed at section meetings were: Social Settlements by Grace O'Brien of Catholic Settlement Association, Brooklyn; Schools of Philanthropy by Mrs. P. J. Toomey of St. Louis, and Legal Aid for the Poor by Bernard Fox of Cincinnati.

The following officers were chosen for the next conference which will be held at Washington in September, 1912:

Honorary president, Cardinal Gibbons; president, Monsignor T. J. Shahan, rector of Catholic University; treasurer, Judge W. H. DeLacy of the District of Columbia; secretary, Dr. W. J. Kerby of Catholic University; vice-presidents, Judge C. A. DeCourcy, Boston, Mass., Mrs. T. Hughes Kelly, New York; J. F. Kennedy, Chicago; John H. Grehan, New Orleans; C. C. Desmond, Los Angeles, Cal.; John C. Hagen, Richmond, Va.

The executive committee, which will have charge of the second conference is made up of the following:

D. F. Tilley, Boston, Mass.; E. A. Waldo, New Orleans; J. A. Flaherty, Philadelphia, Pa.; Rev. P. H. Boyle, Little Rock, Ark.; D. B. Murphy, Rochester, N. Y.; Richard Crane, Cincinnati O.; Rev. John A. Ryan, St. Paul, Minn.; Mrs. John MacMahon of Chicago, Ill.; Mrs. J. M. Molamphy of Pittsburgh, Pa.; Dr. John Wingartner of Wheeling, W. Va.; Lawrence Conner of Dubuque, Ia.; Mrs. Thomas Taylor of Austin, Texas.; Paul Carpenter of Milwaukee, Wis.; Edmond J. Butler of New York

WAGES, HOURS AND SPEED IN THE MISSOURI BOOT AND SHOE FACTORIES

In Missouri the rapidly growing boot and shoe industry already leads all others in the total value of production and in the number of employes. For this reason the St. Louis Social Service Conference, desiring a knowledge of facts concerning Missouri industries and their relation to many social questions, selected this industry for its first study. Last winter and spring an extensive yet very incomplete investigation of working conditions in the shoe factories was made. In presenting the following résumé of the most salient points of the report, it is well to state that the statistics are so incomplete and unrelated to numerous other factors, that present tentative interpretations and deductions, no matter by whom made, may, from the light of future inquiry, be proven unwarranted and impertinent.

All of the figures used were given to the conference's visitor by factory superintendents or are taken direct from the Red Book for 1908-1909, issued by the State Bureau of Labor Statistics. It is regrettable that no statistical material was obtained from shoe operators, and this lack forms one of the many elements of incompleteness in the report.

During 1908-09 there were in St. Louis twenty-six shoe factories. The conference's representative sought to gather information regarding capital invested, dividends, yearly output, number of men, women and children employed, wages, health of employes, sanitary conditions and the like. It has been sought to supplement the information gathered by personal investigation and to compare it with the labor bureau reports. Much of the information particularly desired could not be secured, as often one or more factories would give certain material which another or others would withhold—thus spoiling averages and summaries. Practically no statement could be procured on dividends, and the report is vague and meager with regard to sanitary conditions.

The employers have given annual and daily average, maximum and minimum output; hours and wages per day and per pair, price and how many pairs in a case; number of employes (men, women and children under sixteen) and the various kinds of employment (with totals) such as cutters, skivers, stitchers, vampers, etc., etc., in each factory. Incomplete figures were procured on number of days working, not working, time, part time, and overtime. The figures on the average age of men, women and children employes, and average time at trade are also unsatisfactory. Though the effort was made, no figures whatever were got on average time off for sickness or other reasons.

From the 1908-09 Red Book it is found that there were fifty-one Missouri shoe factories—twenty-six in St. Louis, the remaining twenty-five scattered through the state. Of these twenty-five, four were in the penitentiary, eight in cities of less than 5,000, and six, called "rural factories," are in towns of such inconsiderable size that they are listed by the county they are in. Parenthetically, the reader's attention is called to the fact that in Missouri towns under 5,000 in population are exempt from factory inspection,—including of course the enforcement of child labor laws.

During 1908 the average annual wage of an employe,—man and woman, boy and girl,—in city, town, and country, in any Missouri factory was $460, or $9.58 a week, counting forty-eight weeks to the year. Almost a dollar a week less than this is $8.67, the average wage in the fifty-one Missouri shoe factories. The average weekly wage in the twenty-six St. Louis shoe factories was $9.58; in the twenty-five out of St. Louis, only $6.67; and from this it drops to $5.28 for the six rural factories, and to $3.91 a week or $188 a year for the average rate for a convict's labor in the penitentiary. Take a glance back over these figures to secure their order: peni-

tentiary rate, lowest; rural factories, next; small towns; cities. And, though the city wage is largest, even it is very small—$9.58 a week, $459.81 a year.

This yearly average of $459.81 paid in the St. Louis shoe factories falls $100.19 below the $560 estimated by the ten district workers of the Charity Organization Society of Buffalo as the "lowest tolerable budget without charity for a man, wife, and three children from eight to fourteen years of age."[1] Fortunately it is not necessary to consider the three children between eight and fourteen years old in reckoning a budget for shoe workers in St. Louis. Most of the men leave the shoe factories before their children get that old.

The average age of the male employe in four factories reporting is twenty-eight years. It is uncommon to find a male operator over thirty-eight and almost impossible to find one of forty-five. What becomes of them, a future study must determine. This is too vital a question to leave unanswered.

In all figures given, the weekly wage has been based on forty-eight working weeks a year. Estimates on this basis are uncertain, for full data could not be had on the average amount of lost time for each employe. For the same reason the average daily wage is no criterion of weekly or yearly earnings. Thus, in six factories reporting the average daily wage for women is found to be $1.77; for men, $2.43. Cutters, among the most skilled workers, average $3.75 a day. For several shoe trade employments in the St. Louis factories the Red Book lists a weekly wage of $2.50. In all employments except lasting a ten-hour day, fifty-nine-hour week, obtains. Lasters have a nine-hour day.

The investigation figures on speed are incomplete and very technical. Some general idea may be gained, however, from the report on eyeletters. Average daily wage, $1.64; output daily, 1-2000 pairs. In one factory, a woman eyeletter ranges daily from 125-150 cases of twenty-four pairs a case. She receives two cents a case. To make three dollars she handles 7,200 shoes.

Related to all this statistical material are such statements as: "The increase in child labor was not due to stringency, the increased cost of living, or to the poorer condition of the masses, but, instead, to an increased demand for those workers from the new canneries and shoe factories,"[2] and: "The city of St. Louis was originally the boot and shoe center, as far as Missouri goes, but, in the last three or four years, this industry has spread out into the state and now every town of any size has a factory."[3] Again it is pointed out that factory inspection extends only to towns of 5,000 and over.

Recent St. Louis newspaper items say that the number of factories in St. Louis has decreased during 1909-1910, but that there has been a great increase in the outlying districts.

The boot and shoe workers are but weakly unionized. Since losing a big St. Louis strike in 1907, the union has never regained its strength. St. Louis union men have told investigators that one great difficulty in the way of organizing there is the general feeling among city workers that, in case of a strike, shoe workers from the country factories would be brought in as strikebreakers.

From this report the most distinct impression that the conference received was that, in the light of this incomplete investigation, the wage paid in all shoe factories in the state, whether in city, town, country, or penitentiary, seems very low. The low scale, it believes, is due to the lowest wages paid, *i. e.*, in penitentiary and rural factories. The remedies nearest at hand are: first, the abolition of the penitentiary contract system of labor; second, the extension of factory inspection throughout the state; and third, the regulation of the hours of employment of women.

THE TREND OF THINGS

A bird's eye view of social and industrial conditions and covering seven counties in south central Pennsylvania appears in a pamphlet outline entitled a Survey of Huntingdon Presbytery, by G. B. St. John, recently issued by the Department of Immigration of the Board of Foreign Missions of the Presbyterian Church. The district covers about one-eighth of the state, and has a population of 321,939, of whom about one-fifth are foreigners.

Five counties are agricultural and in these Mr. St. John finds that the American farmers have within the last generation been displaced by Germans. The Americans seem to have migrated to the cities, some finding work among the 15,000 employes of the Pennsylvania Railroad shops at Altoona, or the 5,000 employed by the Logan Steel Works at Burnham, in Mifflin county. Juniata county has shown a decrease within the last forty years. The other agricultural districts have increased during that time, but three have begun to fall off of late.

The principal industrial counties are Blair and Clearfield, whose mines, quarries and brick yards have drawn such numbers that population has almost trebled in forty years. Throughout the presbytery neglect of the more recent immigrants, Slavs and Italians, is evident and in these two densely settled counties the problem of the immigrant is most acute.

Of the two races, the Italian is the more transient, moving as the centers of quarrying and brickmaking change. The Slav settles permanently around the coal mines, from which his willingness to accept a low standard of working conditions drove his American and Irish competitors. It is interesting to note, however, that at the present time the Slav miners are for the most part organized, and the most recent element that has come into the mines to lower conditions is the non-union American farm laborer, willing to work for almost anything during the slack season on the farm. The union miners have an eight-hour day and can earn four to four and a half dollars a day. But many of the mines are shut down during several months in the year and weekly earnings frequently average only between five and ten dollars throughout the year. With such an income life can give only the satisfaction of the barest necessities. The standard of living is further lowered by miserable housing in hideous company houses of the roughest wooden construction, built on piles and often so badly as to let in rain and snow. In many of these there is no water supply and pails must be carried in summer five or six blocks, and filled in winter by melting snow. The spiritual opportunities offered the workers are of the same grade—a district school whose curriculum is not adapted to the needs of the pupils, and is under the direction of a young and inexperienced teacher. There is no church nor any other center of social life, no organized recreation nor club for young or old. It is not surprising, under such circumstances, that drunkenness is common. "There is nothing else for the miners to do," says one mine superintendent.

With such material and such spiritual opportunities Mr. St. John fears that we are in danger of developing in these communities a permanent peasant class, incapable of adapting itself to American civilization. There is some encouragement, however, in the fact that in spite of social neglect, the Slavic immigrant, the hardiest and most ambitious of his race, is hard-working and thrifty; the police records show that few commit crimes more serious than drunkenness and disorderly conduct and their children are, according to school records, intelligent and eager to learn. There is a ray of encouragement, too, in the fact that everywhere among both Slavs and Italians, Mr. St. John found a growing unrest and discontent with their position in the social system.

In a district like Huntington Presbytery, of thinly settled farms and small, densely populated industrial centers, there is only one agency for social improvement and that is the church, which, too, in such districts more than in cities, is recognized as any agency for social as well as individual regeneration. A federation of all churches, Mr. St. John believes, strengthened within the Presbyterian Church by a special superintendent of social work and a committee on foreign speaking people, should not only bring religion to the foreigners, but should try in all but the largest cities, to secure better housing, better education and better recreation,—should, that is, absorb the functions of all those social agencies which are not practicable in a district like Huntington Presbytery.

* * *

Chicago's health department bulletin, whose "healthgrams" have been so widely quoted, took occasion during the first week of the school year to print some "schoolgrams":

"Let the first lesson be: How to keep well.

"You'll be brighter, learn more and keep in better health if your teacher will keep the windows of the school room open. Bad air makes a sluggish brain.

"'Do unto others as you would have others do unto you'—meaning: Don't carry disease germs to school and cause sickness and perhaps death among your playmates. If you have a contagious disease at home keep entirely away from all other children. Stay at home if you have a sore throat.

"'Skidoo' from the boy or girl with 'a little sore throat.'

"A 'little sore throat' in one little child may cause a big lot of trouble for many other children. Many 'little sore throats' are in reality diphtheria.

"Wash the drinking cup thoroughly before putting it to your mouth. The child who used it just before you may have left the germs of disease on it. Wash the germs off.

"Keep that pencil out of your mouth—it may have scarlet fever, diphtheria or typhoid fever germs on it.

"Swapping gum, swapping apples and swapping candy are about the dirtiest things—and the most dangerous things—that a child can do. Don't be that dirty.

"Keep your hands clean. Soap is your good friend; dirt is your worst enemy.

"Eat very little candy, treat your stomach well and you'll live longer.

"Never buy candy or fruit at an open stand on the street. Flies have left all kinds of dirt on it and dirt from the streets has been blown upon it.

"When you play, play out of doors—but never play in dusty places.

"Don't run to school—especially just after eating. Start in time so that you will not have to run.

"Be well and you'll be happy—even in school."

* * *

The Massachusetts Civic League has outlined a plan for a better housing campaign throughout the state. E. T. Hartman, secretary of the league, declares that "there is probably no town in Massachusetts, surely no city, that has not some bad housing conditions, whose growth should be stopped by persistent work along certain known and consistent lines." In the work of improving conditions the league offers to send representatives to advise and co-operate with local groups. The plan proposed covers the enactment of laws which will make it impossible in the future to construct houses inadequately lighted or ventilated, the ascertaining and improving of laws providing for the proper maintenance and use of buildings already constructed, the educating of the tenant in his responsibilities, of the public in its rights in regard to sanitary conditions in housing, and of the landlord to the financial value of property well kept up.

* * *

In the early spring of 1909 the Charity Organization Society of New York city relinquished its mendicancy department and the National Association for the Prevention of Mendicancy and Charitable Imposture was formed, with James Forbes as secretary and director. The objects of the association are "to investigate throughout the United States the causes and effects of homelessness, vagrancy, begging, imposture and fraudulent appeals and to create and apply methods of prevention, and to assist blind, crippled and indigent persons to secure employment or . . . in other ways seek the advancement of their interests." The first annual report of the association shows the work of the mendicancy police taken up at the point where it was dropped when these police were discontinued. Many "old timers", who had been forced off the streets and either furnished with work or put in the care of relatives, were found to be back on the streets. In dealing with these and with new cases many difficulties were found in the association's first year, among them the "political pull" of some of the meanest and most inexcusable mendicants, the softheartedness of magistrates and the lack of sufficient funds to do the association's work effectively. But the most important was the lack of willingness on the part of individuals or societies to take care of those old persons or cripples who ought not to be expected to work and who have an unconquerable dread of institutional life. This shrinking should be respected, the society feels, and their needs should be met by adequate pensions. A number of typical cases are quoted in the report, the majority of which show some physical handicap, which made self-support practically impossible, as the fundamental cause of mendicancy, imposture or fraudulent appeal. Probably only a small number of cases can be dealt with by the police alone, the furnishing of relief or suitable work being far the most important and difficult side of the problem. The work of the association has this year been limited to New York city, but the co-operation, financial and otherwise, of some thirty charity organization societies in other cities has been secured, and it is expected that, with adequate financial assistance, the scope of the work will gradually expand. The annual report shows seventy-two persons arrested, seven furnished with employment, four aided with transportation and 287 with advice and in some cases money. The society has records of almost 9,000 mendicants, including photographs and finger prints—a mass of information which should be invaluable to charitable institutions and individuals throughout the country. To render effective national service it is glad to enter into co-operation with charity organizations throughout the country and desires correspondence toward this end.

* * *

The National Society for the Promotion of Industrial Education, 20 West Forty-fourth street, New York city, has issued its Bulletin No. 11, which is A Descriptive List of Trade and Industrial Schools in the United States. The materials for this catalog have been compiled by Edward H. Reisner, the secretary of the society. The contents fall into eight divisions, the most important of which are those on Intermediate Industrial Schools, Trade Schools (Day Courses), Technical Schools (Day Courses), Apprentice Schools and Evening Schools giving (a) Technical and (b) Practical Shop Courses.

The pamphlet was published as a result of a general demand for a tabulation of the main facts and features of the administration and curricula of the industrial and trade schools at present in operation in this country. As a majority of the existing intermediate industrial schools have been inaugurated within a period of two years, the facts relating to this section are of particular interest to those concerned with modern educational movements.

COMMUNICATIONS

ARE CHARITABLE SOCIETIES RUDE?

To the Editor:

To the admirable advice on page 841 of THE SURVEY on the press, let me add: Be ordinarily polite to a reporter.

My experience as a reporter was that the rudest places I went to, short of people in society, were the charitable offices. I still sting with the memory of the way I was treated in two or three—two I distinctly remember, but will not name, offices of large societies in New York in the seventies—when I visited them, as a reporter.

Mrs. Josephine Shaw Lowell was a model in the way she treated a reporter. I still reverence the memory of ten minutes with that saintly and sainted woman. Note, it is easier to be sainted than saintly. My own personal experience is that until you are known, and sometimes after that, the manners of charitable societies are bad. The officials deal so much with cheats, impostors, and dependents, that they begin by treating all the unknown as in one of these three classes. The sergeant at the desk in the police station comes to have the same manner, only worse.

TALCOTT WILLIAMS.

Philadelphia, Pa.

THE PAGE BILL

TO THE EDITOR:

There is a statement on page 869 of your issue of September 17, from one of your female correspondents which ought not to go unrebuked. She says "that when a man and woman have all the children our present economic conditions permit them to bring up decently"—which would seem to imply that the bringing of children into the world should be governed entirely by questions of economy and prudence—"for that man and that woman the use of the sex function should cease." For one to assume that position is to teach contrary to the entire consensus of the Christian Church and of the Sacred Scriptures. The marriage office of the English Prayer Book says that holy matrimony was ordained not only for the procreation of children, but also "as a remedy against sin . . . that such persons as have not the gift of continency might marry and keep themselves undefiled," and for "mutual society,—help and comfort."

St. Paul says it is better to marry than to be consumed with desire, and directs married people not "to defraud one the other except it be with consent and that for a time." As a married man I resent the terms of "prostitution" and "lust" being applied to the natural relationship of a man and his wife. "Lust" means desire for a physical gratification irrespective of affection for, or against the will of, the object. There may be of course married men who are brutal and inconsiderate to their wives, but as a teacher of morals I utterly deny the position of your—I presume maiden—correspondent that all marital intercourse except for the purpose of producing children is wrong.

JOTTINGS

Annual Meeting of the New York Charity Organization Society.—The New York Charity Organization Society will hold its annual meeting in room 306 of the United Charities Building, 105 East 22nd street, New York, on Wednesday, October 12, at a quarter past three o'clock.

CALENDAR OF CONFERENCES

NATIONAL.

National Conference of Charities and Correction. June, 1911. Boston, Mass. Secretary, Alexander Johnson, Fort Wayne, Ind.

STATE.

Maine Conference of Charities and Correction. October 26-29, 1910. Portland. Secretary, Francis H. Hiller, Portland.

Massachusetts Conference of Charities. October 26-28, 1910. Fitchburg. Secretary, Parker B. Field, 279 Tremont street, Boston.

Pennsylvania Association of Directors of the Poor and Charities. October 11-13, 1910. Willliamsport. Secretary, Louis C. Colborn, Somerset.

Minnesota Conference of Charities and Correction. November, 1910. Crookston. Secretary, E. T. Lies, City and County Building. Minneapolis.

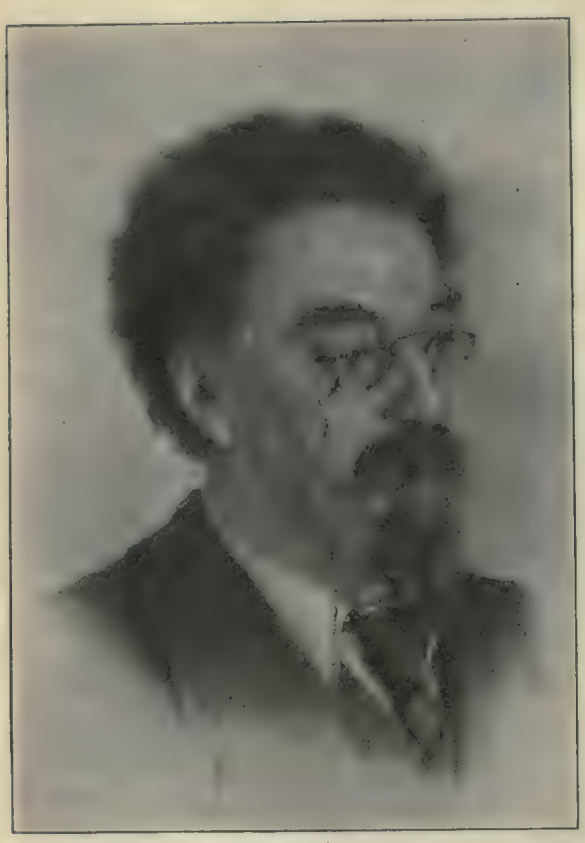
New York Conference of Charities and Correction. November 15-17, 1910. Rochester. Secretary, Frank E. Wade, 1106 D. S. Morgan Building, Buffalo.

South Carolina Conference of Charities and Correction. December 8-9, 1910. Florence. President, A. T. Jamison, Connie Maxwell Orphanage, Greenwood.

Connecticut Conference of Charities and Correction. March or April, 1911. New Haven. Secretary, Charles P. Kellogg, Waterbury.

New Jersey Conference of Charities and Correction. March, 1911. Princeton. Secretary, J. Byron Deacon, 417 Roger Williams Building, Philadelphia, Pa.

THE COMMON WELFARE



PRISON CONGRESS GOES TO LONDON

The International Prison Congress in session last week in Washington adjourned with the selection of London as the meeting place for 1915 and Sir Evelyn Ruggles-Brise as president of the International Commission to succeed Prof. Charles R. Henderson of the University of Chicago. The new president is chairman of the British Prison Commission and has been a leading delegate to the congresses since that of Paris in 1895. The 1915 meeting will bring the congress back to the city of its first meeting place and afford a remarkable opportunity for reviewing the advances since the initial congress of 1872.

The American meeting this year, however, brought the international body to the country of its inspiration and many were the tributes paid to its founder, E. C. Wines. It is more than appropriate, therefore, that this year's congress brought with it an unequivocal declaration on the part of a majority of the delegates in favor of the scientific principle of the indeterminate sentence, that is, of reformation as the basis for treating offenders. Here, as at no previous congress, a more complete understanding was reached as to the exact meaning of principles and practice, removing many of the tenacious conflicts of ideas. While the Washington meeting thus carried with it a worldwide recognition of those newer and more humanitarian concepts for which prison reformers and reformatory managers in America have long stood, the trip throughout the country and the incidental discussions at Washington brought out with equal clearness the utter and bitter inconsistency embodied in the treatment of men, women, and children in the local prisons and jails of the United States. In his closing address, the president-elect voiced both the appreciation of the foreign delegates of the hospitality shown them and the indebtedness of the Old World to the New for its demonstrations of modern treatment of the delinquent; but he linked with these things a ringing appeal to America to root out the entrenched evils of the locally administered jails and workhouses.

The different sections of the conference met under the chairmanships of Adolphe Prins of Belgium, Prof. Dr. J. Simon van der Aa of Holland, Sir Evelyn Ruggles-Brise, and Dr. Katharine B. Davis of New York state. The appointment of the superintendent of Bedford Reformatory was a recognition of the part which American women have played in the field of prison reform. A general review of the congress will be published in the November magazine number of THE SURVEY, coupled with several of the leading papers, a series of sketches of the foreign delegates, a review of the American trip by one of the latter, and a presentation by a member of the Chinese party of the significance of the group of Oriental jurists and prison administrators in attendance at the International Congress.

In brief, the resolutions under the section on criminal law, approved the scientific principle of the indeterminate sentence and defined the make-up of parole boards which should give it application; they provided that crimes and misdemeanors of which a person is guilty in one country should be recognized with reference to establishing recidivism in other countries. Under the section on prison administration, the essential principles on which the reformatory method is based were defined, short term sentences deprecated, and the joint confinement of prisoners waiting trial and those serving short sentences condemned. The resolutions defined the terms on which conditional liberation and parole should be carried out, and distinguished between probation and parole; they held that all penal institutions, including houses of

SIDNEY WEBB.

detention and jails, should be under the control of a central authority, that all prisoners should be employed at useful labor, and that local jails and houses of detention should, so far as possible, be used solely for prisoners awaiting trial. Under the third section on prevention, the resolutions held that the state should allow payment to prisoners and that this money should be available for the assistance of their families if needed. They affirmed the uselessness of repeated short sentences for inebriety and the practical success of special establishments for the detention for long periods of habitual criminal drunkards. They favored workhouses for professional mendicants and vagrants, and advocated agricultural and industrial training and medical supervision in connection with the same; also the extension or establishment of a system of identification or classification of such offenders. The section held that it is desirable to introduce and extend laws providing for probation and to provide some central authority which will exercise general supervision over the work. The effects of suspended sentence without probational oversight are difficult if not impossible to ascertain.

Under the fourth section, dealing with children, a strong series of resolutions were drawn up declaring that young delinquents should not be subjected to the penal procedure now applied to adults, and defining the principles of probationary control with respect to them. The section held that legislative measures and moral and social propaganda are necessary for the protection of illegitimate children, declaring incidentally but strongly for a single moral standard applicable to men and women alike. It supported laws for making parents responsible for the wrongdoing of their children.

By action of the International Prison Commission, Councillor Jules Bickl de Bellye, chief of the Hungarian prison system, who was president of the Budapest congress of 1905, and Z. R. Brockway of Elmira were honorary presidents of the Washington congress. Appropriate recognition was made of the services both to prison reform and to the congress of the late Samuel June Barrows, who had been elected president of the International Commission at Budapest. At the close of the sessions, Dr. Guillaume, secretary of the congress, now in his eighty-fourth year, was made honorary president and Professor van der Aa was elected to the secretaryship so long and honorably filled by Dr. Guillaume.

DISEASE OF DESTITUTION

Word reaches us from England of the first general meeting, held at Llanbedr, Wales, by the National Committee

for the Prevention of Destitution, organized to obtain legislation which would revolutionize the treatment of poverty in the British Isles. The reports of the Royal Commission to Investigate the Poor Law were submitted in the early part of 1909 and an outline of the report of the majority of the commissioners was given in THE SURVEY of April 3, 1909;[1] of the proposals of the minority for dealing with unemployment in THE SURVEY of April 17, 1909.[2]

The object of both majority and minority is the substitution of prevention for relief, and the method of prevention of poverty through unemployment, urged by both, has many points in common, though the minority plan is broader in scope and national instead of local in administration.

The development bill of the fall of 1909, by which certain public works were to be undertaken and work on them was to be arranged to fill in periods of slack work in the business world, and the Labor Exchanges opened last February, were a partial response, if not directly to the recommendations of the reports, at any rate to the public demand for regularizing employment which found one channel of expression through the reports. Only one-tenth, however, of those persons coming to the poor law authorities were found by the commissioners to be able-bodied. Nine-tenths were children, the sick in mind or body, old persons, or widows with little children. For these classes, with the exception of pensions for the old—and these do not, by the way, include those old persons who are being cared for by the poor law authorities—no action has been taken by Parliament on either majority or minority report. So far as can be ascertained the majority are not pressing for legislation; the minority, consisting of Mrs. Sidney Webb, George Lansbury, Rev. Russell Wakefield and F. Chandler, have spread their propaganda of the abolition of destitution—no small contract—so widely that it will be quite worth while to consider their propositions for dealing with the nine-tenths who should rightly be dependents.

Already, though less than a year old, the National Committee for the Prevention of Destitution numbers 30,000 and its organizers travel all over the country lecturing and forming local groups. In April a prevention of destitution bill was presented in Parliament; one week-long meeting to push the bill has been held and a monster mass meeting is planned to be held in London at Whitsuntide.

Both majority and minority agree that the mixed workhouse is an un-mixed evil. The substantial disagreement between the two is that whereas the majority would, where indoor care is needed,

BEATRICE WEBB.

[1] C. L. Loch, English Royal Commission on Poor Law and Relief of Distress.
[2] John Martin, A Remedy for Unemployment.

split the workhouse up into about half a dozen institutions—hospitals and asylums—designed for the different classes of dependents but run by an improved poor law authority, the minority would put dependents of these classes into institutions coming under the Public Health, Education or other boards. The minority believe, that is, that duplication of authorities should be avoided and that the functions of poor law authorities should be simply to connect the dependent with existing institutions.

More important still, the minority would give institutional care only to those for whom outdoor care could not possibly be provided.

Even more radical is the difference in outdoor care suggested by the two groups. The majority would continue, but greatly improve, the present method of giving outdoor relief by special officials. The minority, true to their principle of avoiding a duplication of agencies brought to bear on any individual, would put children entirely in the care of the education authorities, which now, as they point out, not only teach but frequently partially feed, clothe and give them medical care. The aged they would bring under the pension office and the sick under the health departments. To the functions already belonging to these bodies they would add the power to search out destitution and prevent it in its incipient stages instead, as under the present system, of allowing the disease of destitution to gain such ground that the "patient" is a hopeless pauper before he comes to the notice of the authorities. Having sought out the case before it was incurable, the authority dealing with that individual should have the power either to compel adequate support from the responsible person—and in this the Labor Exchange would help—to pension those suitable for pensions or give whatever other care was necessary. In the case of the sick or feeble-minded, the health authorities should have power to treat at home or forcibly to remove, as the case demanded, and would make it its special business to take in time and enforce treatment of industrial diseases, such as tuberculosis, lead poisoning, varicose veins, and hernia. It is with something of a shock that we learn that this system of medical assistance, though it would be as universal and as compulsory as the public school system, is not to be free. On the other hand both majority and minority have advanced ideas in regard to the care of widows with young children, both urging that their complete support should legitimately fall on the community and that childhood should be extended to the age of fifteen.

As in the case of unemployment, however, the minority scheme of pensions is broader in scope than that of the majority. The former believe that all old persons and widows of the wage-earning class should be eligible to receive support from the government; the latter that pensions should be given at the discretion of those administering poor relief.

At the recent meeting in Wales the problem of unemployment was discussed by Sidney Webb, Prof. Stanley Jevons and Prof. Thomas Jones; of neglected childhood by Clifford Sharp, and several sessions were devoted to the details of administration of the proposed system in Scotland and Wales. Of greatest interest to the visiting philanthropist was the general analysis of the minority method of abolishing destitution given by Beatrice Webb, and the discussion of objections to the prevention of destitution bill by George Lansbury of the London County Council.

The "breaking-up" of the poor law planned by the supporters of the prevention of destitution bill means more than simply changing the system of relief from the old punitive method of dealing with pauperism while leaving the causes of destitution unchecked. It means also not segregating the pauper victims of prolonged destitution, but bringing them under the same treatment with those in the initial stages of destitution. By searching out the latter class and treating them through recognized institutions, which already come into intimate contact with their lives and which are not associated with the reproach of pauperism, the minority believe that that social dis-

case which produces a pauper class can ultimately be eliminated. The preventive idea in dealing with poverty is recognized by what Sidney Webb calls the "New York philanthropy" in far greater degree than by that "London philanthropy" which framed the majority report, but the New York school has not so fully as the minority worked out a plan of stopping destitution in the bud through the agency of public education and public health bodies, and it will be sometime before this school accepts the idea of any very wide system of government pensions.

CLASSES IN ENGLISH FOR IMMIGRANTS

Night classes to teach foreigners English have been conducted by the boards of education in many large cities throughout the country. Thus far, however, the smaller places have failed to provide similarly for immigrants who settle in them and whose conditions frequently involve handicaps quite as serious as those to be found in the larger cities. Foreign laborers who are unable to speak English find it even more difficult in small towns than in larger cities to become acquainted with work and other opportunities elsewhere. An excellent example has been set by Mt. Kisco, a small village of two or three thousand people, about forty miles from New York, where the Board of Education has decided to start a night school for foreigners, most of them Italians between twenty and twenty-seven years of age. The school is to have two sessions a week through the winter, beginning October 10, and already some forty-five men are on the register. The principal of the day school is to supervise the work without extra salary, and C. M. Wood, whose interest in the Italians of the village started the movement for the night school, volunteers her services for the beginners.

The far reaching importance of a knowledge of English on the part of immigrants is strikingly brought out in a letter recently addressed by the manager of the Labor Information Office for Italians of New York city, G. E. di Palma Castiglione, to the New York City Commission on Congestion of Population. He makes the radical suggestion that there should be compulsory teaching of English to all adult residents of New York, who cannot prove that they know the language. He urges that this would help lessen congestion, for the immigrant who knows English is not only able to learn of opportunities in other places, but is less hesitant to go where he may not be surrounded by people who speak his native language. While present facilities and means are not adequate to provide this teaching of English, even if it were required by law, it is most desirable that provision be made for it. Another suggestion of the Labor Information Office for Italians, that public authorities regulate the business of taking boarders or lodgers, likewise points out a thing that urgently needs to be done. It must be recognized, however, that there would be difficulty in securing the money and machinery to enforce such a law even if it could be enacted.

INDUSTRIAL COMPENSATION AT CHENEY SILK MILLS

Cheney Brothers, silk manufacturers of Manchester, Conn., who have for some years maintained a non-contributory pension system for long service as well as a mutual tuberculosis benefit association, have this summer improved and extended their benefit association to cover sickess and accident, annuities and death benefits. Though the firm bears the full expense of work-accident and death payments, only members of the general association who pay two per cent of their wages toward sickness and death from disease payments and annuities payable after a certain age and term of service, are eligible to compensation for industrial accident. The compensation is therefore tied up with a contributory system, and in so far is inferior to the Harvester and Steel Corporation plans, which apply to all employes on a really non-contributory basis. The system in the Cheney mills is a pure compensatory

scheme, throwing the burden of the accident on the industry, except in cases of culpable negligence on the part of the workmen. The amount of the benefits stands midway between the other two plans, the death benefit being three years' wages and moderate funeral expenses; total incapacity, for which payment begins after three days, half pay for a maximum of six years; partial incapacity half the difference between pay received before and after the accident—the payment, that is, is based not on the nature of the injury but on the amount to which it handicaps the worker. All payments are increased one per cent for each year's service beyond five years, and five per cent for each child under sixteen, but no increase can exceed twenty-five per cent. All medical and surgical expenses are paid.

The total contributions of employes, increased by a twenty-five per cent contribution from the firm, are used for the sickness and annuity fund. Only the proportion of the employe's contribution which would be used on his annuity is recoverable if he leaves the firm. In case of death the annuity contribution, with four per cent interest, is paid to the defendants of the deceased; in case of the marriage of a woman employe the same amount is paid to her as dowry. The sickness benefit is one-half pay for fifty-two weeks and one-quarter for a further period of the same length. In cases of confinement the firm requires a woman belonging to the benefit association to stay away fourteen weeks at least, eight of which are to be before her baby is born.

In consequence of the fact that all work-accident payments, all running expenses and all risks are paid by the firm, Cheney Brothers reserve the right to appoint the treasurer and a majority of the board of trustees.

LARGE ENROLLMENT IN BOSTON SCHOOL

The School for Social Workers, maintained in Boston by Simmons College and Harvard University, has opened its seventh year with sixty-two students, the largest enrollment as yet. One-half of them are giving all their working time through the year to the course. Twelve are doing three-fifths of the full work, nearly all of whom expect to complete the course next year. The others, persons already at work or holding fellowships in research, attend two mornings a week through the year. There are ten men, three of them fellows in research. Of the total, eighteen hold degrees of a college or professional school and four are graduate nurses.

The program has been enriched by the addition of a course on physiology by Professor Stiles and a course on psychology by Dr. Dewing, both of Simmons College. An elementary knowledge of those subjects and of economics is now required of all candidates for the school certificate. The offices of the school have been enlarged. The classroom is practically filled. There has been a marked increase in the number of former students who are now holding positions in social service in and about Boston; notably in public offices, through the civil service. In the research work there are nine assistants and fellows. The executive staff of the school remains unchanged, Jeffrey R. Brackett, director; Zilpha D. Smith, associate; and Theodore W. Glocker, assistant.

PHILADELPHIA PUBLIC PLAYGROUNDS COMMITTEE

Philadelphia, which has lagged behind, is planning a comprehensive system for public recreation. Last July Councils appropriated $121,900 to the newly appointed Public Playgrounds Committee under a unique plan by which the committee is to create municipal baths as well as playgrounds and recreation centers. For the present, the existing public baths maintained by the Bureau of City Property and the playgrounds managed by the Board of Public Education and those under the commissioners of Fairmount Park, are not to be in the control of the new committee. After the committee has organized the necessary ad-

ministrative machinery, some or all of these may be transferred to its jurisdiction.

The members of the committee serve without pay. The sum of $25,000 has been set aside for stationery, clerical force, supervision and salaries of teachers. The balance, $96,900, is for the development of playgrounds, completing the improvement of Starr Garden, and for general maintenance.

Although the school authorities have had vacation playgrounds, effective interest in municipal recreation centers really began with the formation of the Philadelphia Playgrounds Association three years ago. City officials at first favored playgrounds mainly as an easy bid for popular approval. Later a number of them studied playgrounds in other cities. The journey had good results, and Councils are no longer inclined to vote money for playgrounds under conditions making its use impossible. This change has been due largely to the persistence of Otto T. Mallery.

Several sites have been given to the city for playgrounds as a result of the interest awakened. The first to be developed will be Starr Garden, a small park with meager playground apparatus, which has long belonged to the city but has been privately supported.

The committee appointed to supervise playgrounds consists of:

James R. C. McAllister, chairman, also chairman of finance committee of Councils; Mayor John E. Reyburn, Alfred S. Eisenhower, chief of the Bureau of City Property; Joseph S. Neff, director of the Department of Public Health and Charities; William H. Staake, judge of Court of Common Pleas No. 2; William A. Stecher, director of physical education of the Board of Education; John W. F. Carson and Otto T. Mallery, secretary.

These gentlemen were all interested in the work of the playgrounds association. W. D. Champlin, who served as assistant secretary of the association, is the executive secretary of the commission. A supervisor of the playgrounds has not yet been chosen. The commission intends to use every possible care to select a man of tact, judgment and experience, a policy which promises thoroughness in handling the whole problem.

DR. C. S. BERNHEIMER GOES TO BROOKLYN

Dr. Charles S. Bernheimer, for four years assistant headworker of the University Settlement in New York, leaves the settlement this month to take charge of the Hebrew Educational Society of Brooklyn. Dr. Bernheimer, who has been a social worker in both Philadelphia and New York, brings to his new work much experience and a keen interest in problems connected with the Jewish immigrant. In 1905 he edited a compilation on the Russian Jew in America, his own contribution being a study of the Jewish population of Philadelphia.

Since his connection with the University Settlement besides his regular club work he made a study of a block in the lower East Side, and later a study of East Side rents during the period of hard times.[1] During the past year he presented facts as to conditions in this part of New York to the Committee on Congestion, and made a study of the shirtwaist strike which was published as one of the University Settlement Studies. He has written and lectured on immigration, settlements, and practical social subjects.

The work of Brooklyn Hebrew Educational Society includes manual, domestic and religious training, courses preparatory to the regents' examinations, instruction in home nursing and gymnasium practice, clubs and classes for mothers, gardening, and other activities carried on by social settlements.

NEW SECRETARY FOR THE ST. LOUIS CIVIC LEAGUE

By reason of his large acquaintanceship with those in social work all over the country, the appointment of Roger N. Baldwin as secretary of the St. Louis Civic League has more than local interest. Mr. Baldwin went from Boston to St. Louis in 1906 to have charge of Self-Culture Hall and to head the new department of sociology at Washington University. In 1907 he became chief probation officer of the Juvenile Court and it was largely through his efforts that a

[1] See THE SURVEY for January 4 and 18, 1908.

new juvenile court law was enacted last year. While director of Self-Culture Hall, Mr. Baldwin organized the St. Louis Social Service Conference, composing now in its membership of 175 practically all the active social workers of St. Louis. He is also a director of the St. Louis School of Social Economy and secretary of the National Probation Officers' Association. In his new office he succeeds Mayo Fesler, who goes to Cleveland to be secretary of the Municipal Association.

The St. Louis Civic League has an active membership of 1,800. In large measure it has restricted its field of operation to the physical betterment of the city and has had gratifying results in dealing with parks, playgrounds, billboards, lighting, garbage collection, and the like. Lately its tendency has been toward including moral and social betterment, and it is in this direction that Mr. Baldwin will probably extend the work. He holds that public service should be a profession and not a plum tree, and that a reconstruction of the whole mental attitude of the public toward municipal service must be built up. The Civic League, already interested in charter revision and several other such issues, will probably work more and more for pure, non-partisan city politics.

ST. LOUIS CITY CLUB

Following the lead of New York, Chicago, Philadelphia, and Boston, St. Louis has organized a City Club modeled closely after the Boston organization. The membership will probably reach 1,000 within a few weeks. A floor of one of the large downtown office buildings will be rented and, though the club will be largely for luncheon purposes, it will be open evenings. At least once a week there will be regular discussion of civic questions by in and out-of-town experts and it is presumed from the character of the membership that the daily table talk will be largely of civic matters and questions of the day. The club will, of course, be non-partisan politically. City officials, representative business and professional men, labor leaders, and others attended the organization meetings.

Young men will probably predominate in the membership. Luther Ely Smith, president of the Municipal Voters League, was made temporary chairman, and Roger N. Baldwin, secretary-elect of the Civic League, acting secretary.

HEALTH DAY IN BOSTON SCHOOLS

At the second annual Health Day in the public schools of Boston on October 7 a pamphlet, The Co-operation of School Children in Securing a Cleaner Condition of Our Streets, prepared by Mayor Fitzgerald, was read in all the elementary schools in all the grades, and in high schools special exercises were held on the importance of health. The lessons were drawn from the courses in physiology, hygiene and physical education and from the prescribed courses in athletics, games and plays. In many of the upper elementary grades and high schools, special speakers were secured. The pupils were instructed in recent changes in the school rules and regulations calling special attention to room temperature, ventilation, opening of windows during exercises, and in the gist of recent legislation which makes it necessary for every pupil to furnish a certificate of good health before procuring a working certificate. The law which went into effect October 1, abolishing the use of common drinking cups in schools and public places, was also explained.

In the afternoon in Tremont Temple, over 2,000 Boston teachers listened to an address by Joseph Lee of the school committee on physical education in the schools. Mr. Lee said that inasmuch as we force the child to go to school medical inspection is the way of protecting him from injury after we get him there. Another interesting feature of the Tremont Temple meeting was the illustration by seniors from the Boston Normal School of games and dances which they learn to teach pupils from the primary grades to the grammar grades.

WHO PAYS THE TAXES IN GROWING CITIES

JOHN MARTIN

Social workers in growing cities are usually busy increasing city expenditures. Every year they find new social purposes for which public money should be spent. Schools must be improved, they say, industrial education initiated, medical inspection of children extended, hospitals enlarged, anti-tuberculosis campaigns fought, playgrounds established, parks improved, health protection bettered, tenement houses inspected, children's courts inaugurated, probation officers appointed. More and ever more money they demand.

Therefore it is of vital concern to them to know who pays the city taxes. Do the dollars they persuade mayors and aldermen to appropriate come out of the puny earnings of tenement dwellers? Does every cent expended on municipal playgrounds leave only so much the less for the immigrant rent-payer to spend on bread and milk? Must the swarms in the tenements crowd the closer because their petty income has been charged with the costs of a tenement department? On whom does the burden fall? If the ill-nourished family in the two-room flat must give up a pint of milk for every lesson in cookery which the girl gets at school, the price of a loaf for every hour the boy spends in a gymnasium, then the social worker may well lie awake o' nights wondering if his work be humane or cruel, whether he is blessing the poor or robbing the poor.

In an article on Our Bungling Taxation[1] a writer in THE SURVEY recently said that "the tax is ultimately shifted on the tenant," that all the taxes on a tenement house are "in the tenant's rent and he doesn't see it, but under normal conditions he pays it just the same." If that contention, the stock argument of complaining real estate interests at election periods, be demonstrable, then this writer's conclusion is incontrovertible, that "every cent in taxes taken from these families is practically injustice"—unless, indeed, it can be proven that the city spends more efficiently and on more urgent needs than the families near the poverty line would spend, a proof surely hard to make even in the best-governed cities. Clearly social workers would not be justified in taking the bread out of the baby's mouth in order to endow a hospital bed, in robbing the wife of a day in the country in order to enlarge a park, in depleting the pitiful family savings in order to employ a teacher in economics, in taking the father's fare money and forcing him to live near his work in order to pay for a commission on congestion and city planning.

Happily, however, they need not put on sackcloth and ashes, for the burdens of taxation in growing cities fall on shoulders well able to bear them.

In the following discussion I shall consider conditions in New York city, because New York is the supreme type of a growing city, because there lots and buildings are separately assessed, and because small differences in systems of taxation and in trade customs between cities make slight modifications of the argument necessary in each case. These the reader can supply for his own city.

Real estate taxes, which alone are under consideration, are levied on (1) land and (2) improvements. Whether or not these items are assessed separately their joint value goes on the tax rolls.

As to who pays the tax on land there is no dispute among reputable economists. The owner pays the bill and he cannot pass on the burden to the tenant. In the words of Prof. E. R. A. Seligman, "It may be laid down as a general rule that a tax laid on the owner of the site cannot be shifted."[2]

[1] THE SURVEY for July 16, 1910. Price, 10 cents.

[2] Incidence of Taxation, third edition, pp. 281-2.

In New York city this year the assessment for taxation is:

Ordinary land value.....	$4,001,129,651.
Improvement value	2,490,206,348.
Total.....	6,491,335,999.

Therefore out of every thirteen dollars levied as taxes on real estate eight dollars —about two-thirds—is levied on the land. This major part, by the unanimous verdict of authorities, is paid exclusively by owners.

As to who pays the other five out of every thirteen dollars, the portion levied on improvements, there is not the same unanimity. The majority opinion is that the occupier, in the long run, pays it in the form of higher rent. This conclusion is reached as follows:

> Buildings require the investment of so much capital and labor. They require an outlay for construction, for maintenance, for repairs, for insurance. No one will enter on the business of having houses built for investment unless he can count on a definite return, which must in general be equal to the returns from capital invested in undertakings of approximately the same nature. A tax imposed on the owners of the building will therefore generally be shifted to the occupiers; for, if the tax could not be shifted, it would reduce the profits of the owners below the customary level in similar investments. The result would be a cessation of building operations, a consequent scarcity of houses and a gradual increase in the rent or value of existing houses, until the margin became high enough to tempt the investor into further operations. . . . Given a stationary supply of houses, their value or their rent will rise only with the slow increase of population, that is, with a relative diminution of the supply. But in the long run the working of the law is inevitable. Such a tax will, therefore, be shifted to the consumer, that is to the tenant.[1]

It will be noticed that the doctrine asserts that, at most, the taxes on improvements can be shifted to tenants only in "the long run," at the end of a period sufficiently prolonged to show the effects of a check in building operations. The doctrine also implies that a tax on owners of buildings, if not borne by them, will be shifted to the tenant.

But there is another person who may possibly be shouldered with the burden—the landowner. When, as in New York, population and land values are growing and when new areas are constantly brought into use for building, the burden is really thrown on that individual's capacious back. In the districts just being developed this burden-bearer is usually the owner of the vacant land which awaits improvement by buildings. In the built-up districts he owns usually both lot and improvements.

How is this conclusion reached?

In New York city houses are generally erected by builders to sell to investors, the builder doing all the bargaining with the landowner and assuming all the risks of meeting the public taste and of securing tenants. When his house is full he puts it on the market and obtains a purchaser for land and building as one investment by showing that the net returns, ascertained by deducting from the gross rents all costs of operation—insurance, repairs, water, taxes, janitor and so forth—will pay the investor six or seven per cent on his money.

The incidence of the tax on the building is seen most easily by considering a district partially developed. There the rent obtainable at any time for a certain standard of house accommodation is known. The factors of accessibility (depending mainly on rapid transit), convenience to centers of population, to stores, churches and schools, the water supply, lighting and drainage facilities and so forth, are all known, and house rents under the conditions existing have been determined.

A prospective builder, therefore, can calculate exactly how much he can pay for a lot and yet be able to erect a house and to show a prospective purchaser a satisfactory net return on his investment for land and building. In calculating this net return taxes are always included among the fixed annual charges. Therefore if the lot-owner asks such a price that the net return would be less than normal if that price were paid for the lot, the builder declines the bargain.

Can the lot-owner, however, compel the builder to pay the price demanded? If he can, the builder must either exact a rent sufficient to yield a return on the

[1] Seligman, Incidence of Taxation, page 287.

price or lose money on the whole operation. Here is the crux of the problem as to the incidence of the taxes on the buildings. If the landowner had a monopoly, or if all the land available for building were held in a few hands, all of whom were prepared to forego profits for a few years, then the lots might be withheld until rents on existing houses were so high that the builder could afford to pay the price demanded, and still obtain a net return on the new house and lot sufficient to secure a purchaser. Actually, however, there is competition among lot-sellers for purchasers and the value of a lot at any time in any district is limited by the rent which buildings to be erected on that lot will bring at that time and place. It is misleading to reason as if the landowner could fix the price of the lot and the future occupier could be compelled to pay the interest charges on the price thus arbitrarily named. If that were the case there would appear to be no limit to the landowners' demands.

It is objected to this line of reasoning that the "ground-owner is in the stronger position and as between the landowner and the tenant the tenant is the weaker party. The house builder knows in normal cases of increasing demand that he can more easily raise rents (since demand increases) than compel the ground-owner to take less than the market value. The landowner is not compelled to part with his land; but the tenant is compelled to occupy some apartments."[1]

"To take less than the market value." But what is "the market value"? That is the whole problem. Market value depends on net returns after taxes and other operating expenses are paid. Market value is simply net return capitalized. The higher the taxes the less the net return for the given rent—which is a known quantity at that time and place,—and therefore the less the "market value" of the land.

"The landowner is not compelled to part with his land" only in case he can afford to hold it and all other landowners in that neighborhood agree to stand out with him for a higher price. And not only owners in that neighborhood, but also owners of land suitable for buildings anywhere around the city. So long as the builder can secure land anywhere at a price which, upon the rents obtainable then and there, will show a normal return on the total investment, he will not pay any landowner a higher price in the hope that, for the houses he will build, he will be able to exact a rent higher than is being paid for like accommodations in the same neighborhood.

The compulsion upon the tenant "to occupy some apartments," a compulsion which will make him willing to pay a rent increased by the amount of the tax on the building, becomes operative only if the land monopoly is so close that builders cannot buy land and supply apartments fast enough to keep pace with the growth of population. Before bridges and subways were built this was the actual condition in Manhattan and rents rose fast.

In a district just being opened to population the builder cannot calculate with the same precision how much rent he can secure for his houses when erected, as he can in a district already partially developed. Public taste, fashion, racial and religious preferences, the loneliness of a new district, the distance from stores, the absence of schools and churches, the uncertainty of water and light supplies, untried transportation facilities—all these are bewildering factors. The successful operator is he who calculates them with the greatest accuracy. When he proves by experiment that he can get urban rents for the houses which he erects on rural lands, he is able to sell at prices compounded of building costs and urban lot values. Then he wins a rich surplus over the near-agricultural price which he paid. For he pays the non-active landowner originally only such a price as will leave to him, the operator, ample returns for the risk he runs—returns calculated after all operating expenses have been met. Among the operating expenses are included the taxes both on the land while he is laying it out and upon the houses when they are erected. Were the total taxes less he could afford to pay more for the land, all other conditions remaining the same; were the taxes higher he would pay less for the land, all other con-

[1] Seligman, Incidence of Taxation, page 291.

ditions remaining the same. If taxes were so high that he could not afford to pay more than the value of the land for agriculture, then the farms would continue to be cultivated, house building would be checked and rents would rise. In practice, however, there is a wide difference between agricultural values and the lowest lot-values.

As a rule a district is rapidly made available for building by the extension of a railway or an electric line, the opening of a bridge, the erection of a large manufacturing plant or the like. Then a wide margin is created between agricultural and lot values—a margin which is narrowed by high taxes, unless the whole area thus made available is held as a close monopoly.

Economists agree that the rents in the old, congested parts of a big, growing city are limited by the rents of the new houses in the suburbs. The difference of rents in different districts for rooms of the same size, style and airiness will measure the difference in desirability of location. Tenants will leave the old part when the rents in the newer parts are so much lower as more than to compensate for cost of carfare, inconvenience of a double journey each day, and remoteness from white ways, showy stores, amusements and so on. Therefore, since in the newer districts the tax on the building does not affect the rent, neither does it affect the rent in the congested districts. Rents in the built-up regions do not go up or down as taxes go up or down. In those regions rents fluctuate exclusively as demand for accommodations fluctuates, and that fluctuation, for a given population, depends exclusively on the rents in the newer houses, which, in turn, do not vary with the tax rate. If population decreases rents fall whatever the movement of the tax rate. Rents in the congested quarters of New York decreased in 1908, after the panic, when migration set towards Europe, because the demand for tenements diminished. In every decaying town, though taxes may rise, rents fall, until finally houses are abandoned.

It is considered by economists as beyond dispute that, when urban lands change hands, the purchase price is normally fixed so as to allow for the capitalized value of the existing taxes. By "this principle of capitalization the new purchaser of the site buys himself free of the tax." "The tax virtually disappears and becomes a charge on no one. In the meantime, however, it is the original owner or his heir who suffers."[1] Precisely the same principle applies to house and lot when, as is the custom in New York, they are sold together. The purchase price is fixed after allowing for the taxes as an annual charge and thus the whole tax is capitalized. "The tax virtually disappears and becomes a charge on no one. It is the original owner or his heir who suffers"—not the tenant.

Both the argument that taxes on buildings are shifted to tenants in the long run, and the argument of this article that the taxes are shifted to the site-owner accept the contention that rents of old houses vary according to rents of new houses which compete with them, and that rents of new houses, in turn, must meet in the long run the costs of building and maintenance. Therefore, whatever factors are included in the costs of building or in the annual expenses of new houses affect the rents all over the city. Whatever increases the cost of new houses (for the old standard of accommodations) tends to raise rents in both old and new houses; whatever decreases the cost of new houses tends to decrease rents in both old and new houses. Among these factors taxes hold only a minor place. More important are (1) cost of building materials, (2) cost of labor, (3) cost of loans—*i. e.*, the interest rate. By the increase of prices since 1896 and by the constant increase of wages the cost of building has risen rapidly. Interest rates are also rising, rising much faster than taxes. A builder usually gets a mortgage on land and structure for at least two-thirds of their full value, which mortgage is assumed by the investor when he takes over the property. An increase from four per cent to five per

[1] Seligman, The Incidence of Taxation, pp. 282-3.

cent in the average mortgage rate is of far more consequence than an increase of a few points in the tax rate. The total tax is a fraction over one and three-quarters per cent and, by constitutional limitation, cannot rise above two per cent. Fluctuations of this rate are measured by mills and, within the last seven years, the increase of the rate has been only three-tenths of one per cent—an increase that can have had but small effect upon the annual expense of conducting a tenement or apartment house, compared with the effect of the recent rise of over one per cent in mortgage rates and of the increase by over thirty per cent in ten years in the cost of building. Taxpayers who raise loud outcry over every trifling increase of taxes are straining at a gnat and swallowing a camel.

One point is clear. While social workers can be positive that eight-thirteenths of real estate taxes certainly do not fall on the tenant; and that, as to the other five-thirteenths, there is as much reason for supposing that the landlord pays as that the tenant pays, and while such authorities as Lord Goschen, Marshall, Pantaleoni, Edgeworth and Cannan assert that the owner pays surely a part of the five-thirteenths, enthusiasm for increasing municipal expenditures for social work need not be dampened by fear of imposing hardship instead of benefit.

Further, social workers can be easy in conscience about the fate of the "original owner or his heirs" who carry the load. Their lot has indeed fallen in pleasant places; for, despite all taxes, ordinary and special, which fall upon them in New York and the other growing cities, they receive, beyond the ordinary rate of return on their investments, a juicy bonus in the shape of what John Stuart Mill christened "the unearned increment", an increment for which "they toil not neither do they spin."

For the last four years, two of them fat and two lean, the average annual increase in the value of the naked site of Greater New York has been $150,573,813, all but a small margin of which is due simply to the growth of population, manufactures and commerce and to the habits of industry, order and refinement prevailing among the people. The whole of these unthinkable sums has gone as a free gift from the community into the pockets of the real estate owners. Some have got more; some less. In odd spots values have receded; in general they have fast advanced. On the average, the fortunes of the taxpayers, without effort on their part, have steadily swollen. For the improvements they have made they could get today all that they have expended on them; and, in addition, they could sell their lots, in the aggregate, for over $600,000,000 more than they would have fetched four years ago. Well might Prof. Thorold Rogers exclaim, "The landlord grows rich in his sleep."

If, then, social workers see ways by which city expenditures will abate disease, prolong life, reduce vice, extend opportunity, elevate character, enlarge manhood, surely they are justified in urging city officers to make the expenditures. The money so used will simply reduce the amount of the annual gift which the city makes to the owners of its site. Is there the faintest reason to be niggardly in providing for hospitals, schools, parks, playgrounds, baths, for Health Department and Tenement Department, for medical inspection or the enforcement of pure food laws, while tens of millions of dollars drop annually, a lucky windfall, into the pockets of those who must pay the taxes? Every fresh municipal social service is a new instalment of social justice. Every dollar wasted or stolen in connection with these services is a robbery of the poor; every improvement in their administration, a blessing to the poor. Social workers need concern themselves only with the necessity, the adequacy and the beneficial and efficient operation of the city services they recommend; they need not be anxious about the sources of city revenue. So long as the humanitarian activities of the municipality are so administered as to elevate and help the recipients, no fears need be entertained as to their desirability. Each extension of such community effort brings nearer the kingdom of heaven on earth.

A MILLION FOR TUBERCULOSIS

ERNEST P. BICKNELL
NATIONAL DIRECTOR, AMERICAN RED CROSS

Plans are laid for a record breaking sale of Red Cross Christmas seals this year under the optimistic slogan of "A Million for Tuberculosis." Last year the sale brought in $240,000 but there are several reasons for believing that this can be greatly increased.

To begin with, the cost of seals to local agents has been reduced from twenty per cent to twelve and one-half per cent of the total receipts. Many anti-tuberculosis associations which did not sell the stamps in 1909 are preparing for an active campaign under the new terms. With eighty-seven and one-half per cent assured to the local agent, there is believed to be a certainty of substantial profit this year for every association which makes a vigorous effort.

Moreover, in addition to reducing the charge to agents, the Red Cross has decided to divide evenly with the National Association for the Study and Prevention of Tuberculosis any profits which may accrue from its twelve and one-half per cent. In short, the Red Cross desires to manufacture and distribute the ammunition for the campaign. The agencies will conduct the sale, reap the profits, and expend the money in maintaining their local work against tuberculosis. The Red Cross expects no more profit than a barely sufficient margin to insure it against loss, should unfavorable conditions arise.

In all parts of the country, social, civic, fraternal and charitable organizations are uniting in the Christmas sale. Lodges, labor unions, and women's clubs, besides nearly 450 regular anti-tuberculosis agencies and seventy-five local chapters of the American National Red Cross, are among the agencies which will help.

Some confusion resulted last year from the mistakes of persons who attempted to use Red Cross stamps for postage. A good many letters and parcels, as a result, found their way to the dead letter office. To prevent a recurrence of this difficulty, the Post Office Department has requested the Red Cross to discontinue the use of the word "stamp" in describing its "stickers." The department has also prohibited affixing the "stamps" on the face of letters or packages. Certain foreign governments made serious objection to the admission of letters and parcels from the United States bearing Christmas stamps upon their faces. The Red Cross accordingly has adopted the name "seal" instead of "stamp" as suggesting the back of letters rather than the face.

Suggestions as to detailed methods for conducting a local Red Cross seal campaign may be obtained of the National Association for the Study and Prevention of Tuberculosis, 105 East Twenty-second street, New York. A few general suggestions, however, will perhaps be of value here.

Plan to interest in the local campaign every possible group. Church calendars, for instance, should announce the sale of seals. Local papers should be kept supplied with stories and information. Lodges and labor unions will probably give an evening to a lecture on tuberculosis with special reference to Red Cross Seals. Women's clubs and other organizations will usually help furnish attendants for selling booths. In many cases, influential women will pledge themselves to dispose of a certain quantity of seals and every bank, factory, and large corporation should be invited to use them on its mail. Advertising slips should be distributed to every large store to be inserted in all parcels. School children make excellent sales agents.

These are but a few of the more general suggestions which might be offered. An early beginning should be made to enlist the co-operation of every man, woman and child. On the other hand, the actual sale should not begin before

Thanksgiving, or interest may abate before Christmas.

The American National Red Cross has already printed 25,000,000 seals, and arrangements have been made to avoid all danger of a shortage by printing as many millions more as may be required. Advertising matter will be distributed liberally. The Red Cross will supply it to local agents without additional cost. It will be varied and artistic, including posters for billboards, cards for windows and selling booths, and slips for envelope enclosures. An extensive newspaper campaign will be handled jointly by the publicity bureau of the National Association for the Study and Prevention of Tuberculosis and the Red Cross, supplemented by local press work.

With "a million for tuberculosis" to be expended next year, immeasurable good could be done. Progress today is usually slow because the community requires preliminary education, and financial backing for an educational movement is difficult to obtain. This lack can be supplied by the sale of Red Cross Christmas seals. The opportunity is open to every reputable anti-tuberculosis organization in the United States, and in places where no such societies exist, to any associations interested in the prevention of consumption.

Information concerning appointment of agents, terms and conditions may be obtained from the American Red Cross, Washington, D. C.

THE INTERNATIONAL CONGRESS OF EDUCATORS

WINIFRED S. GIBBS

It would seem to be significant that a national government was ready to stand as patron of a great educational conference, and the student of present day conditions might well have been encouraged by a visit to Brussels while the International Congress of Education was in session. It was called officially a "congress of home education," but the questions and problems of the schoolroom were also discussed. The sections covered child study, circles of parents, the rural family, education before the school age, education during the school age, education of abnormal children. The countries represented included Belgium, Holland, France, England, Germany, Russia, Hungary and the United States. It is the purpose of this report to give the merest outline of the proceedings, to touch upon one or two central points brought out in each section, and to note a few impressions made upon one whose interests include sociology and pedagogy.

The teacher of domestic science so often noted, she who thinks her field limited to that of the classroom, would do well to attend such a convention as this. She would find that she was, or should be, fellow worker with physicians and psychologists, pedagogs and musicians, priests and artisans, and that her little "subject" was settling into its proper place as one of the agencies which might hope to contribute to better homes and better citizens.

The section on child study considered such questions as the attributes of children, their defects, physical and mental, methods of determining the effect of fatigue, heredity. England, America, Holland, Belgium, Hungary, Greece, Scotland, and France contributed. Mrs. Arthur Phillip, secretary of the Ministering Children's League of London, made a plea for parents' associations, and sketched a plan for their formation, and for their administration by committees which should take care that the discussion did not sink to the level of personal gossip. Dr. Drummond of Edinburgh discussed heredity and the extent to which results can be modified, saying that it is not enough for the educator to foster good tendencies and to starve the evil; he must also see that the good is placed near the child, and that he is taught how to make it his own.

Several speakers dealt with the cause of crime. Mrs. Frederic Schoff of Phila-

delphia took the ground that we should not take the so-called "criminal class" for granted, that each child has an unsullied nature and that if we safeguard this in the early, impressionable years, we may rob the "criminal class" of recruits. Mrs. Schoff gave an account of an exhaustive study of this question and ended with an earnest plea that a "chance" be given to each child. After all is said, does not that express what we are trying to do? Methods may be diverse, workers may differ on many points, but every social worker wishes to give a "chance" to those who come under his ministrations.

Dr. Tom Williams of Washington asked for co-operation between school and home; he showed that nervousness is often a "habit," and touched upon one phase of the much discussed part played by the mind in disease and in daily well being.

The section devoted to general questions opened many avenues for discussion. Mrs. Andrews of Boston told of the co-peration between parents and teachers in that city. The dietitian of the New York Association for Improving the Condition of the Poor attempted to show what may be accomplished by home instruction in proper feeding and economic living. Mons. l'Abbé Soulange Bodin of Paris was emphatic in his assertion that the choice of literature which a child shall read is of prime importance. To anyone just beginning to realize the social significance of every work, the paper of Fannie Luchmund of Teachers College, St. Louis, was interesting, as she traced the interrelationships to be found and made us realize that we are aiming at one goal.

Many of us sigh as we contemplate the numbers of incoming foreigners who never get beyond our own city, and think regretfully of how these people might expand in rural communities. John Medd, member of the departmental committee on agricultural education, had an interesting paper on this subject. He urged the reformer to develop village life which, in his opinion, tends to give the best results if moral character is the object of consideration. Instances were cited and statistics quoted in support of this view. Other questions considered in this section were the importance of religious training and the influence of music on character.

The section which treated of education before the school age, began quite properly, it would seem to a dietitian, with the question of right feeding, and continued with able discussions of all phases of instruction, especially of the governess, nurse, and others to whom are entrusted the care and teaching of children at home. Here were brought out the advantage of individual instruction, and the opportunity for advancement when the child is not hampered by association with mates mentally slower than itself.

The section on education during the school age had, of course, a large experience upon which to report. Mme. Meyboom of Amsterdam and Mary Wolseley-Lewis of London discussed the boarding school for young women. To one interested chiefly in the combining of interests and methods of home and school, it was interesting to note that a plea was made for a school building which had once been a home, even with the loss of a certain amount of space. The training of teachers, the possibilities of teaching domestic science in ways other than the formal class, and the question of industrial education found a place here. The University of Chicago was represented by Euphrosyne Dingley, who begged that the child should be considered before the object; that after instruction in necessary principles had been given, the student in manual training should determine whether he would make an airship or a clothes wringer.

The meetings given to the methods to be used in the study of abnormal children were among the most hotly contested at the congress. This is not the place, however, to detail discussions. Dr. Herbert Goddard of Vineland, N. J., told of his great human laboratory and something of the exhaustive methods used to study and help the defective. Prof. W. S. Monroe of Montclair also contributed to this subject, and Mrs. J. Scott Anderson of Swarthmore, Pa., made her hearers realize vividly the need of re-

membering, when dealing with the deaf, that "there is a mind behind the closed ears."

Special mention has been made of the part played by America at this great gathering, that those interested might learn how they were represented, but it would be only grateful to acknowledge the advantage to be derived from intercourse with workers in other countries and the inspiration from comparison of methods. A committee of American delegates met to consider the advisability of inviting the congress to meet in the United States in 1911. Many cities were suggested, but it was decided that Washington was the only one in a position to entertain the delegates, as there the social part of the meetings could be managed with no expense. Details of the plan were left to a later date.

A vote of thanks is due to the Belgian government for its cordial hospitality. The delegates were entertained at a reception in the beautiful Hotel de Ville, and everything possible was done by the reception committee to welcome delegates at all the meetings.

CIVIC IMPROVEMENT

CHARLES MULFORD ROBINSON, Department Editor

THE CITY SENSIBLE

In Portland, Ore., a movement for city improvement has been started under the title The City Sensible. This is a very good title, and has more accurately descriptive than the commoner phrase, The City Beautiful.

PLAYGROUND BAND

In Los Angeles, where administration of the playgrounds is interesting in a good many ways, it is reported that a band is to be organized among the boys on the Shatto avenue playground, which proposes to give concerts Sunday evenings, and to practice only the best music.

FASTER THAN AN AEROPLANE

Municipal Journal tells of a dirt road 380 miles long and stretching across the entire state of Iowa, which was built in one hour's time by a force of ten thousand men. It seems that a good roads meeting in Des Moines last spring the suggestion was made and received with general approval. Preliminary planning and organization followed, the republican and democratic local committees working in friendly rivalry for the common end. When the word was given, the long army of builders went to work and in an hour the road was finished. Probably 380 miles an hour is a record.

HINTS FOR SUPERVISORS

At a meeting some weeks ago of the Board of Supervisors of Adams county, Ill., resolutions were passed which offer excellent suggestions for boards of supervisors in other counties. They were introduced at the request of the Boulevard and Park Association of Quincy, and are as follows:

"Whereas, bridges on the highways and other county properties in Adams county are used for advertising purposes, and without the consent of the county, thus disfiguring expensive properties, and

"Whereas, the county should not show preference in allowing such advertising by any firm, corporation or individual, therefore be it

"Resolved, that all advertising should be prohibited on county property, and on trees and fences along the highways; and be it further

"Resolved, that this preamble and resolutions be referred to the committee on county roads."

PLAY AND THE CHURCH

This department—in which there have been notes from time to time on the Church and the Playground—has meant for a long while to call attention to the discussion of this subject in the March number of the *Playground*. The number was beautifully illustrated, and full of suggestion and interest for those concerned with this particular question. Dr. Gulick contributed a general article in which he said that "the spiritual life cannot be lived apart from the world. When the church throws open the gates of its beautiful grounds in order that within the enclosure the people may have opportunities for play, this action stands as a symbol—a symbol of the relationship of religion to life." It is not enough "that we shall attack that which is anti-social and anti-religious in our corporate body—for example, the association of the dance hall with the saloon—we must conduct our fight chiefly along constructive lines. We must present that which is better, rather than merely antagonize that which exists."

AN IMPROVEMENT CHARTER

A recent editorial in the Indianapolis *Sun*, reprinted in the Fort Wayne *Journal-Gazette*,

and doubtless in other papers, contained an admirable statement of the need in each community of a central improvement association, and of its opportunity. It said: "To develop a city along broad-gauge lines, along lines that mean civic growth instead of sectional or class growth, and substantial, permanent growth instead of spurts, needs a great central body that will breathe the broad civic spirit of 'all for one and one for all' into all the organizations of particular trades, commercial bodies, business associations and sectional improvement associations." The association in Fort Wayne has been incorporated —as improvement associations are not very often—and its purpose is defined as the "laying out of parks, playgrounds, boulevards and pleasure drives in and near the city of Fort Wayne; to govern, manage, control and improve the same"; and for such purposes authority is given it to take and hold such property, and to exercise its powers in trust for the city of Fort Wayne. Should the association be dissolved, all its property must go to the city. By the terms of its charter, it is organized without capital stock or pecuniary profit, and the by-laws provide that its officers shall serve without salary.

MASSACHUSETTS ADVERTISING LAW

The Massachusetts Civic League has published a folder on The Advertising Nuisance; the Law and How to Work It. In general terms, it says that no advertising sign may be put up anywhere in Massachusetts, without the written consent of the owner or tenant of the land on which it is exhibited. Of course advertising signs very often are put up without such written consent, and the problem with which the folder has to do is how to deal with these illegally placed advertisements. Three methods are suggested. Under the first, or "diplomatic method," one may simply write to the person directly responsible and ask him to remove the sign, threatening him with the fine imposed by law if he does not comply with the request. "This method has the merit of giving the offender some trouble and of thus acting as a deterrent." The second, or "circumspectly legal method," is to ask the owner or tenant of the land whether he gave a written consent, and if he did not, to induce him or some public officer to go to the nearest police court and ask that the offender be prosecuted. One may also safely tear the sign down himself. The third, or "crowbar method," is to go ahead and pull the signs down simply on one's own belief that they have been illegally placed. Of course there is some element of risk in this, but if enough people took the risk the advertising nuisance would be soon lessened.

AN APPEAL FOR PARK MONEY

The report for 1910 of the Metropolitan Park Commission of Providence is the usual well illustrated and complete statement of the needs and desires of the commission. The principal appeal, which is for a comparatively small bond issue needed to make certain necessary purchases of land, has been put by the secretary in a novel and interesting way. He says:

"Each year we add to our hoarded wealth more than enough to provide the most splendid park system in the United States. Each week the pay roll of the metropolitan district is enough to provide for two park systems like that proposed by the Metropolitan Park Commission and shown in orange color upon the map. Each year the interest paid out to depositors of the savings banks is more than the whole of the ultimate investment that has been suggested. We have about as much wealth on deposit within gunshot of Market square as was required by Baron Haussmann to make over Paris. . . . Citizens of Providence donate more than a million to philanthropy each year, and enormous sums to the reformation of criminals; yet vice and crime and misery may be largely prevented by happy surroundings for its generations of children. . . . A merchant would think very little of investing one per cent of his capital to bring his establishment up to date, to improve it, and add to its convenience and beauty and its opportunity for doing business in competition with his neighbors."

STUDYING CIVICS

Perhaps the editor of this department may be pardoned for quoting part of a personal letter which he has received from so good an authority on civics as the chairman of the civic department of the General Federation of Women's Clubs. Mrs. Moulton writes:

"Were you ever in a civic class of teachers? If not, you do not know what you have missed. It was my rare privilege to attend such a class in Cincinnati just prior to the closing of the schools in June. Here was a large group of the upper grade teachers, met together to study civics that they might be the better equipped to instruct their pupils in their obligations to their city and to their school. The discussions were interesting and on leading civic topics that concerned the city. Their meetings had continued throughout the school year. To me this normal class in civics tells its own story—that a higher civic life now confronts our cities—both large and small—and that the aim of education means the forming of boys and girls into the graceful art of being true citizens."

Mrs. Moulton encloses a leaflet which the class has sent to all the principals and teachers of the Cincinnati public schools. It is based on recognition that, "regardless of what may be our special work, the chief duty of each of us is to train citizens. This means, in part, that we should endeavor to create such a sense of civic duty as will cause the children to feel a greater personal responsibility in promoting the welfare of the home, the school and the community." Further, it pre-

mises that "we are in the midst of a great movement to make our cities places wherein people may more nearly enjoy complete living," and twelve questions are submitted which the leaflet suggests, might well be put to the children by way of awakening their interest and sense of responsibility.

DENVER'S CIVIC ADVANCE MAYOR

In an address delivered some months ago before the Denver Chamber of Commerce, Mayor Speer, an enthusiast on city improvement, said:

"The real good things in life do not come without effort. It costs money to build a city, but money wisely spent for that purpose is a wealth creator; it pays a higher rate of interest than any other investment. There is a difference between the hardships of the plains and the comforts of a city. You would not be without these conveniences for many times their cost. The people of Denver pay in taxes to conduct their city government about two cents each per day. This amount is so distributed that over three fourths of our population pay an average of less than one cent per day. Now stop to consider the protection, amusements and comforts they receive in return for this payment."

The mayor observed, further on, that when parks were purchased in a certain district, objections were made because the bonds did not run for fifty years instead of for fifteen. "Yet when the assessment was made, forty-six and one-half per cent of the entire cost was paid within the first thirty days." He added that when the Cherry Creek wall and drive were suggested, many ridiculed the idea and claimed that it was not a proper locality in which to build a boulevard. "Yet since a part of it has been completed, we have found that property values have more than doubled, and what were formerly dumps are being transformed into places of beauty." He closed his address with this suggestion:

"At best life is short. We want the good opinion of our fellow men while here, and to be kindly remembered after we have passed on. I know of no better way than to cultivate and unfold some blossoms along life's path, add rest stations, play stations and beauty spots along the way. The time will come when men will be judged more by their disbursements than by their accumulations. Denver has been kind to most of us, by giving to some health, to some wealth, to some happiness and to some a combination of all. We can pay a part of this debt by making our city more attractive."

AN INSPIRING PETITION

About a year ago, under the title of A Civic Revival, THE SURVEY contained an article describing a remarkable campaign which had recently culminated in Fort Wayne, Ind. The end of that campaign, it may be recalled, was the summoning of a city planner to make a study of Fort Wayne, and suggest what the people in their newly awakened enthusiasm could best do. The city planner, whose report is in press at this writing, made a long list of suggestions. Some of these have been carried out, but the biggest was so big that it seemed as if nothing could be done at once. This was the redemption of the rivers. But history repeats itself, and there is again a story of people who are unable to forget the vision they have seen. A petition addressed to the honorable mayor, the Common Council and Board of Public Works of the City of Fort Wayne comes to hand, signed by all kinds of people.

It prays the council to authorize the appointment of a non-partisan "waterfront commission", to consist of the mayor, one member of the Board of Public Works, one member of the Park Commission, three members of the council and three citizens not in office, the commission to serve without pay, but the council to appropriate $5,000 that a skilled hydraulic engineer may be retained to make studies for the location of dams, etc. Further, the petition prays the council to levy an annual tax of five cents on the $100 of property valuation in the city, to the end that the plans recommended by the commission and its engineer may be carried out. Now, is not this widely signed petition, asking that taxes may be increased in order that the city may be made more beautiful, a fine thing and a fitting chapter to follow the civic revival?

COMMUNICATIONS

WEST SIDE INSTITUTE

To THE EDITOR:

Mistakes and misstatements are not uncommon in the daily press and in periodicals. It is somewhat to be regretted, however, that THE SURVEY, the acknowledged organ of the social movement, has been gravely misinformed concerning the facts in regard to a new and important piece of social work. The case is even more regrettable since absolutely accurate information was obtainable in the same building where the editorial offices are located.

I refer to the editorial in the issue of October 8, 1910, Reorganization of West Side House. Passing over several minor errors, it is stated, "The Board of Directors . . . guarantee $10,000, to meet expenses, including a reasonable rent." This is exactly what has not been done. The directors have guaranteed only a part of this $10,000 fund, and are now engaged in a campaign to raise the remainder. The rental of the building has been successfully financed, provided that the money

for the running expenses is raised. Therefore the reopening of the building under the new name, the West Side Institute, is not assured, but hinges on the ability of the Board of Directors to secure the necessary $10,000 annually for a period of three years.

In many ways the organized effort which is now being made to secure the opening of the West Side Institute is a remarkable one. When the West Side Neighborhood House was closed and the building was boarded up, the people of the West Side realized, for the first time, the importance to them of that institution and the work carried on there. The bill introduced into the Legislature by Senator McManus and Assemblyman Boylan was one expression of this feeling. The failure of this effort seemed to mean the dashing of the last hope.

There were, however, some men in the neighborhood who had confidence enough in themselves and their neighbors to make another attempt. These men compose the present Board of Directors. They form a non-partisan, non-sectarian group, who represent interests as varied as exist in the neighborhood. The names of the men, almost all of whom live or have their business within a few blocks of the building, reveal the diversity of their interests:

Rt. Rev. Mgr. Joseph F. Mooney, rector of the Church of the Sacred Heart, 411 West 51st street; Rev. Winfred R. Ackert, pastor of the Vermilye Chapel, 416 West 54th street; Rev. Dr. James F. Driscoll, pastor of the Church of St. Ambrose, 515 West 54th street; Christian F. Tietjen, president of the West Side Bank, Eighth avenue and 34th street; Aaron Buchsbaum, wholesale and retail butcher, 729 Ninth avenue; Thomas C. O'Sullivan, judge of the Court of General Sessions, 340 West 55th street; Peter Schmuck, judge of the City Court, 325 West 39th street; Herman W. Beyer, president Beyer Dyeing and Printing Company, 505 West 50th street; Owen W. Bohan, attorney-at-law, 411 West 49th street; Edward Ewing Pratt, assistant professor of economics, New York School of Philanthropy, 105 East 22nd street; William Fellowes Morgan, trustee, Columbia University; William C. Demorest, president, Association of Columbia Alumni; Samuel Murtland, physician; Thomas H. Morgan, physician, 349 West 51st street; George F. Ewald, Chelsea Exchange Bank, 406 West 51st street; Arthur Wesell, Wesell, Nickel and Gross, piano action manufacturers, 45th street and Tenth avenue; Joseph H. Hayes, attorney-at-law, 451 West 47th street; Henry Miller, broker, 747 Ninth avenue; Herman Obertubbesing, official handicapper, A. A. U., 415 West 46th street.

This unlertaking is unique. For the first time a settlement may be established in response to a demand on the part of the neighborhood. For the first time the definite and distinct aim is to become self-supporting. For the first time the management is in the hands of the people. The whole movement is an experiment in democracy, and an effort toward community betterment which will be watched with interest by those interested in social progress.

EDWARD EWING PRATT.

New York.

THE FINANCIAL SECRETARY

TO THE EDITOR:

May I add a word of appreciation to many which you must have received for the admirable statement by O. F. Lewis, *re* financial secretaries, which you recently published?

Three additional tests of efficiency on the part of the management of appealing agencies occur to me as deserving place in Dr. Lewis's list:

1. That the work which the agency exists to do needs to be done;

2. That the particular way of going at that work which the agency represents is up to date;

3. That the work would not be done by any existing agency if the apppealing agency were not in the field.

WILLIAM H. ALLEN.

Director Bureau Municipal Research, New York.

THE SURVEY AS A SOCIAL TOOL

TO THE EDITOR:

I have just been getting out some new outlines for several of my courses in the Western State Normal School. This work brings to consciousness a fact that I had not realized before, that is, I find that I use THE SURVEY for reference purposes in connection with courses on hygiene, school organization and administration, history of the school, and the study of interests, activities and occupations rather more than any other periodical. We are fortunate in having men who can give us so effective a social tool as THE SURVEY is.

FRANK A. MANNY.

Kalamazoo, Mich.

JOTTINGS

New England Child Labor.—The National Child Labor Committee has temporarily discontinued its New England office, formerly located at 101 Tremont street, Boston, and has entered into a very close affiliation with the Massachusetts Child Labor Committee for carrying on the interests of this work in that state. In the other New England states steps are being taken to form state branches of the national committee and it is believed that with these strong local organizations, interest can be so promoted that New England will again take the lead, which she has lost to New York, Ohio, Illinois and many of the western states, in the matter of protection of working children.

THE COMMON WELFARE

A PARCELS POST MADE IN GERMANY

Wagons bearing the legend "Parcel Agency for the Imperial German Mail" may be seen every day on the streets of New York. That is, the German government offers here in New York for the benefit of its citizens at home a service that our own government will not render us. It is good evidence that John Wanamaker hit the nail on the head when he said some years ago that there are just four insurmountable obstacles to the introduction of a parcels post system in the United States. These four obstacles are the American, Adams, United States and Wells Fargo Express Companies. Mr. Wanamaker's opinion is quite widely shared.

Since his retirement as postmaster general the government has arranged by treaty for an exchange parcels post service with forty-three foreign countries. The rate of postage is twelve cents a pound, or four cents less than for small parcels within the country. The weight allowed by most of the treaties is eleven pounds while within the United States it is four. Except in a few instances, there is no limit to the value of the goods that may be sent. To several countries bundles cannot be registered and sometimes the service is restricted to certain named offices in the foreign country. There are differences in the customs declarations required by countries, in the kinds of articles that will be carried and in the charges for delivery, but the service is growing rapidly nevertheless. As a result a parcel may be mailed from Santa Fé to Smyrna, Dalny, Wei Hai Wei, or Montevideo which cannot be posted to Dallas, Denver, or New York. Parcels can be sent from Berlin to Brooklyn that cannot be sent from New York to Brooklyn.

The conditions are such that extensive use of the international parcels post is hardly to be expected yet, particularly as most people do not know even of its existence. During the year ending June 30, 1909, 1,136,690 pounds were dispatched from the United States, an increase of 17 per cent. The number of parcels was 438,558. From foreign countries we received 1,124,948 pounds, an increase of 540,281 or 92.40 per cent, mailed in 263,722 parcels.

The largest number of packages went to Great Britain, Ireland, Mexico, Germany and Japan. The first three had over half the total. The greatest number came from Germany and Great Britain. We sent about twelve times as much to Mexico as we received, whereas Germany mailed to us five times as much as we sent. Over three-quarters of the bulk of the parcels came from Germany and Great Britain. The exchange with Canada would undoubtedly be large if

GERMAN PARCELS POST WAGON IN NEW YORK.

that country and Russia were not among the few remaining ones with which treaties have not yet been negotiated.

Extensive as the service is from foreign countries, most European nations and Uruguay, besides Germany as already mentioned, maintain additional facilities in connection with certain express companies. These services were established before the government service, and vary from it in certain respects as to indemnity and insurance. Bundles that are not prepaid, that are over weight, or that contain articles not covered by the treaty agreement, are handled in this way. The French postal authorities turn over considerable trade to the American Express Company whereas Germany sends quite a little mail in the United States through Hensel, Bruckman and Lorbacher. This company handles about 15,000 parcels a year.

CITY CLUB PLANS A BETTER PHILADELPHIA

The current plans of the Philadelphia City Club, which grew out of the reform wave of 1905, merit the happy phrase of the *North American* of that city, "a new and enlightened campaign for advancing Philadelphia." After the animosities of that campaign died, the club, which was associated with the City Party, realized, in the words of the annual report, that it must include men "of every shade of political belief and men of no political belief, as measured by the partisan standard." It was decided to appeal for a large representative membership and to secure experts to plan a "safe and healthful and intelligent and convenient and prosperous and beautiful Philadelphia."

Believing that the public has already the most important machinery for advancing Philadelphia, the club aims to make the citizens recognize that the municipal government is theirs, that it is owned by them, controlled and directed by them and financed by them.

To carry out this plan the club decided to get full and accurate information of what is being done for the common good by public and private agencies. A civic secretary was engaged to work under the general secretary, Richard Waterman.

Arthur W. Dunn, for several years director of civics in the public schools of Indianapolis, mapped out the plan for this year's work. The club will publish the addresses given at fourteen special meetings on Philadelphia and distribute them among city officials and the officers of citizen organizations. It will co-operate with school authorities by giving them material for teachers of civics in class work. City officials will be asked to exhibit lantern slides showing the equipment and work of the various departments. It is also planned to provide slides with explanatory text for a series of lectures on "What is Philadelphia doing to make herself a safe and healthful and prosperous and beautiful city?" These are to be loaned to local citizen organizations for use by their own speakers. The public school authorities, the home and school associations and other organizations will be asked to unite with the City Club to bring about a greater use of public school buildings for evening gatherings of a civic character.

At each of these special meetings city officials and citizens are to describe what is being done to accomplish certain benefits for the public. Under each topic the functions to be performed and the public and the private agencies at work will be discussed. These fortnightly meetings, which began October 15, will consider the broad subjects of Health, Safety, Convenience, Education, Prosperity, Philanthropy and City Plan.

Prof. A. C. Abbott of the University of Pennsylvania and Joseph S. Neff, director of the Department of Public Health and Charities, were the principal speakers at the opening meeting, devoted to the problem of how to secure clean milk.

PITTSBURGH SQUIRES AND THE PUBLIC

Philadelphia excepted, the cities of Pennsylvania are saddled with a system of aldermanic courts suitable perhaps for small towns and country sides, but rusty bludgeons indeed for securing fair play

and expeditious civil justice in the industrial districts. With the rise of the great tide of non-English speaking immigrants during the past twenty years, they have tended more than ever to become nests of all manner of graft and criminal abuse. Public opinion has long chafed under the system, but apparently only a change in the state constitution can eradicate it. As yet no successful steps have been taken to set this slow process of reform in motion, for the "squires" are entrenched behind an even more formidable bulwark—the Pennsylvania republican machine.

Within the past fortnight, William H. Matthews, the headworker of Kingsley House, Pittsburgh, has launched a blow at the system which is so well-delivered, specific and discomfiting in high places, that there is hope that it will dislodge the inertia even of those citizens who think that any civic evil is more to be condoned than the open discussion of it.

The facts are given out in the form of a report by a Kingsley House attorney in the current issue of the *Kingsley House Record*. They are the result of four months' investigation, primarily of the courts in the neighborhood of the settlement in what is known as the "hill district," an old residential quarter now inhabited by Italian and Jewish immigrants, Negroes, and the lower paid workers of all nationalities. How the taxpayers are fleeced of their money by crooked administration of the system is first made clear; next cases are cited showing the injustice meted out to ignorant litigants; and, finally, the operations of a double-faced court are exposed, in which the judge is both squire and municipal magistrate, and throws his work whichever way it will net him the most money.

The taxpayers of Allegheny county last year paid the sum of $33,120.50 to aldermen and justices of the peace, and their constables, on account of discharged criminal cases. When a person is brought before an alderman on a criminal charge, the alderman, after hearing the evidence against the accused, must

WILLIAM H. MATTHEWS.

hold him for court if there is a "prima facie" case against him, or else discharge him for want of sufficient evidence. In the latter event the county is bound to pay the costs, whereas cases which are returned to court have to run the gauntlet first of the grand jury and then of the criminal court. Either the grand jury or the court may deprive the alderman of his fees; only when the alderman discharges a case is he sure of obtaining his fees.

Of this $33,120.50, about one-half, or $16,861.85, was paid to 118 aldermen and justices of the peace throughout the county, and the balance to their constables. While some aldermen did not receive a cent for discharged cases and some received only three or four dollars, two aldermen in the hill district, Louis Alpern and Samul Frankel, together received $3,776.40, or nearly one-fourth of the $16,861.85.

Frankel's name has long been one to conjure with in Pittsburgh's under world. In 1906, he and Max Friedman were indicted on charges of leasing houses to be kept as bawdy houses. Friedman was convicted and Frankel got a Scotch

verdict. The year following he took office as alderman. In that year, 1907, 233 cases were discharged by him, for which the county paid him $760.20. In 1908 he had nearly twice as many discharge cases and collected from the county considerably more than twice as much in fees, viz., $1,741.25. In 1909 he increased his revenue from this source to $1,961.85. Both in 1908 and in 1909 he received more than any other alderman. These facts were drawn out by the investigators from the reports of the county comptroller. They found that Alpern's business in discharge cases was also steadily remunerative and second only to Frankel's. His record is as follows:

	Am't rec'd
1907—518 discharged cases	$1,711.55
1908—461 discharged cases	1,522.95
1909—467 discharged cases	1,814.55

Even more damaging is the comparison which the report makes between the records of Alpern and Frankel, and Aldermen T. V. McMasters, a downtown alderman who does a big business. To quote:

Aldermen Alpern and Frankel discharge so many of their cases that one would naturally suppose that the comparatively few cases which they hold for court would surely run the gauntlet of the grand jury and result in a fair number of convictions in criminal court. That this is not true is shown conclusively by the following table, based upon the district attorney's records and the comptroller's annual report for 1909.

	Alpern.	Frankel.	McMasters.
Discharged cases	467	512	15
Ignored by grand jury	65	40	33
True bills	84	47	131
Total	616	599	179
Percentage of discharged to whole No. of cases	% 76	% 85	% 8
Per cent of cases ignored by grand jury to whole No. returned to court	44	46	20
Per cent of discharged and ignored cases to whole No. of cases	86	92	28
Amounts paid by the county on account of discharged cases (Controller's Report, p. 156)	$1,814.55	$1,961.85	$42.35

It will be seen that although Alderman McMasters returned to court nearly twice as many cases as Frankel returned, and although Frankel discharged over thirty times as many as McMasters discharged, yet the grand jury ignored more of Frankel's than of McMaster's cases. And Alpern's record is like Frankel's. The action of the grand jury is the more significant in that it is based upon the very same evidence which was supposed to justify the alderman in holding the defendant for four. Neither alderman nor grand jury hears evidence for the defendant but simply determines whether the prosecution has made out a prima facie case against the accused.

THE SQUIRE AND THE "POOR DEVILS"

The iniquities of the Pennsylvania aldermen's courts in minor civil cases was brought out forcibly in 1909 in the report for the Pittsburgh Survey prepared by H. V. Blaxter and Allen H. Kerr, two members of the Allegheny county bar. The Kingsley House report goes further into the criminal work of the squires' offices, and does not mince matters in citing cases. Here are three in point:

An information was recently made before Alpern against a Poplar alley woman for prostituting a minor child. Alpern promptly discharged the case for want of sufficient evidence. The case was brought to the attention of the district attorney's office and a second information was made before Magistrate Kirby, who held the woman for court. The grand jury found a true bill and when the case came up for trial Alpern apppeared as a witness for the defendant. Shortly thereafter another information was made against the same woman for harboring another minor child.

In June, 1909, Joe Jeffitch, a Croatian, was arrested on a charge of criminal fraud, under a warrant issued by Alderman Samuel Frankel. A relative of the prosecutor claimed that a relative of the defendant owed him seventy dollars, so that this was not only an attempt to collect a civil debt by criminal process but the debt was one for which the defendant was in no way liable. He was planning to visit his home in the old country—had in fact bought his ticket and was on the point of leaving. After he was arrested he was told that if he would pay the seventy dollars and costs they would let him off; otherwise he would go to jail. He went to jail and sent for an attorney, giving up his trip abroad. The attorney defended him at the hearing and did his best to show the alderman that there was nothing in the charge. Frankel, however, reserved his decision. The attorney tried again and again to persuade him either to discharge the case or to hold it for court, and finally, Frankel, finding that he could not wear out the patience of the defendant or his attorney, held the defendant for court. The attorney himself signed the bail bond, paid a small fee

and saw the entry made in the alderman's docket. He thought that was the end of the matter for he felt sure that the grand jury would not find a true bill. Shortly afterward, however, while the attorney was out of the city, Frankel called at his office and wanted to settle the case. He was afraid he would lose his costs. When the attorney returned from his vacation he looked up the case in the proper office, but found that it had not been returned by Frankel. Upon further inquiry he found that Frankel had discharged the case and collected his costs from the county. Before collecting them he had to swear that his claim against the county of Allegheny was "correct, just and true in every particular" and "authorized by legal authority."

In a recent case of Commonwealth *vs.* John Rolls, the defendant, a Negro, was accused of a heinous crime in which an alderman is not permitted to accept bail. Mr. Alpern, however, not only admitted him to bail, but went on the bail bond himself. When the case came on for trial the defendant was not in court and the authorities had to call on Alpern to bring his man into court. The defendant was convicted and sentenced to the penitentiary, but the alderman still holds office.

THE SQUIRE AND THE CITY POLICE

The crime Rolls was guilty of was sodomy. The case brings up the third phase of the situation, for Alpern is not only an alderman, but a city magistrate. Some months ago the facts as to his action in the Rolls case were brought to the attention of Mayor William A. Magee by a probation officer of the juvenile court, Nannie Oppenheimer, who is fighting at every point for the children of the hill district, against the odds of disease and immorality which beset their growth. The mayor refused to remove Alpern.

In illustrating how Alpern plays both ends against the middle in his double capacity of police magistrate and alderman, the Kingsley House report quotes the statement of a police officer who in his official capacity has brought about 455 cases a month before Magistrate Alpern during the past year. He alleges that in a number of these cases, where he himself made the arrest, took the defendant to jail after hearing, got the witnesses into court, and took charge of the entire case, he later found that the name of the constable who served Alpern in the capacity of squire had been put on the information, and the squire's man had collected fees for work done by the police. The following cases are cited by the Kingsley House attorney:

In Commonwealth *vs.* John Gall, a police officer made the arrest and took defendant to No. 2 police station. The following morning he had a hearing before Police Magistrate Alpern and was held for court. A police officer made the information and subpoenaed the witnesses, although the subpoena was issued to Samuel Marks, constable for Alpern.

In Commonwealth *vs.* John Gons, the record shows that two informations were made before Louis Alpern, alderman, and subpoenas issued to Constable L. Aronson. But a police officer made the arrest and took the defendant to No. 2 police station where he had a hearing before Magistrate Louis Alpern. He was held over, and it was the next day that informations were made before Louis Alpern, alderman.

In Commonwealth *vs.* Thomas Schools, the arrest was made by police officers. Defendant was taken to No. 2 police station and given a hearing the next morning. This was a police arrest and the information was made before Louis Alpern, alderman. There were two hearings on the same day, the first at the police station and the second at Alderman Alpern's office on Fifth avenue.

Not long ago the district attorney's office called Mr. Alpern to task for collecting fees as alderman in cases which were really police cases, since informations and arrests were made and subpoenas served by police officers. Mr. Alpern then promised to return to the county his fees in thirty-three specific cases of this sort. The investigators found, however, that he had merely refrained so far from collecting his fees in some of the thirty-three cases. In two of them he had collected his costs and not returned them to the county, while in three of the cases the court had denied him his fees.

All aldermen's court records in Pennsylvania are without adequate review; it is often almost impossible to secure access to them. In the mill and mining towns of the state there are probably not a few squires of the old school, who bring wisdom and fairness to the settlement of disputes among the people. But it would be a fool's paradise to suppose that, on a lesser scale, these abuses in the "hill" courts are not repeated throughout the industrial district. Inquiries made for the Pittsburgh Survey in 1908 by Alois B. Koukol, secretary of the National

Slavonic Society, and Peter Roberts, secretary for immigration of the International Y. M. C. A., indicated that such was the case. By securing explicit legal evidence, and centering his fire on the two petty tribunals which harass the people of the Kingsley House section, Mr. Matthews has reopened the case against the system in a way which cannot be dropped. It is a piece of fearless neighborhood work which ought to mean much for the city and the state.

JUDICIAL ASSIGNMENTS TO CHILDREN'S COURTS

Chief Justice Isaac Franklin Russell of the Court of Special Sessions, New York, has shown that he possesses a quality which is even rarer than that of efficiency, that of being willing to reconsider and modify an administrative act which on further reflection he finds to be unwise.

THE SURVEY of October 1 considered at some length the assignment of judges to the Children's Courts in New York under the provisions of the legislation enacted at the last session, taking effect September 1. We expressed regret that the new assignments offered no substantial change from the monthly rotation of judges which had formerly prevailed in the Manhattan Children's Court and, in the main, changed the system in Brooklyn from a bi-monthly rotation to a monthly rotation—in our judgment a backward step. We expressed the view that these assignments were not only in themselves unfortunate, but were in conflict with the spirit and apparently with the language of the new law.

On October 10 Chief Justice Russell cancelled the assignments for 1911 and promulgated new assignments in which the principles of continuity of service for a reasonable term and assignment for special fitness received much greater recognition. The original assignments and the new assignments are indicated in the table below.

It will be observed that Chief Justice Russell has reduced the number of different judges assigned to the Manhattan Children's Court from six to three; the number assigned to the Brooklyn court from six to three, and the number assigned to Queens and Richmond from eleven to seven. The total number of

Assignments of Justices to the Children's Courts.

By original assignments	13
By new assignments	9

different justices assigned to the children's court service is reduced from thirteen to nine.

In continuity of service also there is improvement. In the Manhattan court there are but three assignments of one month each as compared with six in the original schedule, and there is one assignment for a period of three months as against none in the former schedule. In the revised schedule for Brooklyn, there is one monthly assignment as compared with eight in the previous schedule, and there is also one assignment for three months as against none in the earlier schedule. The assignments to Queens and Richmond, however, are still in the main on a monthly basis, although the number of different judges is reduced from eleven to seven.

It is our conviction that the new assignments will greatly improve and strengthen the work of the Manhattan and Brooklyn Children's Courts. The judges selected have shown a special interest in juvenile work and each of them has acquired an extended experience.

The volume of work in the Manhattan Children's Court (12,000 cases a year) presents a problem much more difficult than in any other juvenile court in the land. It may be that a satisfactory solution will only be found in a division of the court or in the establishment of a series of children's courts entirely separate from any connection with any court for adults. We hope, however, and we believe, that experience will demonstrate that a sitting of three months is not only practicable, but that a considerably longer term of service is entirely practicable, even with the present volume of work.

The enormous number of cases makes it more difficult, but not less essential, that ample and favorable conditions be secured for the careful consideration of the condition and needs of each child. There is nothing essentially new in the juvenile court movement. There is no panacea in a juvenile court which in any respect whatever takes the place of, or renders unnecessary, a careful study of the circumstances and necessities of each individual child. Multiplicity of cases should not excuse superficial consideration. Snap judgments in relation to 12,000 cases would be just twelve times as bad as snap judgments in relation to 1,000. Continuity of attention for each of the 12,000 children coming before the Manhattan court is just as necessary as for each of the smaller number of cases coming before the Brooklyn, Boston, Cleveland, Chicago or Denver juvenile court. In fact, the evils of frequent rotation tend to increase in nature, as well as in volume, as the number of cases increases.

In the degree of control over the Children's Courts in New York which the new law vests in Chief Justice Russell, he has an opportunity such as perhaps has never before come to a judicial officer to break new ground and establish new standards in juvenile court work in the metropolis. The responsibility is measured by the opportunity. We trust that Judge Russell will acquaint himself with the methods and the procedure of the various juvenile courts in different cities; that without following too closely any one model, either of the courts heretofore established in this city or of those established elsewhere, he will build up a series of children's courts in the four counties comprising the city of New York which will make a contribution to the development of the juvenile court work in this country such as should be made by its greatest city.

We are forced, however, to point out that the assignments to the Children's Court of Queens and Richmond counties are still on the basis of a much more frequent rotation than the law seems to us to contemplate. We confidently expect also that the revision just made is only the first of a series of steps toward greater continuity of service. We are confident that experience and study will lead Justice Russell to favor assignments for still longer periods. Especially, it would seem desirable that when a judge is to sit two or more months in the Manhattan court during the year, his service should be continuous, and not as in some cases even in the revised assignments, broken into monthly periods.

JOURNAL OF CRIMINAL LAW

The most valuable achievement thus far of the American Institute of Criminal Law and Criminology, whose recent convention is reported in this issue of THE SURVEY, is the establishment of a bi-monthly journal which has made clear in its first three issues the important place it is to fill in the movement to secure a better administration of criminal justice. That such a periodical has been needed is evident from the statement in its initial number, that heretofore there has been nothing of the sort in the English language although some thirty or forty are published to serve the countries of continental Europe and even India and South America.

The *Journal* aims not only "to extend interest to the study of questions relating to the administration of the criminal law," but to advocate reforms in penal methods "to the end that a more effective, speedy and inexpensive system of criminal justice may be secured, more modern and effective methods of dealing with criminals may be introduced, and the causes of the present widespread and increasing popular dissatisfaction with the administration of the criminal law may be removed." Further assurance is given that it will encourage and advocate legislation looking toward better records, statistics and other information relating to the causes, nature and punishment of crime.

The editorial board, like the membership of the institute, recognizes the joint interest of sociologists, psychologists, students of political science, and practical social workers, with the legal profession, in solving the problems to which the *Journal* is devoted. Associated with the editor-in-Chief, James W. Garner, professor of political science in the University of Illinois, are representatives of all these lines of thought and effort.

The thoroughgoing scientific standards which the *Journal* sets before itself in going about its task are well shown by the stress it places upon the necessity for reliable statistics in establishing a fundamental basis for real discussion and progress. The utter inadequacy of the statistics of crime in this country is insisted upon in several articles; one of them being in fact an indictment against all our social statistics as "scarcely worth the name." Its very zeal may be taken in goodnature as a sufficient offset against its sweeping academic qualities.

The admitted inadequacy of our criminal statistics, however, indicates the more clearly the great service which the *Journal* should render as a steadying influence in a field in which discussion is peculiarly apt to go wide of the mark. This responsibility in thus representing the consensus of authoritative opinion demands a scrupulous accuracy on the part of editors and contributors. As the *Journal* settles into its work, there should be less possibility of such slips as that in the first number —an editorial reference to "the excellent work" done in the past by the New York Juvenile Court, based merely upon the annual report of the clerk of the court, when even a superficial enquiry would reveal the criticism which nearly all leaders in probation have directed toward the methods and system which circumscribed the usefulness of this particular juvenile tribunal;—as that in the third number where we find an editorial heading which attributes certain "ideas on the treatment of convicted criminals" to a man whose quoted speech merely reiterates the language of an article written much earlier by another man.

Timeliness characterizes the *Journal's* reporting of interesting and significant developments in its field. Court decisions, new laws, administrative orders and noteworthy papers or utterances are promptly cited, and most valuable features are the current bibliography and book reviews. It is to be hoped that the chronicle of current events will involve early reports on experience under various new methods. For example, it would now be most valuable to have careful statements of the results under Mayor Gaynor's police reforms inaugurated a few months ago and reported in the second issue of the *Journal*.

Rarely has a periodical devoted to a special field of social reform started with more influential and authoritative backing or with greater opportunity to render service of large importance.

THE AMERICAN PRISON ASSOCIATION[1]

O. F. LEWIS

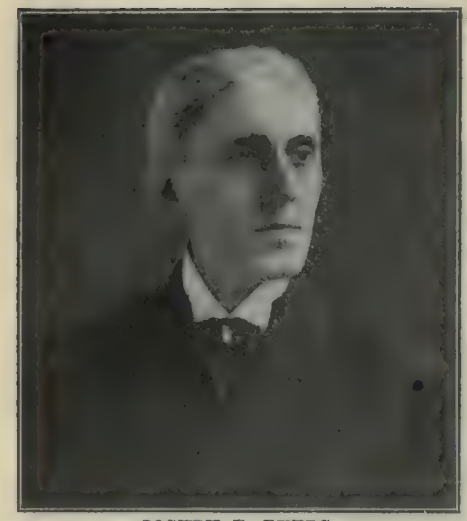
SECRETARY, PRISON ASSOCIATION OF NEW YORK

At the meetings of the American Prison Association papers are read and discussed; at those of the International Prison Congress papers have already been prepared and printed and are summarized by a "reporter", his report furnishing the basis for discussion and eventual resolutions. Adherents of the former method will probably not declare themselves as yet persuaded that the European plan is the wiser. Certainly, many will feel that resolutions drawn on the basis of a single report and an hour's discussion often run the risk of being framed with far less deliberation than is necessary in the case of principles which have been subject to the test of years. Realizing this difficulty, neither the American Prison Association nor the National Conference of Charities and Correction is a "resoluting" body. Nevertheless, it is certain that the reports of the committees of the American Prison Association carry great weight in the moulding of public opinion.

Significant at the outset was the presidential address of Amos W. Butler of Indianapolis. Speaking on Convicts and Conservation, he emphasized the enormous waste of "convict resources" now occurring in many parts of the United States through keeping prisoners in idleness or but partially employing them. Mr. Butler declared that no present system of prison labor is in all important respects successful. He advocated the extension of the system of state farms now profitably conducted in the South.

Whenever a new prison is to be constructed, the authorities should buy ample land upon which to erect it—not less than an acre for each prisoner, counting the maximum population. Why, since prisoners make again habitable the abandoned farms of Massachusetts and remove the boulders from

The November magazine number of THE SURVEY will be an International Prison Congress number. It will include several of the important papers, reviews of the different meetings on criminal law prevention, etc.; a series of impressions of American conditions by Dr. Simon van der Aa of Holland and sketches of several of the foreign delegates by Isabel C. Barrows. In this issue we print brief reviews of the two national organizations which met in Washington just before the International body.



AMOS W. BUTLER.

Secretary of the Indiana Board of State Charities, retiring president of the American Prison Association.

the rich soil of Rhode Island, can they not reclaim the tide flats of New Jersey and the Everglades of Florida? If prisoners build dykes in Europe and levees in Louisiana, why not elsewhere? In Europe the courses of streams have been changed, mountains tunnelled, and canals built by prisoners. In the great mountain districts of the United States, in the lands of disappearing timber and along our sandy shores, there are possibilities already without limit. With selected prisoners under the right kind of supervision, what could not be done? These suggestions provide for the very least competition with free labor, for doing something good at the state's expense.

Indeed, emphasis throughout the meetings and at the succeeding International Prison Congress was laid on the necessity of combining the principle of reformation with the principle of reasonable work. When President Taft received the members of both bodies at the White House, he considered it his duty to warn the delegates that they should avoid making prisons so attractive and comfortable as to furnish a motive for desiring incarceration. It is undoubtedly true that this motive is sometimes present in the case of those committed to the idleness of common

JOSEPH P. BYERS.
Superintendent of the New York House of Refuge, re-elected secretary of the American Prison Association.

jails and to the half-administered industries of some county penitentiaries, but that prisons and reformatories throughout this country are being made attractive through luxuries and sentimental treatment is greatly to be doubted. One must surely agree with President Taft's statement, that prisoners are not properly trained and used if, by associating with hardened criminals men who are not criminals and who may be saved altogether from becoming criminals, the number of criminals is increased rather than diminished.

One of the principal underlying themes of the association's meeting and of the International Prison Congress was the problem of the short sentence man. Fully recognizing for many years that reformatories and prisons are fed from the lesser prisons far more abundantly than might be the case were reformatory and preventive measures more largely present in workhouses, jails and houses of correction, the discussions of the American Prison Association centered upon the problems of proper discipline within prison walls and with subsequent supervision and rehabilitation of the prisoner on release. An able paper was presented by James A. Leonard, emphasizing the duty of society to give to the released man a "square deal" and a helping hand. "Severe methods of punishment have been largely discredited in American reformatories", said Dr. Leonard. "Almost every American reformatory is operating under some modified indeterminate sentence law. The young criminal can be made to stand secure when released from prison only after his feet rest upon the rock of economic independence."

In the discussion following Dr. Leonard's report, J. P. Gilmour, warden of the Central Prison at Toronto, Canada, told of 150 convicts serving sentences on a farm under his supervision where there is no bolt, bar nor gun. Mrs. D. A. O'Sullivan, superintendent of the Mercer Reformatory, Toronto, pointed out in a forcible speech the difficulties in after life of the reformatory girl who is often looked upon as legitimate prey for unscrupulous persons.

Frederick G. Pettigrove, chairman of the Prison Commission of Massachusetts, thought that prison officers should have clear heads and warm hearts. "They should be able to think straight rather than to shoot straight. Any prison system that depends upon the shot gun belongs to the bottomless pit and should be consigned there as soon as possible. Don't shoot a prisoner trying to escape, for he will be captured in time, but shoot him if he tries to assault his keeper or other prison official."

In the belief of Joseph F. Scott, superintendent of Elmira Reformatory, prison officials should be selected from the civil service. As regards the prisoner, he said that "while a prisoner is doing the work assigned to him, he should be made to do it for all he is worth. When, after hours, he is resting, and this time is to an extent his own, he should be encouraged with kindly consideration."

One of the most interesting sessions was held under the leadership of George W. Benham, warden of the New York State Prison at Auburn. Mr. Benham, reporting for the committee, said that the average prisoner aims to obey the rules. Prison discipline in general should be applied to all alike but, nevertheless, every individual's peculiarity must be studied. A strong effort should be made to reduce the minimum of those among the prison population who prove to be immune from any reformation or

improvement. Men of the incorrigible class should be segregated from the balance of the prison population, and placed in a separate building containing a sufficient number of light, well ventilated, roomy cells, each connected with an enclosed yard of such size that the prisoners may be kept at some employment and not suffer impairment by isolation. These quarters should also be used for the temporary confinement of prisoners who break prison rules, thus permitting the abolition of the unsanitary, dark cells now used in many prisons. Mr. Benham said:

> The chief influences that have entered into the improvement of the conduct of prisoners are the indeterminate sentence and commutation for good behavior laws. These, together with the merit and reward ideas of inducing good order have, in the committee's opinion, accomplished much more during their short period of existence and have sent more men from prison with a clean record than the thousands upon thousands of brutal lashes from the "cat", and the millions of hours of repugnant and spirit-breaking methods, which have been inflicted in the years gone by. The use of striped uniforms and the lock step is humiliating. The theory of any benefit arising from their use is wrong. The foundation stones of successful results in prison discipline are fairness and integrity on the part of the managing officials, labor, simple food prepared in a clean and wholesome manner, clean and substantial clothing, cleanliness of beds and surroundings, education and religious instruction.

In a genial but earnest manner, Albert H. Hall of Minneapolis, made the radical suggestion in the report of the committee on criminal law reform, that Bertillon measurements and photographs of every citizen should be made and filed in a central bureau for public record. "The United States government ought to make it its chief concern to discover, develop, and realize itself, by gathering and recording full biographic and civic data of every man. We have developed the registration and identification of domestic animals. Why omit the record of human life, the supreme product of creation? The task is not impossible. Its benefits would be incalculable and far-reaching." Mr. Hall made the further suggestion that criminal statistics in the United States should be far more adequate and comprehensive than they are at present. He called attention to the pressing need of an expert criminal legislation bureau equipped with all available statistics. Another suggestion was that examining magistrates in criminal offences be clothed with authority to take a stenographic record of the examination of the accused, a copy to be furnished to him.

Very interesting was the report of the committee on discharged prisoners, made to the convention by F. A. Whittier, superintendent of the Minnesota State Training School for Boys. The recommendations of the committee were wholly in line with the principles above outlined and were corroborative evidence of the strength of the principle of parole, official supervision, and friendly aid to the man released from prison.

George L. Sehon, superintendent of the Kentucky Children's Home Society, laid stress in his committee report upon the fact that the child of today must be developed into a real asset for the society of tomorrow. All wholesome agencies are helpful preventives in the lives of the nation's dependent children. State and national governments have been entirely too lax in their treatment of parents. Adequate punishment should be provided for every man who fails to exert every effort to the support of his family and the proper training of his children. State aid, in the shape of

O. F. LEWIS.

Secretary of the New York Prison Association, who was in charge of the publicity.

pensions, or in some other form, should be forthcoming for the widows, who, because of their poverty, are unable to raise their children above the level of dependence. Mr. Sehon, supported by a majority of the members of the committee, endorsed the principle of vasectomy, a conclusion from which Judge William H. DeLacy of Washington, a member of the same committee, dissented vigorously.

On October 2, a joint meeting was held of the American Prison Association and the International Prison Congress. Amos W. Butler, president of the American Prison Association, presided. The venerable Z. R. Brockway of Elmira, N. Y., who was one of the speakers, held that "the real sacrilege of the work for the reformation of criminals consists in unwarrantable ignorance, selfish indifference, superficiality, falseness, and failure to recognize and work with the mysterious underlying forces that make for righteousness."

A banquet, noteworthy in its dignity and influence, was tendered the foreign delegates on Tuesday, October 4, at the New Willard Hotel by the American Prison Association. About 300 covers were laid. Frederick H. Mills of New York was toastmaster. Responses were made by representatives of many lands. As a testimonial by American penologists of their respect and regard for their foreign colleagues, the banquet was a notable success. A valuable tea service was presented by the foreign visitors to Mr. Mills, who had been in charge of the tour of inspection as representative of the United States government.

Dr. Guillaume, secretary of the International Prison Congress, who has attended every session of the congress since its institution forty years ago, declared that the organization owes its origin to America. "The United States," said he, "will become the Holy Land of philanthropists the world over." Major R. W. McClaughry, warden of the United States Penitentiary at Leavenworth, Kan., urged that means be devised to prevent the law's delay. A noteworthy speech was that of Sir Evelyn Ruggles-Brise, in which he emphasized the great need of the centralization of the administration of correctional institutions and the greater care necessary in the humane and reformatory treatment of short sentence men in American jails and workhouses.

The limits of space alone prevent the presentation here of a number of discussions and addresses. The general conclusion of those attending this year's conference was that "the conference was at a high-tide level." Credit in abundant measure is due to the officers of the association for the valuable series of meetings and the excellent arrangements at Washington. It is not under-emphasizing the valuable help rendered by many members of the American Prison Association to make this recent meeting a success, to speak a special word of commendation for the services of the general secretary, Joseph P. Byers.

The 1911 meeting of the association will be held at Omaha, Neb., the time to be determined by the executive committee.

The officers chosen for 1911 are T. B. Patton of Huntingdon, Pa., president; James A. Leonard of Mansfield, Ohio, Governor A. W. Gilchrist of Tallahassee, Fla., Demetrio Castillo, Havana, Cuba, Lieut.-Col. A. Irvin of Stone Mountain, Canada, vice-presidents; Joseph P. Byers of New York, general secretary; H. H. Shirer, Columbus, Ohio, financial secretary; Frederick H. Mills, New York, treasurer.

THE AMERICAN INSTITUTE OF CRIMINAL LAW AND CRIMINOLOGY

HARRY E. SMOOT
ATTORNEY CHICAGO JUVENILE PROTECTIVE ASSOCIATION

The second annual conference of the American Institute of Criminal Law and Criminology was arranged to come between the meetings of the American Prison Association and the International Prison Congress so that the members of

these bodies might attend the meetings of the institute. The institute is the outgrowth of a conference on criminal law and criminology held in Chicago in June of last year in celebration of the fiftieth anniversary of Northwestern University Law School. The conference last year selected from a proposed list of topics six questions which were assigned to committees with instructions to study, investigate and report upon them at the next conference.

The president, John H. Wigmore, professor of law at Northwestern University, said in his address:

> The obvious benefit and need of that work (the work of the institute) is seen in two ways: general organization of workers, and research in specific problems of the day.
>
> First, the organization of the workers has brought all the natural benefit of organization. Many important workers hitherto isolated, have been found out and brought into touch. All workers have been encouraged by the consciousness of co-operation. The efficiency of all the laborers has been multiplied. Wasteful and misdirected labor has been prevented. Public interest and confidence have been confirmed and stimulated. Without organization these things must have lingered or failed.
>
> The local organization needed for influencing state law and practice has also been stimulated. State conferences have been held in Wisconsin and in Kansas. During the first year of our existence this feature has not been emphasized as it must be in the future. But, for this purpose, strong men must arise in each state who will lead the work. The states of Pennsylvania, New York, Illinois and Missouri have a special duty in this respect, and that duty has not yet been realized.
>
> Next, tangible results have been reached or hastened in the specific problems of our field. Nine working committees were appointed including over seventy workers. Of these nine, seven have reported. Of these seven, the work of one stands completed, the committee on the establishment of a journal. The journal is the breath of life of the institute. It is in the ablest hands; its pages will serve as a perpetual organ for the spread of principles.

The *Journal of the American Institute of Criminal Law and Criminology* was established by a committee by virtue of a resolution adopted by the institute which called attention to the fact that there was no periodical in the English language devoted to the scientific study of criminal law and criminology although some twenty-five such journals are published in foreign countries including Austria, Belgium, France, Germany, Italy, Netherlands, Russia, South America, Spain and Switzerland. The first number of the *Journal*, which is published bi-monthly, was issued in May.

The committee on translation of European treatises has already done much of its work. The resolution of the institute calling for the appointment of this committee recognizes that "it is exceedingly desirable that important treatises on criminology in foreign languages be made readily accessible in the English language." President Wigmore says of this committee that it "has let the contracts for translating nine most representative works. These will bring our whole thinking public into touch with the best European results of theory and practice. Two of these are almost off the press and others are actually in course of translation." The committee reports that "it realizes the necessity of educating the professions and the public by the wide diffusion of information on this subject"; that "the legal profession in particular has a duty to familiarize itself with the principles of that science as the sole means for intelligent and systematic improvement of the criminal law"; and that "one of its (the institute's) principal modes of stimulating and aiding this study (of modern criminal science) is to make available in the English language the most useful treatises now extant in the continental languages." As a result of the labors of this committee, the Modern Criminal Science Series has been started, which comprises the works spoken of in President Wigmore's report.

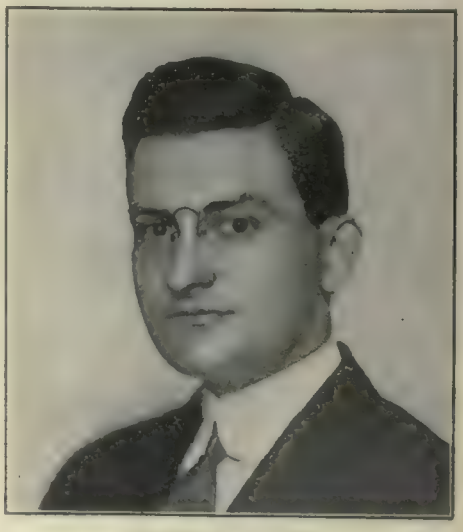
The works now being published are Criminal Psychology by Hans Gross; Modern Theories of Criminology by Bernaldo de Quiros; Criminal Sociology by Enrico Ferri; Individualization of Punishment by Raymond Saleilles; Crime, Its Causes and Remedies by Cesare Lombroso; Penal Philosophy by Gabriel Tarde; Criminality and Economic Conditions by W. A. Bonger; Criminology by Raffaelle Garofalo; Crime and Its Repression by Gustav Aschaffenburg. The series will be pub-

JOHN H. WIGMORE.

Dean of the Law School, Northwestern University, retiring president of the American Institute of Criminal Law and Criminology.

lished by Messrs. Little, Brown and Company, Boston.

American readers are indebted for access to these works to the American Institute of Criminal Law and Criminology which secured the authorization of the writers in the series and made arrangements for special copyrights. Each work contains an American preface by the author and there will be special introductions by recognized authorities.



The committee on system of recording data of criminality had for its subject the "investigation of an effective system for recording the physical and moral status and the hereditary and environmental conditions of delinquents and in particular of the persistent offender; the same to contemplate in complex urban conditions, the use of consulting experts in the contributory sciences." In his report, the president said of this committee that it "has reported a system which is the ideal result of expert consultation. There remains the duty of testing this system in practice." The system reported by this committee comprises for the most part the schedules used by Dr. William Healey in the Juvenile Psychopathic Clinic of Chicago. These schedules are being used by the judges in a number of courts, both juvenile and municipal, in different sections of the country.

Other important topics worked upon during the year and reported at the last conference are, Organization of Courts, Criminal Procedure, and Criminal and Judicial Statistics.

Dean John D. Lawson of the University of Missouri Law School and Edwin R. Keedy of Northwestern University Law School reported on a special investigation in England on Criminal Procedure. This report, the most exhaustive yet made on the subject, will be published in the *Journal*.

All these committees are to continue their investigations of the subjects assigned them last year and to report again at the next conference.

The sessions of the conference closed with the annual dinner at the New Willard. Judge William H. DeLacy of the Washington Juvenile Court presided. Attorney-general Wickersham, the principal speaker, emphasized the need of changes in our criminal procedure. He contrasted trials of cases in England and in this country to show the degree of control exercised by the English judges. He assured the members that President Taft is heartily in accord with the measures suggested by the institute.

EDWIN R. KEEDY.

Professor of law in Northwestern University, retiring secretary of the American Institute of Criminal Law and Criminology.

The institute authorized the appointment of committees to study during the coming year the following additional topics: "An investigation of the insane offender, with a view first to ascertain how the existing legal rules of criminal responsibility can be adjusted to the conclusions of modern medical science and modern penal science; and secondly, to devise such amendments in the mode of legal proceedings as will best realize these principles and avoid current abuses", and "The alien and the courts with a special reference to the following questions: treaty rights; status under the various state laws; procedure including interpreters, appeals, etc.; deportation for commission of crime; criminal statistics as affected by legal disabilities."

The institute voted that its executive board should have power to accept an invitation on behalf of the International Criminalistic Union to become the recognized unit of that association in this country.

The institute committees will do special work during the coming year on seven different topics, the precise wording of which can be found by consulting the bulletins of the institute or its *Journal*. These topics are the phases of the advanced work now being done by scientific men in criminal law, criminology, penology, psychiatry, psychology and other contributory sciences.

The membership now includes a majority of the men throughout this country who can contribute to the advancement of the science of criminal law and criminology. The institute desires, however, to add to its membership those who may be most benefited by the results obtained or who are in a position to place such results in practical use. Interesting in this regard is the report of the secretary which says in part: "We circularized and sent bulletins to over three thousand of the prosecuting attorneys in this country. At the time I left the work last March we had received but two answers to those circulars; one was an application for membership and the other was a letter of inquiry which was answered but led to no application."

The following officers were elected:

FREDERICK H. MILLS

of New York, financial director of the International Prison Congress.

President, Nathan William MacChesney of Chicago, Ill., former vice-president of the Illinois Bar Association, and commissioner on uniform state laws; first vice-president, William H. DeLacy of Washington, D. C., judge of the Juvenile Court; second vice-president, Edward T. Devine of New York city, third vice-president, John D. Lawson of Columbia, Mo., dean of the law school of Missouri University; fourth vice-president, Adolf Meyer of Baltimore Md., professor of psychiatry in John-Hopkins University; fifth vice-president, Charles F. Amidon, judge of the United States Court for the District of North Dakota; treasurer, Bronson Winthrop, New York city, member of the New York bar; secretary, Harry E. Smoot of Chicago, attorney for the Juvenile Protective Association.

Executive Board, Amos W. Butler of Indianapolis, Ind., former president of the American Prison Association; Frederic B. Crossley of Chicago, librarian of the Gary Library of Criminal Law and Criminology; Charles A. Ellwood of Columbia, professor of law in Missouri University; Eugene A. Gilmore of Madison, Wis., professor of law in Wisconsin University; Harry Olson of Chicago, chief justice of the Municipal Court; Arthur W. Towne of Albany, N. Y., secretary of the State Probation Commission; John H. Wigmore of Chicago, Ill., professor of law in Northwestern University; William E. Healey of Chicago, director of the Juvenile Psychopathic Institute; Roscoe Pound of Cambridge, Mass., professor of law in Harvard University; Frederick W. Lehmann of St. Louis, Mo., former president of the American Bar Association.

THE SOCIAL ASPECT OF CITY ECONOMY

JAMES P. HEATON

New York city is going through the annual throes of a budget campaign. That the city government plays the most important part in the plans for social betterment may be little thought of by most people, but it is increasingly recognized by various organizations interested in special phases of social work. Each year their directing officials scrutinize most carefully the municipal activities, in so far as these affect their particular fields.

So long as there are unsupervised cases of tuberculosis in the tenements, 100,000 dark, windowless, interior bedrooms and sick and helpless patients in city institutions who are subjected to the care of incompetent employes, social workers cannot watch with equanimity the purchase of expensive automobiles for city officials, and the waste of public funds in excessive prices paid for real estate and extortionate fees to commissioners in condemnation proceedings. Social workers have felt compelled to face the facts and to try to make the community choose intelligently the purposes for which its money shall be expended.

The present administration of New York city has attracted nation-wide attention for its creditable efforts to make sure that the municipal funds are not needlessly wasted through lack of ordinary business foresight and efficient oversight. The determination of Mayor Gaynor and his fellow officers that the public shall be told the whole truth and nothing but the truth as to the expenditure of the public funds is a much appreciated phase of official frankness.

All over the country, however, social workers are wondering whether the city officials in their anxiety to economize will fail to furnish the funds necessary for the improvement of the service rendered by such departments as education, charities, correction, health, tenements and parks.

The most interesting new departure this year has been the municipal budget exhibit which the city is maintaining this month. A budget exhibit was given two years ago by the Bureau of Municipal Research. With a special appropriation of $25,000 and the co-operation of all the city departments a much more complete exhibit has been prepared than the bureau was able to arrange. The exhibit has been splendidly advertised. Every taxpayer was notified by an invitation enclosed with his bill. A large sign was placed on Brooklyn Bridge where it crosses Park Row that makes advertising men enviously wish they could have such a space for the benefit of their clients.

Part of the carpentry work necessary for the installation of the exhibit was performed by the boys of the Vocational School as a practical illustration of the value of some of the so-called "new fads" of the Board of Education. The Fire, Police and Street Cleaning Departments have very attractive exhibits consisting largely of samples of the material equipment for their work. The Department of Water Supply, Gas and Electricity, the board in charge of the new Catskill water system, and the borough presidents also have a chance to appeal to the eye by showing graphically the vastness of their construction works, such as sewer and water mains. The Department of Public Charities shows furniture made by the feeble-minded children on Randall's Island, Bellevue Hospital illustrates the method of bringing in ambulance patients, the Tenement House Department has models of fire escapes and tenement buildings and the Department of Correction displays examples of articles made by those confined in the workhouse.

Some of the exhibits which attract attention are not so spectacular. The chart of the Finance Department showing the amount of provisions condemned by inspectors from the consignments intended for charitable institutions, and the saving in coal bills due to buying by heat units

instead of weight are examples. The false measures and weights found by the city inspectors make a sad commentary upon the honesty of some dealers.

The exhibit shows well how the money is spent and how it is being saved. An omission is the failure to show as clearly how the funds spent are raised. The sources of revenue now used and those that might be employed are not explained nor are the effects of the present methods of raising money. The uniform note of the budget exhibit is that every effort is being made to use money economically and that larger sums could profitably be employed.

Although the administration came into power on a platform of economy, the department heads, with two or three exceptions, notably the borough presidents of Manhattan, the Bronx, the comptroller and the commissioner of correction, all submitted requests for rather substantial increases.

The Board of Estimate and Apportionment, hoping to keep the budget down to the total for last year, requested that the departmental heads submit revised estimates amounting to ten per cent less than the sum allowed to them last year, together with an explanation of the effects upon the service that would follow. The increase in fixed charges for the debt service, and mandatory increases in salaries force an economy of $7,000,000, if the budget is not to be greater. Social workers have been very anxious that such cuts should not be applied to the departments with whose needs they are thoroughly acquainted. The seriousness of the blow should that be done, which, however, is not probable, is apparent to all familiar with the needs of the Departments of Health, Charities and Education. It would be a serious handicap if these departments get merely what they enjoyed or endured last year. At this time it is impossible to say what the final outcome will be.

As in past years the estimates and their revisions have come in late. The Board of Estimate and Apportionment postponed the public hearings scheduled for October 13 and 17 and apparently everything will be done in a rush in the last week or ten days as before. This is one matter in which it was hoped that an improvement would be realized.

The Department of Health has asked for a little over $4,000,000 or an increase of over $1,300,000. Of this $316,000 is to enable the department to get 266 additional nurses and 48 medical inspectors so that they can examine the children in all free schools and care for newly born babies and their mothers. The Bureau of Child Hygiene has demonstrated its value and its work is being watched with approval all over the country. The other large increases requested are $115,000 for the division of contagious diseases, for new inspectors; $488,000 for the division of hospitals, and $96,000 for the tuberculosis sanatorium at Otisville. This last is particularly needed to follow up the good work in stamping out tuberculosis to which the department has devoted so much attention this past year. Minor increases that are very desirable are $51,000 for improved milk inspection and $12,000 for the Bureau of Records which is in need of a thorough reorganization. None of these needs can be adequately met if an increase is not granted the Health Department. The department requires generous funds to perfect further the system of visiting consumptives monthly in their tenement homes, of inspecting the patient in every new case of tuberculosis reported, and of guarding the dismissal of tuberculosis patients from the hospital to homes where conditions are not proper for their reception. The department would also like to open milk stations to take the place of those closed by Mr. Straus.

The Department of Education requested $35,970,000, or an increase of $7,309,000. The increases of most interest to social workers are $171,000 for evening schools and $96,000 for vacation schools, playgrounds and recreation centers and baths. Last year it was necessary to postpone opening three new evening high schools, to curtail the number of truant officers employed and to reduce greatly the sum for vacation schools, playgrounds and evening recreation centers. If the increases asked for these are allowed the sum spent will be

less than the cost in 1909. The board seems to have made effective economies in the sum allowed for supplies and is asking for 1911 $228,097.43 less than it had in 1906 for this purpose.

The Department of Public Charities, which has the management of most of the city hospitals as well as the care of homes for the aged and infirm, asked for an increase of $1,035,000. Of this, $327,000 is for the salary roll, partly for new employes and partly to increase salaries and especially those of helpers. It is proposed to pay every helper at least twenty dollars a month whereas at present the majority in the City Home get but fifty cents a day or fifteen dollars a month, and many less.

Often helpers really do the work of nurses and are paid with due allowance for maintenance $300 a year less than street sweepers. In the Metropolitan Hospital eighty-seven per cent of the employes get less than $480 a year which is the maximum for the helper grade. At the Kings County Hospital there are ninety-six unpaid helpers of whom the grand jury has said, "It is not proper that the sick should be treated and attended by convalescents, many of them from the alcoholic and venereal wards. Every year, as a result of the poor quality of the hospital help, more attendants are dismissed (2,620) than the average number of employes in the department (2,448) and the total number leaving the service each year is almost double the number in the department at any one time. The underpay of the lower grades of the hospital service has been a disgrace to the city for years and a cause of neglect of its patients."

The department needs more employes for the following new buildings that have been or are to be opened during the year:

(1) Two new hospital pavilions for tuberculosis patients at the Metropolitan Hospital, having a capacity for 350 patients.
(2) A new neurological hospital pavilion opened for patients last June with a capacity for eighty patients.
(3) New nurses' home, Kings County Hospital.
(4) A new wing to Kings County Hospital to accommodate 150.
(5) Two new dormitories for inmates at the farm colony, 100 inmates each.
(6) Insane pavilion at the farm colony.
(7) New staff house, Metropolitan Hospital.
(8) Morgue and pathological building, Metropolitan Hospital.
(9) Morgue and pathological building, Kings County Hospital.

The department is also under obligation to establish branches of the Dependent Adults Bureau in the domestic court buildings, and needs additional employes for other purposes.

The need for these new buildings, which are all practically ready for occupancy, is undoubted. At the Metropolitan Hospital there are at least 200 patients more than can properly be cared for in the present buildings. Small rooms originally used for cells and hardly large enough for one person hold two patients. Beds are so close together that it is impossible to walk between them and patients have had to be put in dark corridors. The State Board of Charities has but recently called the attention of the city authorities to the insufficient air space in the city hospitals.

At the City Home for the Aged and Infirm on Blackwell's Island the superintendent estimates that there is at least twenty-five per cent excess over the proper capacity. In the Brooklyn home there is "no place for the old women who are too weak to go up and down stairs and out on the grounds, to promenade or sit down in comfort. In case of a serious fire only a miracle could prevent a serious loss of life," said the grand jury. The extension of the farm colony is planned to relieve the overcrowding in the other homes. It will enable the city to care intelligently for the more able-bodied on a farm where they can be grouped wisely and employed in agriculture to the extent of their ability.

The new nurses' home at the Kings County Hospital will enable their removal from the isolation building, thus giving more room for caring for contagious cases and allowing the helpers to be removed from an unwholesome basement dormitory.

In private hospitals there is at least one nurse for every four patients, while in the Kings County Hospital the ratio

is one to eight. As a result nurses are compelled at times to work until twelve, one or two at night and then must go on duty again at seven.

For supplies the department has asked for an increase of $175,000. This is needed, for the allowance for 1910 was a decrease of $125,000 from the actual expenditures for 1909. The sum requested is but $14,000 over the amount already allowed for 1910 if the supplemental issues of revenue bonds are considered. The need for a larger appropriation to meet the rising cost of food supplies is very evident.

For repairs an increase of $461,000 is requested. Some criticism has recently been made of the way the department prepared the estimate of its needs for this purpose, but the condition of the buildings, which have been much neglected, is well known, and although this item can possibly be postponed in part a very substantial sum should be allowed.

The Park Department for Manhattan and the Bronx requested increases of $52,000 for playgrounds for salaries and wages, $38,537 for bathhouses and comfort stations, and $7,965 for children's farm schools. These are all items that social workers would be glad to see granted. A cut of ten per cent would mean the closing of half a dozen playgrounds. The Tenement House Department has asked for a modest increase of $27,127.50, of which two-thirds is for increases of salaries of present employes. The main question involved is whether the employes in question, most of whom deserve the increases, and many of whom have chances to go to other departments or to private positions at increased salaries, should be required to wait over a year at least until the committee on standardization is able to revise the salary schedules for the city.

The Department of Correction distinguished itself by submitting an estimate calling for $2,776.50 less than it received last year. The saving is entirely in the item of supplies. For salaries an increase of $22,449 is asked. Much of this is mandatory or already authorized by the Board of Estimate and Apportionment.

The attempt to economize ten per cent in the running expenses of the city is an aim that all must approve. Such an economy cannot wisely be effected by making an arbitrary horizontal decrease in the appropriation for every department irrespective of the demonstrated needs of each. Increases should be allowed to some and others may possibly be cut even more than ten per cent. Some of the departments undoubtedly need reorganization to get the fullest work from their present appropriations. This could perhaps be done most easily by refusing any increase which complicates the work of reorganization by making it necessary to start new kinds of work. This view should not prevail to the extent of making the inmates in city institutions and the sick wait for needed services until such time as the office arrangements of the department can be perfected.

COMMUNICATIONS

CHICAGO SCHOOLGRAMS

To the Editor:

Dear Sir.—On page 99 of the issue of The Survey for October 8, I find some of the "schoolgrams" offered by the Chicago Health Department. They are all good and I believe will be very helpful, but the last one staggers me. It says, "Be well, and you'll be happy—even in school." Of course, it is an oversight.

Isn't it rather a serious condition of affairs when the writer of such good advice, who evidently understands his problem as thoroughly as this writer does, feels it necessary to tell a child that he may even be happy in school!

IMPORTANT NEW BOOKS ON PRISON REFORM

UNDER the title Correction and Prevention, the Russell Sage Foundation has issued a set of four books which show admirably the essential features and principles of American methods of dealing with crime and criminals. They follow the four sections of the International Prison Congress held this month in Washington: Penal Legislation; Prison Administration; Preventive Means; Questions Relating to Children. Written by experts, edited by Prof. Charles R. Henderson of the University of Chicago, the President of the International Prison Congress, well printed and profusely illustrated, they form an indispensable source of accurate information and give a rounded view of the subject such as can be obtained in no other printed form. The foreign delegates to the Prison Congress found the books of the greatest value. The books may be bought separately at the prices named under each one below, or the FOUR WILL BE SENT EXPRESS PREPAID FOR $10.

PRISON REFORM

Seven chapters in the first part of this volume give in historical and biographical form the story of Prison Reform, told by men still living whose lives have been intermingled with the noblest efforts in this direction.

- Historical Introduction, by Frederick Howard Wines, LL.D.
- E. C. Wines and Prison Reform, a Memoir by Frank B. Sanborn.
- The American Reformatory Prison System, by Z. R. Brockway.
- Possible and Actual Penalties for Crime, by Frederick Howard Wines.
- Samuel June Barrows, by Paul U. Kellogg.
- Rutherford B. Hayes, by W. M. F. Round.
- Biographical Sketches of Francis Lieber, Theodore W. Dwight, Edward Livingston, Dorothea Lynde Dix, Ellen Cheney Johnson, and Gardiner Tufts.

Criminal Law in the United States, the second part of this volume, is devoted to a treatise on this subject by Eugene Smith, president of the Prison Association of New York. He treats of the criminal law not only as it exists in tomes, but as carried out in the punitive system. He has also an excellent chapter on the Indeterminate Sentence and one on Children's Courts and Probation Officers.

320 PAGES. 16 PORTRAITS. PRICE $2.50. BY MAIL $2.66.

PENAL AND REFORMATORY INSTITUTIONS

A volume of papers by sixteen authorities. In an orderly arrangement from the police who arrest to the man set free at the end of his term, there is collected a mass of information, the great value of which can best be judged by the following list of topics and writers:

- Introductory, Charles Richmond Henderson.
- Police Systems of the United States, Richard Sylvester.
- Jails, Workhouses and Police Station Houses, Warren F. Spalding.
- State Prisons of the United States Under Separate and Congregate Systems, Frederick G. Pettigrove.
- Three Prisons Systems of the Southern States of America, A. J. McKelway, D.D.
- American Reformatories for Male Adults, Joseph F. Scott.
- Reformatory Methods and Results, James A. Leonard.
- Reformatory Treatment of Women in the United States, Isabel C. Barrows.
- United States Prisons and Prisoners, Robert V. La Dow.
- Prison Officers and Prison Discipline, Robert W. McClaughry.
- Prison Labor, Joseph P. Byers.
- Educational Work in Prisons: The Prison School, Charles Richmond Henderson; Education Behind the Walls, Rev. Wm. J. Batt; Papers and Magazines in Reformatories and Prisons, Isabel C. Barrows.
- The Prison Physician and His Work: Health and Disease in Prison, Julius B. Ransom, M.D.; The Criminal Insane in the United States, Robert B. Lamb, M.D.
- The Released Prisoner, Amos W. Butler.

350 PAGES. 70 ILLUSTRATIONS. PRICE $2.50. BY MAIL $2.70.

PREVENTIVE AGENCIES AND METHODS

By CHARLES R. HENDERSON, Ph.D.

Under this title the editor of the series has prepared a large book, chiefly from his own pen, embodying the results of his long and careful studies on these subjects in connection with his work as Professor of Sociology in the University of Chicago. He has been assisted by many experts who have carried on research work in various directions. Following is a list of the chapters:

- Inherited Defect.
- Improvement of Physical Conditions.
- Preventive Methods in the Economic Sphere.
- Prevention of Prostitution, Alcoholism, Drug Habits.
- Direct Measures (relating to anti-social persons but outside of courts and prisons).
- Law, Courts and Government.
- Educational Methods of Preventing Crime.
- Agencies of Recreation, Culture and Religion.

440 PAGES. PRICE $2.50. BY MAIL $2.68.

PREVENTIVE TREATMENT OF NEGLECTED CHILDREN

By HASTINGS H. HART, LL.D.

- The Juvenile Reformatory.
- Schools for Delinquent Girls, Mary W. Dewson and Hastings H. Hart.
- Semi-Public Institutions for Delinquents.
- The George Junior Republic, Frederic Almy.
- Public Institutions.
- Private Institutions.
- Study of Fifty Institutions, with Comparative Tables.
- Plans for a Children's Cottage with Outdoor Sleeping Porches.
- The Full Measure of Responsibility in Child-Helping Work, Wm. H. Pear.
- Children's Aid Societies and Children's Home Societies.
- Societies for the Prevention of Cruelty to Children, Roswell C. McCrea.
- Juvenile Court Committees and Associations.
- The Evolution of the Child-placing Movement.
- The Operation of the Placing-out System.
- The Placing-out System: Selection of Homes.
- Supervision of Children in Family Homes.
- The Juvenile Court as a Non-Criminal Institution, Hastings H. Hart.
- The Juvenile Court as a Social Institution, Bernard Flexner.
- The Juvenile Court as a Legal Institution, Julian W. Mack.
- Procedure of the Boston Juvenile Court, Harvey H. Baker.
- Procedure of the Manhattan Children's Court, Franklin Chase Hoyt.
- The Juvenile Court as a Probationary Institution, Henry W. Thurston.
- Juvenile Probation in New York, Homer Folks.
- Study of the Problems of Neglected Children.
- The Study of the Child.
- Social Preventive Agencies.
- Conclusions of the White House Conference.

420 PAGES. 87 ILLUSTRATIONS. 14 PLANS. PRICE $2.50. BY MAIL $2.70.

TWO ACCOMPANYING VOLUMES

The Russell Sage Foundation has published two additional volumes in the same field which are particularly timely and authoritative, and belong on a shelf of the social worker's library hitherto almost unoccupied. These two books are:

Juvenile Court Laws in the United States. Edited by Hastings H. Hart, LL.D., Director of the Department of Child Helping of the Russell Sage Foundation. Containing a summary by states by Thomas J. Homer, a topical abstract by Grace Abbott and the new Juvenile Court Law of Monroe County (Rochester), New York. 8vo; 150 pages; Price $1.50; By mail $1.60.

Cottage and Congregate Institutions, by Hastings H. Hart, LL.D. A handbook for trustees and officers of institutions for children. Particularly useful and practical for those who desire to establish a new institution or to reorganize an old one. 8vo: 135 pages; Price $1; By mail $1.10.

THE COMMON WELFARE

A SOCIAL WORKER ON THE SUPREME BENCH

One of Charles E. Hughes's last days as governor of New York was made the occasion of a most unusual farewell tribute in the capitol at Albany. Marshalled by Homer Folks, who as secretary of the State Charities Aid Association and president of the State Probation Association has been one of the governor's advisers on matters in the field of charities and correction, a group of those who are particularly interested in public health questions gathered to say a final word to "a governor who knows and cares and hopes, and gives us courage to come here and ask for things which we should not have attempted otherwise," as Mr. Almy put it.

Mr. Folks's tribute is paid on another page of this issue. Commissioner Porter, whose Albany experience runs back to Governor Hill, spoke of Governor Hughes's consistent interest in the State Department of Health, particularly "in legislation regarding the pollution of streams, the disposal of mill waste and the drawing of proper and efficient legislative measures for the correction of some of the existing evils." But, beyond these things, which perhaps are more on the routine side of public health work, he emphasized that the governor has "seen clearly the opening of that great door for general betterment. You have believed in clean streets and clean cities, in clean air, clean homes and clean morals. You have believed in decent tenements and efficient factory supervision, in pure foods and pure water, and in the fight that we have had against tuberculosis. You have realized that ignorance and selfishness were great obstacles against sanitary progress, and against these you have waged effective war."

The state campaign against tuberculosis, which the State Charities Aid Association has conducted for three years in a way to make it a model for all states, was briefly outlined by George F. Canfield. He held it impossible to overestimate the value of the governor's support and advocacy of the cause. He gave an impressive review of the tuberculosis legislation enacted during Governor Hughes's two terms. In 1908 was the bill defining the powers and duties of local health officers and the board of health, which made tuberculosis a reportable disease and provided for sani-

CHARLES EVANS HUGHES.
"Hundreds and thousands of lives will be saved if we have a series of governors like Hughes."

tary supervision of tuberculosis hospitals. This is the law which Dr. William H. Welsh of Johns Hopkins University said placed New York in the front rank of the states which are fighting tuberculosis. In 1909 the governor signed the bill authorizing boards of supervisors to establish county tuberculosis hospitals. And this year there was the repeal of the Goodsell bill which had made the location of hospitals practically impossible.

Frederic Almy, secretary of the Buffalo Charity Organization Society, spoke of the 10,000 who die every year of tuberculosis in New York state. "Hundreds and thousands of lives will be saved if we have a series of governors like Governor Hughes," he said. Last year he made it possible for Buffalo to spend $200,000 for a city tuberculosis hospital, and similar bills have become law for Niagara Falls, Elmira, Poughkeepsie and Yonkers. "My view of Heaven," said Mr. Almy, "is a place where we can see things grow, and I wish Governor Hughes could see the results of his deeds in lives that have been saved all over this state. I am sure it would make him blush to know of all the good he has done in quiet, unselfish and unostentatious ways."

LAST WORDS OF GOV. HUGHES'S

The governor replied briefly:

It has always been pleasing to withdraw from controversy and debate and to have the opportunity of consultation with men and women who have no thought but to take the next step forward in bettering conditions of life. You have came here repeatedly to advise with me and I shall take away from the labors of this administration the thought of many happy hours of planning that the people of this state might suffer a little less from the causes of suffering and disease and might rise a little nearer to the attainable condition of wholesome living.

How I wish we could have done more! I leave office not with the thought of what has been done, but with the thought of what I should have liked to do. There are no groups in the community whom I esteem more highly and whose good will I more earnestly wish than those associations of our citizens who are working in our charitable institutions and in promoting philanthropic enterprise.

Speaking particularly of tuberculosis, which he called "a disgrace to our civilization," he emphasized the opportunity for every one to serve.

Here is a chance for the co-operation of all, no matter what their political views may be, no matter what their theories of government may be. I recognize the necessary limitations of governmental action. And here, not only must we have the action of government within its proper sphere, but this must be supplemented by the co-operation of those voluntary agencies which work outside the domain of government. Necessary information can be brought home to those who are in unfortunate circumstances which are remediable, so that they may know that the conditions may be a little less unfortunate by attention to a few simple rules with regard to hygiene and the proper ordering of life and its surroundings. Those who house other people and profess to have some patriotic pride in our institutions, can more clearly realize what they should do in the interest of the entire community in providing decent abodes for those from whom they take rent. Local authorities in our cities must appreciate the importance of securing prompt and full information in regard to cases and the faithful execution of our health laws so that this shall not be a paper program, but a realized advancement. In our counties the boards of supervisors are having opportunity, and should realize the necessity of, improving conditions.

Where governmental action can properly be had, the matter of fundamental importance is to have administration honest and efficient. There is no greater waste than the supplying of departments and institutions which do not realize their intended purposes. There is no surer economy than to have a public institution or department which is essential to the public welfare, so equipped as to do that which it is intended to do. We do not want public institutions and public enterprises merely described in statutes or conducted simply for the sake of making an imposing showing in published manuals of administration, but we want them to represent real work—actual accomplishment, because the men engaged in them are able, single-minded and loyal.

And in closing this informal address of perhaps ten minutes' length, which was in fact, though not in form, his exaugural, Goveror Hughes left this message with the people of New York state whom he had so often taken into his confidence and on whom he had depended for timely and intelligent support of his measures of reform:

The last word I want to say to you is this: This work must find its support in the sentiment of our communities. You cannot

carry it by main strength against the will of the people. The people must be brought to realize what can be done, what is practicable, and support it because they understand it. Every man and every woman who knows the situation can be a conductor of electrical energy and give this movement its needed power. And do not yield to discouragement. The task is so great, the preventable misfortunes of society are so many, the community suffers so much from the visionary on the one hand, and the man who is too practical to see what can be done on the other hand, that frequently there is a sense of discouragement on the part of those who realize keenly what could be done if only more would work together.

As a result of my four years—nearly four years—here, I want to say to all who are interested in any good work in the state, and particularly in this work: Do not permit yourselves to become discouraged. Whatever has in it merit, and will stand debate, and is practicable, will be had in this country if intelligent people present it and discuss it. Have an absolute, abiding confidence in your fellow men.

CIVIL SERVICE FOR PROBATION OFFICERS

Social workers who have been advocating a competitive examination for the twenty-five new positions of probation officer in the lower courts of New York, are much gratified that Mayor Gaynor has decided in favor of it and that the Municipal Civil Service Commission is planning an examination which promises to be thoroughly practical. The effect of the decision to choose these probation officers by competitive examination is of more than local interest.

In disapproving of the proposed exemption of these positions Mayor Gaynor wrote to the president of the commission:

> After careful consideration I have concluded that the probation officers, except the chief probation officers, should not be exempted from competitive examination. These officers should have a vocation for their work, even as a minister of the Gospel has a vocation for his work; but I am satisfied that the Civil Service Commission, by adopting a proper system of examination, can ascertain persons of that kind as well, if not better, than the board of judges could ascertain them if left free to appoint whom they saw fit. I trust you and your associates will establish a system of examination which will enable you to ascertain the vocational fitness of the applicants for the peculiar work which probation officers have to do.

The inferior courts act of 1910 provided for the appointment, on or before September 1, of three chief probation officers and twenty-five other probation officers in the Children's Courts, the Court of Special Sessions, and the City Magistrates' Courts. As announced in THE SURVEY for September 10, the appointments were not made on the date required by law, nor have they yet been made. In July, the Municipal Civil Service Commission announced an examination for these positions to be held on August 11, and about 1,750 candidates filed applications; but the examination was postponed. On October 5 the municipal commission recommended that the positions be exempted from examination. This action could not become effective, however, unless approved by both the mayor and the State Civil Service Commission. Mayor Gaynor held a public hearing on October 19 when arguments for and against exemption were strongly presented, and two days later the mayor directed the Municipal Civil Service Commission to hold a competitive examination for all of the positions except those of chief probation officer.

The question as to whether civil service examinations for probation officers are desirable and practicable has probably never been discussed so thoroughly and so broadly as in New York during the past four months. At the two public hearings held by the Municipal Civil Service Commission, at the hearing held by Mayor Gaynor, and in letters to the municipal commission, the competitive system as a means of assuring the selection of competent officers and of preventing the influence of partisan politics, has been advocated by representatives of many social, civic and religious organizations, including the State Probation Commission, the New York Probation Association, the Brooklyn Juvenile Probation Association, the Catholic Probation League, the Society of St. Vincent de Paul, the Prison Association of New York, the Jewish Shelter and Guardian Society, the City Club, the Catholic Protectory, the Child Helping Department of the Russell Sage Foundation, the Brooklyn Bureau of Charities, the Civil Service Reform Association, the Association of Civil Service Employes, and the Nurses', Union,

University and other settlements. One of the most effective supporters of competition was Mgr. William J. White, Supervisor of Catholic Charities of Brooklyn.

FOR AND AGAINST THE MERIT SYSTEM

A variety of arguments has been presented in favor of allowing justices and magistrates a free hand in making appointments. At first the exponents of exemption seemed to occupy a vantage point, because the law creating the positions declared the probation officers to be confidential officers, and an attempt was made to construe this language as classifying the positions as exempt. The word "confidential" had been inserted in the bill during an executive meeting of a legislative committee late in the session. Governor Hughes in signing the bill disapproved of the use of the word, and indicated his belief that the positions should be filled according to the merit system. He quoted the State Civil Service Commission, with approval, as declaring "that probation officers had been appointed in cities and counties throughout the state as a result of open competitive examinations and with entirely satisfactory results." The representatives of the State Probation Commission and the social workers who advocated selection through a competitive examination, persistently urged that the best test of practicability is experience. They have shown that when examinations for such positions have been conducted in part orally, and have included experience and personal qualifications as subjects, the eligible lists established have made it possible to secure excellent appointments. Throughout the discussions, emphasis has been placed upon the great importance of having only those appointed who are fitted by temperament, character, ability and experience for the highly specialized and responsible duties devolving upon probation officers. Final decision rested upon the question as to whether personal qualifications and vocational fitness of candidates can be determined by a competitive examination.

Mayor Gaynor's action in deciding in favor of an examination is especially worthy of note, since he has been for years an eminent jurist (he was formerly a justice of the State Supreme Court), and since some judges who desired exemption claimed that judges are the only persons qualified to select competent probation officers.

Directly after Mayor Gaynor's decision in favor of a competitive examination the Municipal Civil Service Commission revised the schedule of subjects and relative weights, originally planned for the examination announced for August 11, by increasing the percentages allowed for experience and personal qualifications. The examination will allow thirty per cent for a written paper on the duties of probation officer, thirty per cent for experience, and forty per cent for an oral test. Preceding the formal examination there will be a physical inspection to eliminate candidates whose general appearance clearly indicates that they are unfitted to undertake probation work. The first of the physical tests is announced for October 31.

The municipal commission has been urged to have the assistance of persons familiar with probation and social work, in conducting the examination and in investigating the references and character of the candidates. It is greatly to be hoped that it will avail itself of such assistance. Although about 1,750 persons filed applications to take the examination originally announced on August 11, the number of candidates may be considerably increased, since the commission has reopened the filing of applications which will now be received up to November 7. It is planned to have all candidates take the written test on the same day at the Grand Central Palace. The date, which is not yet set, will fall between November 21 and December 10. Those who pass will be admitted to the oral test, which will partake of the nature of a personal interview, and will necessarily extend over several days or weeks.

Aside from its importance from the point of view of efficient probation work, the examination about to be held is of special interest and significance in that it is understood to be the first oral examination for any position ever conducted by

the New York Municipal Civil Service Commission.

The three chief probation officers, whom Mayor Gaynor believes should be in the exempt class, have been appointed and at work for several weeks, and their classification may properly be different from that of the other probation officers since their duties are largely administrative.

TO HAVE CHARGE OF TRINITY TENEMENTS

There has been much criticism of the Trinity tenements, begun before the tenement house commission of 1894 in New York and renewed with great vigor about two years ago. Since that time, at the request of the recently organized property committee of the vestry, as readers of THE SURVEY may remember,[1] an investigation was made by Emily W. Dinwiddie, secretary of the Tenement House Committee of the Charity Organization Society, of those 334 dwelling houses which were not only on Trinity ground but under the control of the church corporation.

The recent appointment of Miss Dinwiddie as supervisor of these houses promises to be a step toward making Trinity Corporation a model landlord. As we are told also that the better maintenance of the houses now controlled by the church is to be accompanied by the gradual taking up of the leases of the houses now out of its control, it seems that the corporation must before long free itself also of the charge of disclaiming responsibility for the care of the leased houses on half its land.

Trinity has begun to tear down some of its houses, and 180 have now been destroyed, the majority to make way for factories, which, it is expected, will build up the industries of the lower West Side, where most of the Trinity properties lie. At the time of Miss Dinwiddie's investigation, which followed years of agitation, only twelve houses in distinctly bad condition were found and these have since been improved or demolished. Besides putting those houses now under its control in the best possible condition, the work of improvement by the corporation will include taking over and in many cases fundamentally renovating those on leased ground, as their leases expire. With proper maintenance these old fashioned small houses with few tenants, low rents and rooms opening on wide yards, should prove a valuable type of tenement among the tall overcrowded houses of New York.

EMILY WAYLAND DINWIDDIE
Housing expert placed in charge of Trinity's tenements.

For the work she has undertaken Miss Dinwiddie is exceptionally well equipped, as she has a thorough knowledge of both the tenements and the tenement dwellers of New York. In 1901-2 she was in the relief department of the Charity Organization Society. During 1903 she served as inspector in the newly created Tenement House Department and during the same year and 1904 carried on a special investigation for the Octavia Hill Association of Philadelphia. Immediately after she was appointed assistant secretary to the Tenement House Committee of the Charity Organization Society, and

[1] THE SURVEY, February 26, 1910.

in 1905 became secretary from which place she now resigns. Her successor is Madge D. Headley a graduate of De Pauw University and of the New York School of Philanthropy.

CHICAGO FIRMS BUILD WORKMEN'S SANATORIUM

Thirty-two large firms in and about Chicago have opened at Watrous, N. M., the Valmora Industrial Sanitarium for the treatment of their employes who have tuberculosis. This is the first institution of the kind in the United States to be erected by a group of industrial concerns for their own workers. A somewhat similar idea was worked out several years ago by Dr. M. G. Overlock, factory inspector at Worcester, Mass., who induced a number of manufacturers in that state to co-operate in sending their sick workmen to the state sanatorium, and in several Connecticut cities, where workmen and employes have together raised free bed funds.

The Valmora property consists of one thousand acres in San Miguel county with a central administration building and twenty-four cottages. The present capacity is thirty patients, but plans have been made for an early increase to fifty. By the articles of association—the sanatorium is incorporated under the laws of Illinois—either firms or individuals may be members by paying a minimum fee of $500 and twenty cents for each employe over one thousand.

The treatment is to be given at cost price, which is ten dollars a week, and it may be borne by either patient or employer. It is probable that a considerable number of employers will undertake the payment as some of them already have enviable records in this regard.

Question might be raised of the wis dom of building a sanatorium so far from Chicago. Climate plays a constantly diminishing rôle in the plans of tuberculosis workers. It is understood that the property was bought for much less than a similar tract could be had for anywhere in the neighborhood of Chicago. But the saving in purchase price will eventually, if not rapidly, be dissipated by the cost of sending patients to New Mexico. The fare from Chicago to Watrous is $29.60 each way. A round trip railroad fare of almost sixty dollars will quickly run into large sums if the sanatorium is used in rapid rotation for a number of incipient cases. There is the additional disadvantage of a trip of 1,224 miles requiring fifteen hours, and the possibility of adding to New Mexico's already heavy burden of arrested cases who become permanent residents without physical ability or adequate opportunity for self-support.

Membership in the corporation is open to other firms. Those who have joined to date are: Marshall Field and Company, International Harvester Company, Butler Brothers, Siegel-Cooper and Company, Joseph T. Ryerson and Son, The Fair, Hibbard, Spencer, Bartlett and Company, R. T. Crane Company, J. V. Farwell and Company, Automatic Electric Company, The *Daily News*, Mandel Brothers, Western Trust and Savings Bank, F. A. Hardy and Company, First National Bank of Chicago, Continental National Bank, Hibernian National Bank, Ripon Anti-Tuberculosis Society, Illinois Trust and Savings Bank, Richard A. Morley Land and Investment Company, Morris and Company; Sears, Roebuck and Company; Carson, Pirie, Scott and Company; Rothschild and Company; Sprague, Warner and Company, L. Wolff Manufacturing Company, Carleton Dry Goods Company, St. Louis; Chalmers Detroit Automobile Company, Detroit; McDuffee Motor Company, Denver; The National City Bank; Union Trust Company; Selz, Schwab and Company.

The president of the corporation is E. Fletcher Ingals, M. D., of Chicago. The other officers and directors are: John F. Wolff, vice-president; Edwin B. Tuteur, M. D., secretary; Joseph E. Otis, treasurer; E. D. Raynolds, assistant treasurer; J. M. Blazer, counsel; John M. Dodson, M. D.; J. M. Glenn (of Chicago); Charles L. Mix, M. D.; Philip L. James; John T. Pirie, Jr.; Julius Rosenwald; Edward M. Skinner; A. A. Sprague, 2nd; Frederick Tice, M. D. The headquarters of the corporation are at 34 Washington street, Chicago.

JULIA WARD HOWE
FRIEND OF FREEDOM

Julia Ward Howe, "author, philanthropist, mother, friend of the slave, the prisoner, and all who suffer, singer of the battle hymn of freedom," has gone quietly to rest at the great age of ninety-one years. On her ninetieth birthday she was able to say, "The deeper I drink of the cup of life the sweeter it grows." On that day she could look back upon long years of service in behalf of progress for mankind and upon what she valued even more, a happy family life.

Best known as author of The Battle Hymn of the Republic, the Marseillaise of the Civil War, Julia Ward Howe was possessed of rare and varied talents. Daughter of Samuel Ward, first president of the Bank of Commerce and a founder of New York University, she early displayed literary and musical taste and enjoyed the friendship of Charles King, afterward president of Columbia; Washington Irving, John Jacob Astor, and Fitz-Greene Halleck.

While visiting with Longfellow and Charles Sumner at the Perkins Institute for the Blind in order to meet Laura Bridgman, she first saw Dr. Howe, whose work for the blind has been immortalized by Dickens. Her life which after the death of her father had threatened to become one of "beautiful poetic misery," as she termed it, was given a happy reaction and through Dr. Howe she became interested in public work.

Mrs. Howe, the banker's daughter and social belle, was soon converted to abolitionism and she assisted her husband in publishing the anti-slavery paper, the *Commonwealth*. The Battle Hymn of the Republic was written in November, 1861, during the excitement of the war. For some time it received very little mention, but the poem came to be a favorite hymn of those war days.

Dr. and Mrs. Howe went to Europe in 1867 to raise money to purchase supplies for the Grecian patriots. Again in 1872 Mrs. Howe made a trip abroad to interest women in the cause of pease. She sought to call together a great peace congress but was unsuccessful.

After her husband's death in 1876 Mrs. Howe became identified with the movement for the political enfranchisement of women. Her advocacy of the cause was sane and lent dignity and importance to the crusade.

One of the last tributes to this remarkable woman, whose life covered almost exactly the span of her friend, Florence Nightingale, was rendered when an audience of thousands from a score of countries, gathered in the Metropolitan Opera House during the Hudson-Fulton celebration of last year, greeted her with a thunder of applause as she read her poem in honor of Robert Fulton.

CITY AND COUNTRY
MEET IN CLEVELAND

During the week of October 10 Cleveland celebrated the centennial of Cuyahoga county. That the city chose to celebrate the anniversary of the county's founding rather than her own is indicative of an appreciation of opportunities and responsibilities near home. Since the census declared it the sixth city in size, Cleveland has been indulging in a tense vain gloriousness and pomposity, but while realizing its importance as one of the great cities of the nation, it is not forgetting that it is a part of the community that helped make it great. Instead of dominating and overshadowing its environs, as is so often the case with large cities, it asked them to share with it in celebrating the county's anniversary.

That Cleveland was sincere in its desire to exploit the county about the city one does not doubt who reads the program and studies the decorations, for the theme of them all was the history of the founding and growth of the county. That the

city was successful in making this a celebration in which all could take part one could judge by the crowds of country people that thronged the streets and filled the hotels and the homes of old Cleveland residents. Most urbanites are sceptical about city celebrations, declaring that the celebration reached its height in the old time county fair, and that it is impossible for scattered and diversified parts of a city to attempt such an effort. Cleveland proved in this celebration that it had not in its rapid development outgrown the human side, and that it was still possible for all of its people to unite, not only with themselves, but with their country and village friends, and the result was much like the county fair. There was none of the beauty and pomp that distinguished the Hudson-Fulton celebration of last year, but much of the old-time speechmaking in the Chamber of Commerce, that organization of which Cleveland is justly proud, and still more in the public square, which Cleveland has maintained among some other excellent characteristics of the small town. It is significant that in the center of this square stands a large monument erected by Cuyahoga county to the soldiers of the Civil War. That it is one of the most unsightly of monuments does not diminish the sentiment in which it is held.

The parades were rather unpretentious affairs, but remarkable in that they were not used as a means of exploiting the city's commercial life. Everywhere the streets were crowded with people with nothing more serious to do than visit with friends, flaunt gay-colored badges and flags, listen to the band concerts and "do the midway." The only difference between this and the old time village celebration is in the matter of numbers, and the fact that the people now await the flight of the airship instead of the time-honored balloon ascension. It is as though the old spirit of conservatism and simplicity that the forefathers brought with them from Connecticut were for a time holding in leash the tense, progressive spirit of the West, and in the interim the country is coming to the city, not on a shopping expedition, but in the same spirit of enjoyment that the city goes to the country on a hot afternoon in August. This is one way by which the city may help relieve the monotony of rural life.

ST. LOUIS SCHOOL OF SOCIAL ECONOMY

In its present location, down town, in the old Museum of Fine Arts at Nineteenth and Locust streets, the St. Louis School of Social Economy has commodious quarters within easy reach of the chief social agencies of the city.

One of the new features this year is an exchange by which the school gives a course in social service to officers, leaders and committee members of the Young Women's Christian Association and the association gives the school a normal course in athletics, games and folk dances. Another new feature is a Friday morning class for women with a measure of leisure who are interested in social work. Under the title Preventive Philanthropy and Constructive Social Work, this course deals with such questions as causes and elimination of poverty; equalization of employment and avoidance of rush seasons and irregularity of work; prevention of industrial accidents and sickness, systems of industrial insurance; fortification against intemperance, immorality, shiftlessness; good housing, city planning; the relation of the public school to other institutions, its function in social progress, and the reasons why three-fourths of the children who enter do not complete the grades; industrial and trade instruction, physical examination, medical inspection, school nursing, and increased use of public school property.

In January, the school will offer a night course for social workers unable to attend the day classes.

The department of research is organized with a force of thirteen students, four of whom are second year appointments. The research will be chiefly a continuation of the survey of child life begun last year. During the summer the investigations of standard of living, and of county outdoor relief in Missouri, and the report on the untrained child in industry were completed.

The faculty of the school has been strengthened by the addition of Lucy H. Oppen, a graduate of Smith College, an experienced teacher and for two years connected with the New York Charity Organization Society as assistant district secretary and chief of the investigation bureau. Miss Oppen will supervise the apprentice work of the students, and assist in the teaching. She is in every way well equipped for her new work.

CURFEW LAW IN SPOKANE

Rather more than a year ago the peculiarly shocking case of a little girl ruined through lack of oversight at home that left her free to spend her nights on the street, brought to the attention of the citizens of Spokane the fact that the city streets at night are schools of crime and immorality for children. H. H. Moore, secretary of the boys' division of the Y. M. C. A., found on the statute books an old curfew ordinance long disregarded, providing that children found on the streets after a certain hour should be arrested. He determined to start a movement for its revival in a modernized form and city officials, judges and public-spirited citizens were enlisted both by personal appeals and through the press, which also sought to arouse parental responsibility.

Toward the end of July, 1909, an improved ordinance went into effect, imposing a fine of ten dollars on parents or guardians of children under sixteen found on the streets after 8.30 P. M. in summer or 8 P. M. in winter and all young persons between sixteen and eighteen found after 9.30 in summer or 8.30 in winter.

The daily force of seventy-four policemen in a population of 125,000 is obviously inadequate to enforce such a law and the withdrawal of the police from the parks at ten o'clock at night is an element of weakness in carrying out the ordinance. Nevertheless, the two probation officers who have general charge of the parks and the police report a decrease in child loiterers at night.

The promoters believe that the law has proved its usefulness and that the inadequacy of the police force has been in part made up by a new sense of responsibility in parents, for which the press and those volunteers who have made it their business to conduct children home with a warning are responsible.

As for the effect on morality, neither Juvenile Court nor other statistics are available to show what this Spartan method of teaching the young the path they must tread has accomplished. Until some such measurable results can be shown there will be ground for the claim of critics of the curfew law in other cities, that the furnishings by the community of legitimate amusements and normal social life are a better incentive to morality than repressive measures.

THE RHODE ISLAND STATE CONFERENCE

The second Rhode Island State Conference of Charities and Correction was held October 18-19 at the rooms of the Pawtucket Business Men's Association. Governor Pothier, president of the conference, spoke of the problems confronting the citizens of the state, particularly those of the charitable organizations which affect social welfare, state progress, and the character and health of future generations. The "boy scout" movement, he thought, if properly conducted should become one of the most powerful instruments for good which has appeared for many years.

Hastings H. Hart's paper on Modern Methods of Dealing with Children showed that the child problem is one to be studied intellectually and scientifically; that private home-care for children is an improvement on institutional care.

Jessie M. Hixon was chairman of the session on Families and Neighborhoods. Mrs. John M. Glenn of New York made an address treating of desertion, the home maker as a factory worker, the widowed mother and premature employment. She brought out the necessity of keeping the family together, all laws recognizing that family life must be guarded if we are to have desirable citizens; that the individual is helpless to better conditions, as is the individual society, if we do not have proper laws to make deserting husbands

take care of their families and prevent their children from becoming public charges. The discussion was led by James Minnick of the Providence Society for Organizing Charity; Hastings H. Hart and William H. McKitchen.

The need of teaching social hygiene of sex was discussed under the chairmanship of Rev. Edward Talmadge Root. The speakers were E. L. Keyes, Jr., M. D., of the American Society of Sanitary and Moral Prophylaxis; Gardner T. Swarts, M. D., secretary of the State Board of Health; Prof. John L. Alger of the State Normal School; Caesar Misch and Harriet J. Thomas. They showed that instruction should begin in the kindergarten. In the State Normal School lectures are given, which pupils attend with their parents' consent. In this work the teacher should be the inspiration and the model. The inspiration of the teacher is worth more than instruction. The governor is to appoint a committee to carry out the suggestions of the conference.

The Improved Care of the Insane in Rhode Island was the subject of Wednesday evening's session, of which Arthur H. Harrington, M. D., was chairman. Charles P. Bancroft, M. D., of Concord, N. H.; Henry C. Hall, M. D., of Providence, and William Mabon, M. D., of New York made addresses, urging not alone moral support, but vital action in creating public sentiment concerning the commitment of the insane.

The next conference will be in Newport next October. Gov. A. J. Pothier was re-elected president. Harriet E. Thomas of Newport is secretary; Anna F. Hunter of Newport, corresponding secretary, and Matthew J. Cummings of Providence, treasurer.

MUNICIPAL RESEARCH PLAN FOR FEDERAL GOVERNMENT

From a modest beginning a little over four years ago in New York, the Bureau of Municipal Research has grown in size and influence; similar agencies of citizen inquiry have been established in a half dozen other cities and now the idea has spread to the investigation of the departments of the national government.

President Taft, who for many months has been searching for ways to effect economies in the national government and to introduce more systematic and simpler business methods in the departments at Washington has established a bureau of research under Frederick A. Cleveland, a director of the Bureau of Municipal Research in New York and organizer of the one in Philadelphia. Dr. Cleveland is well qualified by experience for the appointment. After service as an instructor at the University of Pennsylvania, he became an accountant and was in charge of the work done by Haskins and Sells on the books of one of the three big life insurance companies in New York at the time of their reorganization. He has also served as a member of ex-Mayor McClellan's advisory commission on finance and taxation and on the committees appointed by Comptrollers Metz and Prendergast for the reorganization of accounts, methods, office organization and work. He is well known as a writer on financial subjects. Four or five other men are to be associated with him in the direction of the work, who will have an adequate force of investigators and clerical assistants. The expenses are to be met from an appropriation of $100,000 granted at the last session of congress. The bureau will make its reports directly to the president. Secretary Norton, who interested the president in the plan, will have an active part in carrying it out.

Besides this central agency of outside investigators, each government department is to have a committee of three. The men selected for this service will suggest new and simpler methods to their respective executive heads who will adopt those that seem practicable.

The special committee will begin work in the Treasury Department and try to devise a better method for making appropriations for the government service. The whole emphasis is to be directed to methods rather than to men or women.

The state is the most important branch of governmental service to which outside expert investigation has not been applied. It is quite likely that in the near future we may expect an announcement telling of work undertaken in this field.

ROCHESTER'S SOCIAL PLANS

The preparatory work done by a special committee of the Rochester Chamber of Commerce preliminary to the formation of a Federated Charities will soon bear fruit. A. E. Drescher, manufacturer and banker; Henry T. Noyes, Jr., manufacturer; Roland B. Woodward, secretary of the Chamber of Commerce; and A. J. Katz, retired capitalist, president of the United Jewish Charities and head of the Jewish Orphan Asylum; who are members of this committee, have just concluded a tour of inspection through Baltimore, Philadelphia, and New York. Later they may visit other cities. Their purpose was to look into the methods of organized charity work, and to consult leaders in social work as to the general trend of the movement in Rochester.

The Rochester Federated Charities will mean a real federation of the different social organizations, without their amalgamation into one corporation. It is expected that the Federated Charities will also perform the functions usual to an associated charities, as well as serve as a center for unified action in connection with social reform.

The society, after working out a satisfactory arrangement with the old body known as the Society for Organizing Charity, will include registration, investigation and co-operative treatment of individual families, even though it will become the mouthpiece of the associated interests of the city in furthering social and civic progress.

The action of this busy group of men in spending time in examining the work in other cities rather than delegating it to some one representative, is a most encouraging sign of the times. It comes very shortly after the visit of the special committee of the Chicago Association of Commerce to the St. Louis National Conference of Charities in order to obtain light on the best methods in charities endorsement and the broad scope of that field. It should be added that the Rochester Chamber of Commerce was represented at the St. Louis conference by Henry T. Noyes, Jr.

It is expected that the Chamber of Commerce will be relieved of its responsibility within the next month or two and that the society by that time will be in actual operation. Its progress will be watched with considerable interest.

HUGHES

An Appreciation

HOMER FOLKS

Place, Executive Chamber, Albany, N. Y.
Time, Thursday, October 6, 1910.
Exit Charles E. Hughes, governor of the state of New York.

Place, Supreme Court Room, Washington, D. C.
Time, Monday, October 10, 1910.
Enter Charles E. Hughes, associate justice of the Supreme Court of the United States.

Inclination and obligation alike prompt to an effort to express the significance to social work of the events above chronicled. Inclination because of the enduring satisfaction of having been to a very modest extent a co-worker during the past four years; obligation, because Governor Hughes's activities during these four years have placed all social workers under a lasting debt to him. As its motive cannot be misunderstood, let it be frank.

The governor of the Empire state is one of the most important factors in social work in the state. From the moment of his election he is concerned almost continually with social problems. He has hundreds of appointments to make on the boards of managers of the state charitable and correctional institutions, and on the central boards having supervision or control over them. A large part of the financial problems of the state turn on the development of its humanitarian work. An increasing portion of its legislation deals with social questions. An increasing number of state departments concern themselves directly, and in important ways, with social well-being. Add to this the fact that when the governor of the Empire state speaks, the people of the nation hear; that if he shows a deep interest in social questions, the people become interested. If he expresses optimistic views and participates in ameliorative measures, the people tend to become

optimistic and to participate in social work. In the performance of all these varied tasks no governor of New York has met more completely the possibilities of the office.

Looking back over four years of observation of Governor Hughes's work in these lines, our final impressions of this master social worker are something like these:

1. An unrivalled mental equipment; a piece of thinking machinery working with almost terrifying velocity; a power to analyze and weigh in the balance, which must ever be the envy of any observer.
2. An unexampled industry; hours of work which put to shame any ordinary worker; a cheerful expectation of spending and being spent in the people's service.
3. An absence of prejudice and a habit of taking into consideration all the factors in the situation; not simply a willingness to consider facts thrust upon him, but a constant insistence on having all the facts brought before him.

In first meeting such a personality, one feels a certain sense of insecurity. After working for years under conditions which involved not only getting the facts together, but also assembling various lines of influence, it is a bit disconcerting to find oneself depending solely on the naked merits of the case. On second thought and further experience, however, it is intensely stimulating to feel that the considerations, data, and arguments which you may bring forward, will actually be taken under advisement and will exert their due, proper and rightful weight in the final decision. I regard as one of the greatest services which Governor Hughes has rendered, the fact that his methods have stimulated hundreds of young men, and older men, too, for that matter, to participate in public affairs, by reason of the conviction created within them that it would be worth while; that when the facts had all been gathered and the arguments carefully presented, they would not be thrust into the waste basket, while some unnamed person representing large influence, or large means, or many votes, whispered in secret the word that determined the fate of the measure under consideration.

Governor Hughes's interest in social work grew visibly and continuously during his four-year term. He became one of the foremost advocates and most effective participants in the campaign for the prevention of tuberculosis. One of his very latest public addresses as also one of his best, was addressed to a delegation representing various tuberculosis committees, which called on him only two days before his resignation. A considerable part of his address, which may almost be looked upon, in a sense, as his farewell address, is published elsewhere in this number of THE SURVEY. Governor Hughes became greatly interested also in other lines of preventive work. He foresaw a fruitful movement for the reduction of insanity. He was keenly interested in the work of the Employers' Liability Commission. One of his last official acts was the appointment of a Commission on Congestion of Population. His inspection of the state institutions was not perfunctory. He could spend only some two-thirds of a day at the State Agricultural and Industrial School. "The governor could not have seen much of your institution," I said to the superintendent, later. "Yes, he saw it all," he replied. "When he came he made but one request—that the lunch period be limited to fifteen minutes." His address at the State Fair in September was a fine survey of the state administrative department and its institutions. The selection of site commissions for the New York State Training School for Boys, and the New York State Custodial Asylum, now the Letchworth Village, occurred early in his first year. Each of these institutions bids fair to set new standards in adaptation to purpose. Each has had at all times his keen interest and strong support, even when the condition of the treasury constrained him to withhold desired appropriations for more rapid development. Early in his first year he was called upon to decide whether he would continue an important reform begun under the auspices of his predecessor. In the face of considerable opposition he signed the bill establishing the State Probation Commission, and each subsequent year approved important measures refining and strengthening this growing and hopeful department of our correctional

system. If he did not always find the fittest man for an office, he at least looked for him, and stood ready to appoint him. No executive ever assumed more complete responsibility for his appointments. Has not the method been justified by its results?

Lest it be thought that admiration is based, not on things accomplished but on some sort of hero-worship, perhaps it had best be recorded that probably every social worker in the state felt at times disappointed in some act of the executive. His judgment of men did not always coincide with the general consensus of opinion, though probably it did so more frequently than in the case of any other incumbent of the office. One sometimes felt that he had too little regard for expert opinion, insisting too strongly on forming his own independent judgment of matters as to which his experience must of necessity be very limited; and, finally, one sometimes felt an assumption of an all-round fitness for public service on the part of lawyers as compared with any other class of citizens.

Stimson we do not know, and Dix we do not know; but if we knew both intimately, we would vote for the one who seemed to us most like Hughes.

Is it permissible to look forward as well as backward? May we try to guess from the past something as to methods and principles of the future? If so, it would be to express the belief that, in the upturned faces of hundreds, if not thousands, of audiences in all parts of the state, at the small stations of upstate railways, in the larger cities, and in the densely populated portions of the metropolis, Governor Hughes has read that which he could never have perused in the quiet of the library; that, in his judicial career, he will be sensitive, as he could not have been without these executive experiences, to the fact that law is not an exact science; that its human side should always be taken into account; that it is not comprehended solely in the records of legislative bodies and the decrees of courts, but is written still more largely in the development of the social, economic and political structure of the community.

The tide of democracy rises. The Supreme Court of the United States will be either the dam over which it will one day break in uncontrolled disaster, or it will be the mechanism by which its progress is made uniform and beneficent. I venture the assertion that no other appointment which could have been made would have brought genuine satisfaction to so large a number of American citizens.

THE CHICAGO PLAN

Two striking facts are emphasized in Mr. Wing's article on another page of this issue: first, that it is perfectly possible, and perhaps feasible, to support a municipal campaign against tuberculosis by a direct tax levy; and second, that private experimental initiative will surely result in official action, if carried on scientifically and persistently.

When the city of Chicago, acting largely under the leadership of the Chicago Tuberculosis Institute, voted at a special election to submit itself to a direct tax for a municipal tuberculosis hospital, a step both unique and significant for the city's welfare was taken. And when the board of directors of the new hospital, even before money was available for its use, with keen foresight interpreted its office as one of greater scope than mere institution builders and managers, and took upon itself the task of establishing a complete system of dispensary and hospital care for its city, another forward stride of the greatest importance to the city was taken. With from a half million to a million dollars yearly at its command, this sanatorium board, standing on the broad policy which it has outlined, should soon demonstrate that the prevention of tuberculosis and the reduction of mortality from it to a practical minimum, are by no means impossible even in a large city.

The selection of Frank E. Wing, under whose leadership as the chief executive of the Chicago Tuberculosis Institute the municipal sanatorium became a reality, marks a further advance step in Chicago's campaign. Mr. Wing forms the connecting link between the private society and the municipal body, and assures the continuance of the harmonious

FRANK E. WING,

General superintendent Municipal Tuberculosis Sanitarium of Chicago.

Mr Wing, who is a native of Maine, was graduated from Wesleyan University, Middletown, Conn., in 1900. He was an instructor in science and athletics in the high schools at Stamford, Conn., and Milton, Mass., and later head of the Science department of the Allegheny Preparatory School at Pittsburgh. He entered social work in 1903 with the New York Association for Improving the Condition of the Poor of which he was later assistant general agent. He was associate director of the Pittsburgh Survey in 1908. In the fall of that year he became superintendent of the Chicago Tuberculosis Institute, from which position he retires to enter municipal work. He is secretary of the Illinois State Association for the Prevention of Tuberculosis and of the Illinois State Conference of Charities and Correction. In training, experience and personality he is peculiarly well equipped for the public service on which he is entering.

relations that have been so fruitful in years past.

The Chicago Tuberculosis Institute is not going out of business. For it is left the limitless field of education, experimentation and stimulation of public activity. Its work in these directions will complement that of the municipal workers. Since this body was organized in 1906 it has spent less than $70,000, but it has been the chief factor in securing an expenditure of more than one million dollars for tuberculosis by the city of Chicago and Cook county. There are many parallel cases in public school work. Private initiative and funds demonstrated the value of recreation centers, public baths, playgrounds, and a score of other activities, before the public authorities carried them out in a big way. The State Charities Aid Association furnishes another instance in tuberculosis work in New York state. In three years it has spent about $55,000, and as a direct result of its demonstrations has inspired official appropriations aggregating more than $1,500,000. Private philanthropic organizations of all kinds may well profit by the experience of the Chicago Tuberculosis Institute.

The two most efficient methods of securing money to build and maintain a local tuberculosis hospital afford some interesting comparisons in the light of Chicago's experience. Chicago is the only large city in the United States which has voted a special direct tax for establishing a sanatorium for consumptives, although Rock Island, Ill., has taken similar action, and at a recent election Cleveland voted to issue bonds for a $250,000 hospital. In New York and several other states, the Legislatures have enacted laws giving county officials permission to erect and maintain county tuberculosis hospitals without submitting the question to a popular vote. If the number of institutions being established by county boards is any indication, this latter course of procedure seems to be the most productive of results. On the other hand, it is doubtful if, in a large city, such a sum of money as is available in Chicago would have been appropriated without a direct authorization of the people. It is doubtful, too, whether it takes more work and money on the part of private societies to induce a county board to make an appropriation or to persuade an entire electorate to vote "yes" on a sanatorium question. The ideal situation seems to be a combination of both plans, so that a county may act without a referendum vote and a large city may vote to submit itself to a direct tax as in the case of Chicago.

October 29, 1910.

CONVALESCENT PATIENTS AT EDWARD SANATORIUM.

FIRST COMPLETE CITY PLAN FOR CARE OF TUBERCULOSIS

FRANK E. WING

GENERAL SUPERINTENDENT, MUNICIPAL TUBERCULOSIS SANITARIUM OF CHICAGO

In characteristic way, Chicago is busying herself with the details of a comprehensive plan for the ultimate control of tuberculosis. She has laid the foundation along broad lines, and is now grappling with a structural work in some respects unique and destined eventually to find its completion in co-ordinated machinery well equipped for a complete solution of all phases of the tuberculosis problem.

With the county caring for advanced cases, with municipal care and control of other phases of the disease assured, and with several well managed private sanatoriums for the benefit of the financially able, a good beginning has been made toward the realization of the motto: "No tuberculosis patient uncared for; no tubercular infection uncontrolled."

MUNICIPAL SANITARIUM

In March, 1909, Governor Deneen signed an amendment to the Glackin tuberculosis sanitarium[1] law, passed at the preceding session of the Legislature, permitting cities and villages in Illinois, after a referendum to the people, to levy a tax annually not to exceed one mill on the dollar of city valuation, for the purpose of establishing a municipal sanitarium for the free care and treatment of persons suffering from tuberculosis. This question was submitted to the people of Chicago after a vigorous campaign by the Tuberculosis Institute, the Department of Health and the daily newspapers, at the general election of April 6, 1909, and was carried by an overwhelming vote of four to one. On April 12, 1909, Mayor Busse appointed Harlow N. Higinbotham, a prominent citizen well known as president of the World's Fair of 1893; Dr. William A. Evans, Chicago's efficient health commissioner; and Dr. Theodore B. Sachs,

[1] The word is spelled "sanitarium" instead of "sanatorium", wherever the city institution is referred to, as the former is the spelling used in the law creating the institution.

who for fifteen years has done the heavy thinking, backed up by untiring personal service, for the cause of the consumptive in Chicago, as directors of the newly created sanitarium. No appointments could have been more fittingly made.

On January 24, 1910, at the recommendation of these directors, the City Council passed the tax-levying ordinance placing the first tax at one-half a mill. This tax will return to the "tuberculosis sanitarium fund" $431,000 for use during the year 1911. It will become available as soon after January 1 as the 1910 taxes begin to come in.

While their accountability to the people would not legally begin until after the first installment of money was actually in the treasury next January, the directors accepted as their moral obligation the relief of the situation at the first possible date, and during the past summer took steps toward an earlier application of the funds destined to come under their control. Consequently, on September 5, an application was filed with the comptroller requesting him to negotiate a loan by the sale of tax warrants sufficient in amount to finance the work of the sanitarium board for the next six months. These negotiations proving successful, the board of directors met September 10 and adopted a plan putting into operation as of September 1 a system designed eventually to control the entire tuberculosis situation in Chicago. The preliminary steps of this plan are as follows:

(1) In order to get into closer contact with the large army of tuberculosis sufferers in Chicago, the Municipal Sanitarium will establish a dispensary department and take over the existing tuberculosis dispensaries, maintained as a part of the work of the Chicago Tuberculosis Institute. These will serve as a nucleus of a city-wide system of tuberculosis clinics, furnishing the most complete means possible of detecting for institutional treatment, tuberculosis in curable stages, as well as of putting into operation sanatorium methods of treating consumptives in their homes. The entire nursing force of the existing Tuberculosis Institute dispensaries, as well as their mechanical facilities, will gradually be increased so as eventually to bring under medical and nursing control every case of tuberculosis in Chicago.

(2) To proceed as rapidly as possible toward the purchase of a site, and then go ahead with the construction of the proposed sanitarium, which under the law must be located within the corporate limits of the city. When completed, the sanitarium will have ample facilities for the treatment of patients in the curable stages of the disease.

(3) To secure the services at once of a general superintendent to act as executive officer of the board of directors in all of its departments.

COMPLETE SYSTEM PLANNED

Such, in brief, is the plan of the Municipal Sanitarium as it will first be put into operation. But the directors will not stop here. They hold a much broader conception of the scope of the "sanitarium fund." They feel that the people of Chicago, in authorizing a tax which if assessed to the maximum will yield nearly a million dollars a year for tuberculosis, will look to them to perfect a system designed really to take care of tuber-

CHICAGO FRESH AIR HOSPITAL.
Showing the main building and the men's "shack."

COOK COUNTY CONSUMPTIVES HOSPITAL.
Opened only a year ago, it has already had to increase the number of beds for advanced cases

culosis in Chicago. Consequently they hope eventually to widen the scope of their activities until they include institutional treatment of that large class of doubful middle stage cases at present neglected by most cities, day camps and night camps if desirable, summer camps for tubercularly inclined children, special sanatorium facilities for tuberculous children in all stages of the disease, after-care institutions for discharged sanatorium patients, and possibly special relief so far as it is a part of the treatment of consumptives in their homes. With the gradual development of ample institutional provisions for the hopeful cases, an arrangement may possibly be entered into with the county authorities for the transfer of their hospitals for advanced cases to the Municipal Sanitarium, thus insuring a unified institutional control of all cases in the city. These are some of the possibilities that thus early shape themselves in the minds of the board.

For the present, matters of more immediate importance, such as the readjustment and extension of the dispensary work, purchase of a site, and construction of a sanitarium will be carried forward to an early consummation. Already events have shown that the experience of other localities in securing a site may be repeated here. Thus far the road has not been strewn with roses. After a search of several months, eighty-five acres of land near the north city limits have been found. The tract is admirably adapted for the purpose, the southern third being a gravelly ridge well suited for buildings, the middle third of rich dark soil suited for garden land, and the north third a beautiful forest of large elms and maples offering a splendid opportunity for park and recreational features, as well as affording an admirable break against the harsh winter gales from the North. If nature had made a special effort to provide an ideal spot without changing the entire face of Chicago's topography, she could not have done better. The drainage is good. The place can be reached by a five-cent car fare. It is away from city smoke and dust, and the surrounding property is not yet built up.

At the same time, certain large holders of adjacent property have conceived a violent objection to the settling of this neighbor, and are using all their influence to persuade the finance committee of the City Council that its purchase would be a "neighborhood calamity," on the ground that it will cause property values in the vicinity to deteriorate—an argument common through all the history of sanatorium location. The sanitarium directors and other defenders of the purchase affirm that the same objection would be encountered elsewhere, and that to yield to this demand would prac-

EDWARD SANATORIUM.
The new medical building.

tically restrain the directors from locating at all. They maintain that in the long run the damage is fancied rather than real, and that if surrounding property does permanently depreciate it will be due to the antagonism of these same owners, and its resulting publicity. A detailed answer to all possible arguments against the location of the sanitarium on the selected site is being prepared. This will be submitted by the sanitarium board to the finance committee of the City Council.

Fortunately the finance committee is not disposed to give much weight to the objections, and unless some unforeseen obstacle is placed in the way, it is practically assured that the committee will give its unanimous assent to the purchase when the matter comes up for final action about November 1. In fairness to all, a delay of one month has been granted to give the opponents an opportunity to find an equally desirable site elsewhere, which will not meet with the same objections from the owners of surrounding land. Inasmuch as their search promises little, it seems probable that nothing will restrain the sanitarium board from acquiring this land and building on it. While the number of patients to be accommodated has not yet been determined, 250 seems to be the prevailing estimate.

WELL-EQUIPPED DISPENSARIES

The dispensary system, as taken over and as now operated, consists of eight free tuberculosis dispensaries, a staff of twelve visiting tuberculosis nurses including a superintendent of nurses, and twenty-five attending physicians who have given their services and their experience, many of them for the entire three years since the dispensary work of the Tuberculosis Institute was organized. These physicians have been asked to continue in the dispensary work without pay until a sound and satisfactory basis of compensation can be agreed upon. The work is already well co-ordinated, with a central office for the superintendent of nurses, a well worked out follow-up system in the handling of cases, and a central filing system of duplicate records serving as a clearing house for all dispensary cases. Thus far the dispensary department has confined itself strictly to the medical and nursing side of the problem, referring all cases for general or special relief to the United Charities, the Jewish Aid Society, the county, or other relief agency. It has also handled only the ambulatory cases, working under an agreement with the Visiting Nurse Association to transfer all bed cases to that organization. With the larger financial means at its disposal, it is probable that the nursing care of all cases will event-

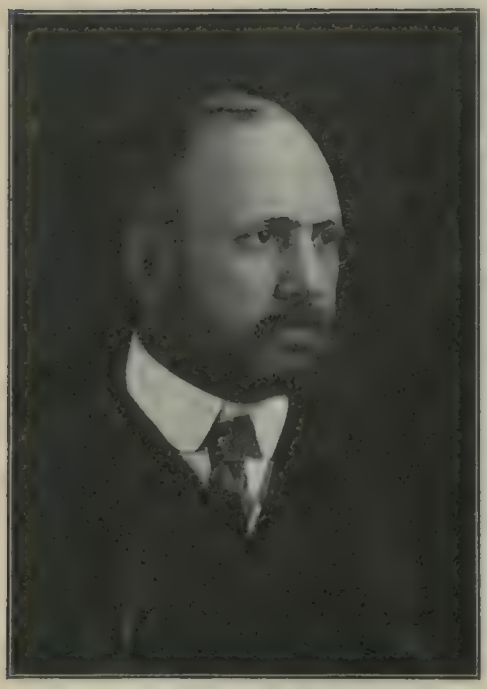
ually be undertaken, and that some method of special relief where the line can be definitely drawn as a necessary part of the treatment of the patient, will be inaugurated, thus relieving the charity organizations of much of their present burden, which in the case of the United Charities has amounted to fully $20,000 during the past year.

Something of the volume of work done by the existing dispensary department may be seen from the following brief analysis of work for the past year: (September 1, 1909 to August 31, 1910).

Total number of new patients examined	4,062
Total visits by patients to dispensaries	20,130
Total visits by nurses into the homes	18,580

COOK COUNTY HOSPITAL

In the meantime, to turn to other public hospital facilities, Cook county has considerably increased its provision for advanced cases. A year ago the new Cook County Consumptives' Hospital was opened on the county hospital grounds, with accommodations for 325 patients. This was quickly filled by the transfer of 200 of the 350 patients in the consumptives' department of the Dunning Institution, and by the admission of other new patients from the city. It has been operating at its full capacity ever since.



The building is in the form of the letter E, with the front or main portion corresponding to the main part of the letter, five stories high and the wings four stories. It is equipped with open-air reclining gardens and enclosed sun parlors on the roof, devoted entirely to purposes of rest and recreation, with "quiet rooms" for terminal cases on each floor, with examining room, kitchen and disinfecting room in the basement, chapel on the first floor, and a dining room on each floor large enough to provide for fifty per cent of the patients. Patients who are too ill to go to the dining room are served in the wards. The wards are light and airy, with large windows and transoms over them. There are a laboratory, nurses' and doctors' rooms and every other modern improvement. Each ward of twenty-four beds has two subdivisions of twelve beds each separated by a bathroom with movable tub, toilet room and linen closet. Paper napkins and large paper bag receptacles are used instead of the traditional sputum box, and the common drinking cup has been superseded by a drinking glass for each patient. Food is sufficient in quantity, two quarts of milk a day, with plenty of bread, butter, eggs, meat and potatoes being allowed each patient. The building is of paving brick with mosaic and plasticine floors and terra-cotta trimmings. The contract price was $224,300.

COOK COUNTY INFIRMARY

With the opening of the new Cook County Infirmary at Oak Forest, further

THE CHICAGO-WINFIELD SANATORIUM.

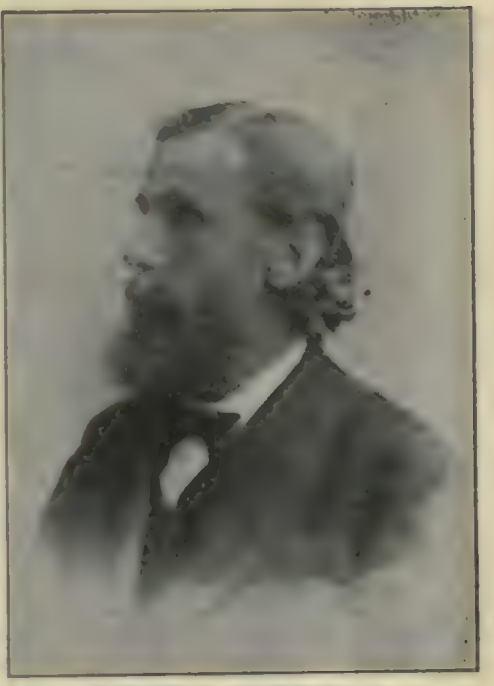
WILLIAM A. EVANS, M. D.,
Commissioner of health; one of the directors of the Municipal Tuberculosis Sanitarium.

facilities for the special care of the consumptive population of this branch of the county poor service will be provided in the form of a separate tuberculosis hospital. It will be a two-story building accommodating 175 patients; provided with sun parlors and roof garden, and two open air sleeping shacks, each for ten patients in early stages of the disease. This division is based on the proportion of early to advanced cases now in the Dunning Institution, all of whom will be transferred to Oak Forest on the opening of the new buildings early next summer.

THE EDWARD SANATORIUM

The private institutions are numerous and cover a wide range in the kinds of patients admitted. During the past year and a half there has been a marked increase in the bed capacity of the Edward Sanatorium, a department of the Chicago Tuberculosis Institute located at Naperville, about thirty miles west of Chicago, of which Dr. Theodore B. Sachs is the medical director. This institution accommodates sixty curable patients and its facilities are to be extended in the near future. The capacity was recently enlarged through the gift of a new medical building by Mrs. Keith Spalding, the original donor of the sanatorium; by the gift of a model six-patient cottage shack by the Sears-Roebuck Company, and by the construction of two day shacks. The farm equipment has been increased by the addition of a poultry house and other improvements. The medical building, which cost $24,000, is fully equipped with all modern facilities for a strictly medical institution, including examining room, drug room, laboratory, nose and throat room and isolation rooms. It also contains an infirmary with connecting porches for twelve bed patients.

Last June a resident physician, who is also a trained laboratory worker, was added to the staff, which includes a superintendent and two other resident nurses, and two visiting laryngologists besides a medical director. The Edward Sanatorium is first and last for the treatment of the wage-earning class who can not only be apparently cured, but whose working capacity can be restored. It is intended as a model for other institutions in this climate, and the success with which it has demonstrated the efficacy of treatment in the home climate, affords ample assurance to the Board of Directors of the Municipal Sanitarium that it is fully justified in looking for gratifying results for the large public enterprise which has been entrusted to it. The medical statistics of this institution were freely quoted in the recent campaign to secure the Municipal Sanitarium.



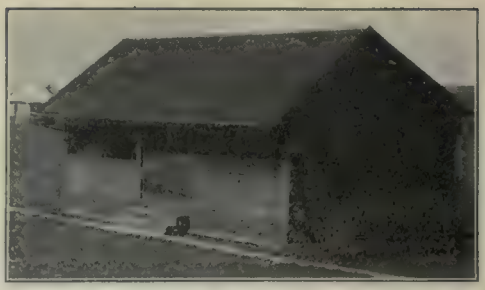
THE WINFIELD SANATORIUM

The success of the Edward Sanatorium prompted the establishment of the Chicago-Winfield Sanatorium at Winfield, about eight miles from Naperville, which opened its doors to the public in the spring of 1909. This institution, as started by the Baron Hirsch Woman's Club, the Jewish Consumptives' Relief Society, and the Willing Workers on a farm bought and donated for the purpose by Charles A. Stonehill, con-

sisted of an administration building and three shacks, one of them for children. Recently a new shack was added to the equipment, the gift of Mrs. Emanuel Mandel. The sanatorium is now under the management of the Associated Jewish Charities of Chicago. Its capacity is sixty-five patients with an average attendance of about fifty-eight. No report has thus far been published, but the results are as favorable as in other sanatoriums in home climates.

CHICAGO FRESH AIR HOSPITAL

While the above institutions admit only patients in curable stages, Chicago has for a long time felt the need of a place where pay patients may be treated irrespective of the stage of the disease, especially during the past five or six years since St. Ann's and other hospitals have closed their doors absolutely to all but surgical cases of tuberculosis. Consequently the opening of the Chicago Fresh Air Hospital last July on the extreme north end of the city, for patients in any stage was hailed with a large measure of relief. This institution consists of an administration building with office, dining room, nurses' quarters, a large ward and screened porches for advanced cases, and two large open-air shacks of modern type each accommodating nine patients. It filled rapidly after its opening and is running at nearly its full capacity of thirty patents. The policy as announced by its medical director, Dr. Ethan A. Gray, is to make this institution a strong educational factor in the control of the disease. Patients who cannot afford a prolonged residence in the hospital are encouraged to enter for a term of one to three months, after which they may go back to their homes and continue under careful medical direction the mode of life learned at "Fresh Air." While this may not be ideal and is discouraged for those who can afford a longer treatment in the hospital, the management feels that it is doing a lasting service to the community by affording an opportunity to get a start to many who otherwise would never have one.



HARLOW N. HIGINBOTHAM.
Well known as president of the World's Fair of 1903; president of the Municipal Tuberculosis Sanitarium.

THEODORE B. SACHS, M. D.
Head of the sanatorium department of the Chicago Tuberculosis Institute. Secretary of the Municipal Tuberculosis Sanitorium.

THE HOME FOR INCURABLES

The Chicago Home for Incurables has for many years claimed the distinction of being the only place in Chicago outside the County Hospital where consumptives in the hopeless stage of the disease could be cared for. It has a consumptives' department accommodating sixty patients, and is just what its name implies, a "home" for those who by reason of their affliction are unable longer to cope with life's burdens. So far as its capacity will allow, consumptives are received here without any consideration as to their ability to pay, the preference, if any, being given to those who cannot pay. Its beautiful buildings and grounds and its heavy endowment are an everlasting tribute to the generosity of their donors, and to Harlow N. Higinbotham who for the past thirty years has personally investigated and admitted every patient who has entered the institution. Two years ago a tablet was erected at the entrance, which more fitly than I can describe depicts the spirit which pervades its walls. It reads:

PATIENTS' SLEEPING SHACK
at the Edward Sanatorium.

> This tablet is placed in loving memory of those good and faithful women and men who gave unselfishly of themselves and generously of their means, for the establishment of this Home. Their names are not recorded here—beyond in the infinite, they are written on pages more glorious and far more enduring.
>
> This tablet is the gift and tribute of one who knew them well and loved them fondly.
>
> May patience, and peace and plenty, ever abide within its walls. May those who suffer and those who serve, those who sing, and those who pray, as well as those who, unable to do more than stand by and cheer, be equally blessed.
>
> May this great city, and all the agencies here employed to heal the sick, alleviate suffering, and advance the interest of the community, be prosperous always.

A STATISTICAL SUMMARY OF INSTITUTIONAL FACILITIES FOR THE CARE OF CONSUMPTIVES IN CHICAGO, CLASSIFIED ACCORDING TO STAGE.

Institution	Stage	Beds	Total	No. of patients cared for in past year
Cook County Consumptives' Hospital	Advanced	325		2,091
Dunning—Consumptives' Department	Mod. Advanced	150		1,382

Beds discontinued at Dunning, on Transfer to Oak Forest			150	
Total existing and proposed			985	

A NEW AID TO JUSTICE[1]

THE COMMITTEE ON CRIMINAL COURTS

LAWRENCE VEILLER

ALFRED R. PAGE.

A distinguished group of New Yorkers interested in social problems has recently come together with the definite purpose of aiding the administration of justice in the lower criminal courts—those branches of government which stand to the large mass of our immigrant population, not merely as the outward manifestation of justice in America, but in very truth as American institutions themselves.

Three years ago the writer, acting on behalf of the Charity Organization Society, caused to be introduced in the Legislature a bill calling for the appointment of a legislative commission to make a thorough inquiry into the administration of justice in these courts in the cities of New York and Buffalo. The Page Commission was thus created. Through two years that body made the most thorough study of the criminal courts that has ever been made in America, and during the present year secured the passage of a new inferior court act calculated to work a veritable revolution in the conduct of these tribunals.

To the Charity Organization Society it seemed that the opportunity for helpful service had not ceased with the passage of this legislation, but that great opportunities for useful aid presented themselves in securing continuity of effort and in bringing the force of public sentiment to bear in support of these and similar measures.

Accordingly, last July, by the action of its president, Robert W. deForest, and on the invitation of Otto T. Bannard, its vice-president, the Committee on Criminal Courts came into being. Three members of the Page Commission are among its members. Bronson Winthrop, the member of that commission appointed by Governor Hughes is the chairman of the new committee. Senator Alfred R. Page, the chairman of the legislative commission bearing his name, and now a Supreme Court judge, is another member, and Julius M. Mayer, counsel to the Page Commission, former attorney general of the state and a former judge of the Court of Special Sessions is a third. Two former judges of the state's highest courts, leaders of the bar, Alton B. Parker, former judge of the Court of Appeals, and Morgan J. O'Brien, formerly

JULIUS M. MAYER.

[1] Photographs of the chairman, the secretary and Mr. Seligman could not be obtained up to the time of going to press.

ALTON B. PARKER.

Supreme Court justice, add great strength to the committee. Two former assistant district attorneys on Mr. Jerome's staff, Nathan A. Smyth and George W. Schurman, bring intimate practical knowledge of the workings of these courts to the committee's service. The bar as well as the bench is strongly represented. Of the seventeen members of the committee, fourteen are lawyers. In addition to those mentioned are men like Philip J. McCook, who has given devoted service for years to the cause of the poor, both with the Legal Aid Society and the Charity Organization Society; Ralph K. Jacobs of Brooklyn, who has specialized on domestic relations problems; Ezra P. Prentice, deputy attorney general of the state and for many years a leader in the state Assembly; Frederick Trevor Hill, a close student of legal problems, and Frank L. Polk, former civil service commissioner.

The social workers of the committee are Robert W. deForest, the Charity Organization Society's president; Otto T. Bannard, its vice-president; John M. Glenn, director of the Russell Sage Foundation; Homer Folks, president of the State Probation Commission, and the writer who as secretary of the committee will have the direction of its work. Bailey B. Burritt, who has done such effective work in the study of the inebriety problem, has been appointed executive secretary and Joseph T. Williams, assistant secretary.

It will be seen that the committee to an unusual degree brings to its tasks a wide knowledge and grasp of public affairs. Of its seventeen members, fourteen either now or in the past have held public office. Made up, as it is, of democrats and republicans, of Catholic, Protestant and Jew, it is peculiarly well constituted for the tasks that confront it and it will command public confidence to a high degree.

The keynote of the committee's work is sympathetic co-operation with the magistrates, with the public, with social workers, with court clerks and city officials and with the Legislature. Its opportunities will lie in the defense of the law, protesting against amendments that weaken it, strengthening it where it shows defects, securing for its enforcement the support of the city administration, and aiding in securing sufficient appropriations. It will bring to the aid of the magistrates the force of public sentiment in behalf of the reforms contemplated, and should make possible effective aid in the further study of the many difficult questions involved.

The direction and scope of the committee's work may be realized when it is known that the committee has already organized the following ten sub-committees: on general administration, domestic relations courts, night courts, pro-

FREDERICK TREVOR HILL.

HOMER FOLKS.

ROBERT W. DEFOREST.

bation, law and legislation, buildings, children's courts, Court of Special Sessions, record system and court records, magistrates' courts and institutions.

The committee has already placed its services at the disposal of the new chief magistrates, Judges William McAdoo, Otto Kempner and Chief Justice Isaac F. Russell of the Court of Special Sessions, who view with gratification the creation of this committee and its aid in their work.

One of the things which the committee hopes to do is to aid in seeing that a fair trial is had of the provision of the new law which calls for the medical examination and treatment of convicted prostitutes (the famous section 79 of the inferior courts act which has been so much discussed in THE SURVEY. Before so important a statute is changed, its workings must be carefully studied, and the results obtained under it set before the public. This the committee will seek to do. It hopes to bring into close co-operation those various groups of earnest people who are now so much disturbed by this phase of the question. The committee has already made a special study of a record system for use in the magistrates' courts, which is now being put into operation by Chief Magistrate McAdoo and Chief Clerk Philip Bloch. In place of the old hit or miss method by which the magistrate had to trust to his memory for the previous criminal history of an offender, because there was no system of identification or indexed records, there will soon be a centralized system of card records from which at a glance the complete criminal history of every offender will be evident.

OTTO T. BANNARD.

JOHN M. GLENN.

So many of the evils of the criminal courts are inherent in the physical condition of the court buildings that a great opportunity awaits the committee in helping to develop a new type of model court house, and aiding in securing the erection of such buildings from time to time in

different parts of the city, replacing the present sadly defective structures.

As the committee's work develops it will seek to make the great mass of our foreign population aware of the new order of things, to make plain to them that special privilege, intimidation and insult in these tribunals are no more, but in their place justice and fair dealing.

NATHAN A. SMYTH.

EZRA P. PRENTICE.

JOTTINGS

School Tuberculosis Exhibits.—Massachusetts is the first state officially to undertake a special exhibition campaign against tuberculosis in its public schools. Under a law passed last winter with an appropriation of $1,000, the State Commission on Hospitals for Consumptives has prepared a series of light exhibits which will be placed in the schools of every large city and town of the state.

The exhibits, prepared under the direction of Dr. John B. Hawes, Jr., secretary of the commission, are models of compactness, economy, and efficiency in demonstrating tuberculosis. They are composed of two large panels each five feet two inches long and four feet four inches broad strongly hinged together. Each contains twenty-four frames eight inches by ten with photographs and mottoes. The exhibit costs about thirty dollars, and it can be handled easily by two men. Owing to the limited appropriation it is planned to sell these exhibits where possible to boards of education or private bodies, and where this cannot be done to loan them for six months or more. A pamphlet suggesting how to demonstrate the exhibit has been prepared. It will be sent to every teacher in the state.

In 1908, the Legislature of Massachusetts passed a law requiring "that tuberculosis and its prevention shall be taught in all grades of the public schools of this state in which instruction is given in the subject of physiology and hygiene." Except in Salem, Fall River and a few other places, no attention has been paid to this law. It has become evident to those interested in this kind of instruction that unless something is done to help the teacher, already overworked and underpaid, little will be accomplished. It is hoped, therefore, that by means of the exhibits special interest will be given to the study of tuberculosis.

National Municipal League.—The program of the National Municipal League, which is to meet at Buffalo November 14-17, will cover the address of the secretary, Clinton Rogers Woodruff, on The New Municipal Idea; discussion of the franchise question led by Robert Treat Paine; School Extension, by Edward J. Ward; City Finances, by Harvey S. Chase; Corruption in Municipalities, by William C. Osborn; the liquor question, by Prof. A. R. Hatton, the police, taxation and many other city problems. It is a broad and interesting program.

The league has recently announced that the William H. Baldwin prize for 1910-11 will be on The Administration of the Police Department in Some City in the United States with a Population of Over 200,000. The contest, which is limited to undergraduate college students, closes March 15. Full information may be obtained of the secretary of the league, Clinton Rogers Woodruff, North American Building, Philadelphia, or of the chairman of the committee in charge, Prof. William B. Munro of Harvard.

A Preventorium in the West.—The first camp or sanatorium for pre-tuberculous and anaemic children west of the Mississippi river, and one of the few in the country, has been opened at White Bear lake, about thirteen miles from St. Paul, Minn., under the management of the St. Paul Anti-Tuberculosis Committee. It was erected by Paulina Shapiro of St. Paul in memory of her daughter, and is called the Eva Shapiro Memorial Camp.

The object is to take out of their ordinary environment children whose resistance to disease has been weakened by insufficient nourishment, overwork, disease, or other causes. It might more properly be called a "preventorium," like its predecessor near Lakewood, N. J. Similar experiments have been tried in Brookline, Mass., Norfolk, New York, and other places with marked results. Usually a few months in such an institution will prevent a fatal attack of tuberculosis or some other disease.

The St. Paul institution consists of a two-story frame house, well equipped with playrooms, wards, etc., and accommodates ten boys and ten girls who are admitted through the dispensary of St. Paul.

Conference of Probation Officers.—The Third Anual State Conference of Probation Officers, under the auspices of the New York State Probation Commission, will be held in Rochester on November 15-16, just preceding the State Conference of Charities and Correction which convenes on November 15. The principal subjects will be Preliminary Investigation of Cases, Improvement of Home Conditions, Employment of Adult Probationers, and Treatment of Violations of Probationary Conditions. Homer Folks, president of the State Probation Commission, will preside, and discussion will be led by Probation Officers Frederick W. Pfeiffer of Buffalo, Richard A. Wallace of Auburn, William A. Killip of Rochester, Edwin J. Cooley of Erie, Minnie S. Fisher of Syracuse, Anne V. Roome of New York. No papers will be read, but the time will be devoted to informal discussion, divided equally between juvenile and adult probation work.

Children's Conference at Cleveland.—The first Western Reserve Conference on the Care of Neglected and Dependent Children, will be held in the Engineers' Building, Cleveland, November 17-19. Representatives from every institution in Cleveland are expected, as well as many speakers of national reputation in the field of work for children, among them Hastings H. Hart, Edwin D. Solenberger, Brother Barnabas, Martha B. Falconer and James A. Leonard. An exhibit will be given throughout the conference and the meetings for the three days will be devoted to institutions, boarding-out, adoption, and cooperation between child-caring agencies. The committee in charge hopes that a permanent children's bureau will be the outgrowth of the conference.

NEW YORK BUDGET INCREASED $11,000,000

The Board of Estimate and Apportionment of New York has passed the budget for 1911 and the annual campaign is practically over. The aldermen, subject to the veto of the mayor, can reduce the budget but they cannot increase appropriations and probably no change will be made.

The effort to keep the expenditures down to the total for last year was not successful. It was bound to fail unless the administration disregarded the growing needs of the departments. The increases in fixed charges for the debt service and for mandatory raises of salaries, together with the necessity of providing a larger appropriation for the deficiency of taxes, made it impossible to keep within the figures for last year. The increase is about $11,000,000 whereas the budget last year exceeded that for 1909 by but $6,585,000. The total for 1911 is a little over $174,000,000.

This increase is almost entirely accounted for by two items. The debt service—interest on the city debt, instalments to reduce it, and amounts payable for 1911 exceeds $50,000,000, which is over $4,000,000 more than last year. For the deficiency of taxes $10,000,000 is set aside as against $4,000,000 for 1910, largely because of the cancellation of franchise taxes by the courts. Aside from these, the net increases total much less than a million dollars. While the budget campaign was on two pertinent issues were raised. At a meeting held at the Labor Temple to urge liberal sums for the Departments of Health, Charities, Parks and Education, the necessary corollary, that is the need for new sources of revenue, was recognized and discussed by Frederic C. Howe of Cleveland. He suggested that the city appropriate through its taxing power the annual increase in land values. Though something in this direction may be properly attempted, as has been partially done in England, other methods for raising money to meet the advancing cost of municipal administration must be found.

Benjamin C. Marsh, secretary of the Congestion Committee, also pointed out that the real budget consists not only of the amount determined by the Board of Estimate and Apportionment in October, but also of the special revenue bonds issued during the year. The use of special revenue bonds is a question that needs more attention. Last October the administration reduced the appropriation requested by the Department of Public Charities. This year $240,000 has already been issued for the department in special revenue bonds. Every year the city sells bonds for this department. The issue of special revenue bonds cannot be entirely avoided, but such repetitions as this are hardly excusable. Unforeseen needs will always arise, but it was shown that purely nominal sums are voted in the budget for snow removal. The cost for this service may vary over $1,000,000 from year to year. It is possible, however, to fix a figure below which it is unlikely the cost would fall and special revenue bonds would have to be issued only to meet the excess over this sum. New York also loses much by collecting its taxes nearly a year after it has spent the money so that the city must borrow to meet current bills. To correct this would take ten or twelve years but it would be a decidedly wise policy.

Although the various departments collectively have received about what they were granted last year, a number have had their budgets reduced. In this class are included the borough presidents, the Departments of Finance, Docks, Street Cleaning, Bridges, Board of City Record, Board of Elections, Charitable Institutions and a number of other branches of the city service. Some of these departments have been notoriously mismanaged, so that economies were to be expected.

FEW INCREASES FOR CITY SOCIAL SERVICE

The Department of Health, which asked for an increase of $1,300,000, received but $75,000. This permits scarcely any additional development of the work. The Board of Estimate and Apportionment, although there has been but little public criticism and much appreciation of the efforts of Dr. Lederle and Dr. Bensel, has voted to make an investigation of the methods employed in the department. Only minor increases were allowed, which means the postponement of plans for increased service in the Bureau of Child Hygiene, and the divisions of contagious diseases, of hospitals, and of milk inspection.

The Department of Education received but $175,000 net more than last year though the gross increase exceeds $800,000, instead of a requested increase of $7,309,000. The evening schools, vacation schools, recreation centers, baths and playgrounds are again to be kept down to the sum spent in 1909. As in the case of the Departments of Health and Charities, the work of the Board of Education is to be investigated. The Board of Estimate and Apportionment for some years has felt that school affairs could perhaps be better administered. The Department of Public Charities was at first allowed an increase of but $155,000. This was much smaller than was needed as all who knew the wants of the department, including two ex-commissioners, agreed. Friends of the department made an earnest appeal at the public hearings for more funds so that the hospital helper service might be improved by increasing the absurdly low salaries now paid. In the final budget, in spite of the previous criticisms, a further increase of $260,000 was allowed, which is still less than is needed, but is a great gain over the first allowance.

The Park Department for Manhattan and Richmond asked for $78,425 for playgrounds. The tentative budget allowed only $35,000. The Parks and Playgrounds' Association made a vigorous but unsuccessful campaign to have this increased to at least $55,000.

The Tenement House Department has received $12,690 less than last year. For years the realty owners have fought the appropriations for this department, so that the commissioner has never had sufficient funds. Sometimes in previous years, when every other department has received an increase, the Tenement House Department has been singled out for cuts. The commissioner has therefore never been able to make the monthly inspections of tenement houses required by the law and this department could less afford a cut than almost any other.

The final budget made an increase of $20,550 over the tentative one for the magistrates' courts in Manhattan, which will enable Chief Justice McAdoo to install a much needed alphabetical file of those arraigned.

Altogether, though the social service departments, excepting the Tenement House Department, were perhaps fortunate not to suffer cuts, the needs of the city in the way of health, recreation, and education have not been adequately met. The departments will be able to carry on their present work but almost all improvements and additional services must be postponed.

USE SCHOOLS AS POLLING PLACES

The New York budget for 1911 provides $1,056,750 for the Board of Elections. That is, it will cost over a million dollars for the citizens to enjoy the privilege of expressing their choice between candidates for certain offices. Question has been raised as to whether this right can be exercised more economically. New York expects to pay about $125,000 in rent for polling places. Is all of it necessary?

Polling places are required for election day, four registration days, and for one or two primaries, according to the year. The present method is to rent quarters in each election district for the six or seven days required. The places used cost from five to thirty dollars a day. The amounts paid are smallest for the registration days and highest for accommodations in Manhattan on election day.

The city has buildings of its own scattered throughout the city. There are nearly six hundred schools, about fifty libraries, besides municipal structures in small parks, police station houses, district courts, armories, and the local offices of various municipal departments. There is perhaps considerable objection to using police station houses for polling places. But the suggestion of Lillian D. Wald of the Nurses' Settlement, which already has the approval of some of the school and city officials, that the municipality use its own buildings, so far as possible, for election purposes, deserves consideration. The present administration with its expressed ambition to effect economies will probably weigh the plan most carefully.

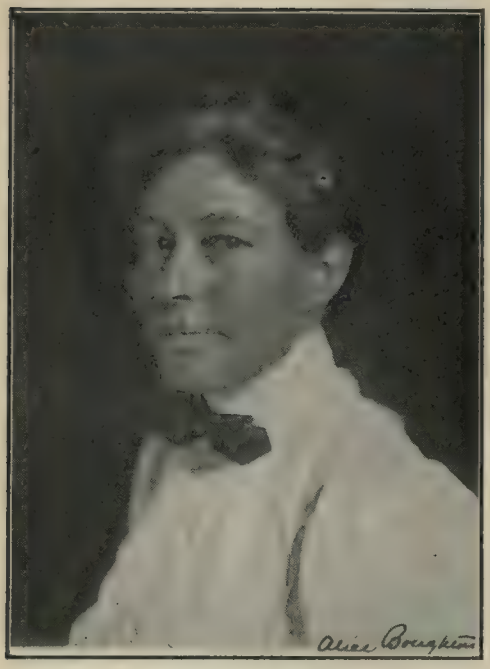
The use of the public buildings on election day, which is a holiday, would cause little inconvenience. On no one of the other days, some of which come on Saturdays, are there so many of the electorate using the polling places. In most cases it would not be difficult to make the necessary arrangements. There are not 2,000 municipal buildings, which will be the number of election districts next year, and undoubtedly some places must be rented, though not as many as a comparison between the number of public buildings and election districts would seem to indicate. The law allows two polling places in certain instances in the same building. It has been suggested also that churches be requested to give the use of their vestry rooms and probably some of the settlements would furnish quarters.

The scheme will require much work on the details and it is impossible to tell just how much saving can be effected. An advantage as important is that it would provide more dignified places for the exercise of the ballot and furnish in this respect a valuable example to other communities.

LYNN TRIES THE COMMISSION PLAN

Lynn, Mass, an industrial city of almost 90,000 population, with a background of strong New England traditions, has adopted one of the most extreme forms of commission government. At a special election on October 11, three alternatives were offered the voters: to continue the present charter with a mayor and two legislative chambers, to adopt a new charter with a mayor and a single chamber; and to change completely to a new charter by which all authority is centered in a commission of five members elected by popular vote and subject to recall on petition of 500 voters.

The last form was adopted by a decisive vote. The new charter will abolish all ward lines for election purposes, provide for the initiative and referendum and for a public meeting at which all official records and city contracts shall be open to inspection, and fasten direct responsibility on the five commissioners for the five departments of city government.



The change in Lynn did not come as a revolt from corruption in municipal affairs, but from a widespread belief that a more efficient system could be found. Discussion during the campaign was clean and instructive and popular interest was keen. The Men's Federation, which initiated the movement, quickly gained the support of influential merchants and manufacturers and of the trade unions.

Lynn, it may be hoped, will continue its interest in the new government, and will so express it as to hold up the hands of the commissioners when they come into control. The commission form of government, like all other devices for running a city, demands unflagging watchfulness and co-operation on the part of the electorate.

NEW YORK STATE TO PROTECT ALIENS

On October 1 the law establishing a Bureau of Industries and Immigration in the New York Department of Labor went into effect, Frances A. Kellor being appointed chief investigator. The bureau is the result of the recommendations of Governor Hughes's Immigration Commission, which handed in its report in April, 1909, and will continue much of the work carried on after the disbandment of the commission by the North American Civic League for Immigrants, of which Miss Kellor was secretary.

The Bureau of Industries and Immi-

FRANCES A KELLOR.
Chief Inspector New York Bureau of Industries and Immigration.

gration is founded on the conviction of the immigration commission that from the standpoint of humanity we have hitherto shown a complete indifference to the welfare of the immigrant, and from the standpoint of the state "there has been no consistent effort to utilize the tremendous accumulation of energy possessed by the army of industrious workers who bring with them an aggregate of moral, intellectual and artistic forces which, if properly directed, would advance our national ideals."

To remedy this neglect the bureau proposes to inquire into the condition of all aliens arriving in New York, to search out the demand for labor in all parts of the United States, to investigate all applications for laborers, to exercise a supervision over all employment agencies, and ultimately, by acquiring a thorough knowledge of labor conditions, to take a step toward preventing congestion and obviating unemployment. For the protection of the immigrant worker the bureau has power to inspect all contract labor camps within the state—a work already begun by Miss Kellor.[1] It will also act as an investigating agency of all philanthropic institutions now brought to bear on the immigrant and as a clearing-house for those whose activities are found to be legitimate. It will protect the immigrant at the place of landing, and will exercise control over the banker, the ticket agent, the *padrone,* and all those agencies of fraud, vice and extortion which have hitherto pitilessly exploited the alien, and, finally, it will co-operate with the education authorities in enforcing the compulsory education law and in providing instruction in English and citizenship for adult aliens.

Miss Kellor is exceptionally well equipped for this work. Besides her position in the North American Civic League for Immigrants and as secretary of Governor Hughes's Immigration Commission she served on Governor Higgins's Probation Commission, and as secretary of the Research Committee of the Committee of Fourteen on the Social Evil she supervised the investigation and prepared the report on Law Enforcement in New York. As fellow of the College Settlements Association in 1905 she made a study of employment agencies[2] in New York, Philadelphia, Boston and Chicago, which revealed a system of extortion and a connection between employment agencies and prostitution which led to the present law regulating such agencies in cities of the first class in New York state. Miss Kellor was a student in the New York School of Philanthropy, a graduate of the Cornell Law School and a graduate student in the University of Chicago. She organized the Intermunicipal Research Committee and the National League for the Protection of Colored Women.

ONE SECTION OF THE INFERIOR COURTS LAW

MAUDE E. MINER
Secretary New York Probation Association

The inferior courts law has not been in operation a sufficient length of time for us to judge whether specific sections

[1] See THE SURVEY for January 29, 1910.

[2] Out of Work. By Frances A. Kellor. 1904. New York. G. P. Putnam's Sons. Pp. 292. Price $1.25; by mail of THE SURVEY, $1.37.

are entirely good or entirely bad, or whether they have an element of good in them, even though we believe that the law as a whole will result in improvement in the court system. The section of the law most in question is clause 79, about which so much discussion has arisen. It is for us to observe with unprejudiced minds how it is administered, how it operates, and what better provision can be made. We must believe that magistrates and all other public officials who are charged with the execution of this law, are anxious to execute it in the wisest, best and most humane way.

THE TRIAL AND THE EXAMINATION

The prisoner, when arraigned, stands before the magistrate, not separated, as formerly, by the high bridge. She is advised of her legal rights and may have the case adjourned or have an immediate hearing. If the hearing is postponed, the defendant may be admitted to bail; if convicted, she is remanded for sentence. Were the adjourning of these cases to become a regular practice, a real danger might arise from the reappearing of the professional bondsman; but if girls realize that an adjournment means merely a delay in sentence, which is true if there is adequate evidence, they will be unwilling to ask for it.

Women remanded for sentence are examined by a woman physician of the Department of Health and remain twenty-four or forty-eight hours, during which time microscopic tests are made to determine the presence or absence of disease. The result of this examination is presented to the magistrate at the time of sentence.

From September 1 to October 15, ninety-three women convicted at the Night Court for Women of offenses relating to prostitution were examined by the physician. The disposition of their cases was as follows:

Committed to workhouse hospital	37
Committed to Bellevue Hospital	1
Committed to the workhouse	37
Fined	15
Committed to New York Magdalen Benevolent Society	1
Placed on probation	1
Discharged	1

THE PLACE OF COMMITMENT

Section 79 provides that if after examination by a physician "it thereby appears that the prisoner is afflicted with any venereal disease which is contagious, infectious or communicable, the magistrate shall commit her to a public hospital having a ward or wards for the treatment of the disease with which she is afflicted . . ."

Since the first commitment to Bellevue Hospital, women found to be suffering from venereal disease have been committed by the magistrates to the workhouse hospital on Blackwell's Island. No commitments have been made to the City Hospital or the Metropolitan Hospital, which have wards for the treatment for venereal disease. There are two hospital wards in the workhouse, one medical and the other surgical, having eighteen beds each, for the treatment of those women who become ill during their period of sentence. The women committed under section 79 are not in the hospital wards, but in cells near them. There are four and five in a single cell, and in one cell I counted six women. The women are locked in their cells during the day, except when they go for their meals, to help with the scrubbing of floors and cells, or for consultation with the physician. With five or six women in a cell, lying on cots without mattresses, or standing about talking, having little or no useful occupation, it is impossible for any one of them to be benefited. When I visited the workhouse October 24, girls and women with whom I spoke complained, among other things, of the lack of sanitary arrangements in the cells and said that they received little medical care.

The two physicians assigned to the workhouse are internes who come for a period of two or at the most three months. This means that those treating the women will be a constantly changing group.

The commissioner of correction has himself said that the workhouse has not adequate facilities for caring for these

women, as it has no ward for the treatment of venereal disease. We would further say that the workhouse is not a suitable place for these girls and women, because there is absolutely no reformative influence there; and that it seems to the layman's mind illegal to commit women to the workhouse under section 79, because it is not a public hospital having a ward or wards for the treatment of venereal disease.

THE TERM OF COMMITMENT

The law states that a magistrate shall commit women "for a minimum period fixed by him in the commitment and for a maximum period of not more than one year." Further provisions are that if the prisoner is cured after the minimum period and before the maximum period, she shall be discharged upon the order of the officer in charge of the institution, when the physician of the institution or the Department of Health certifies that she is cured. If cured before the minimum period expires, she shall be transferred to the workhouse and discharged at the close of that period.

Contrary to what seemed to be both the spirit and the letter of the law, sentences are being imposed for a maximum period of less than one year, as well as a minimum period, and read: "Not less than two months, not more than three months." "Not less than four months, not more than six months," "Not less then six weeks, nor more than two two months."

This means that a girl committed for a minimum period of two months and a maximum of three months may leave the institution at the close of the three-month period, whether or not she is cured of the disease. We know that women will not be morally cured in a period of three months in the workhouse and we cannot expect physical cure in that time, except in rare instances. Consequently, the woman who is not morally helped and who is not physically cured may return in her diseased condition to a life of prostitution.

BEDFORD REFORMATORY

The last sentence of section 79 reads: "Nothing herein contained shall be construed to limit the authority of a city magistrate to commit any prisoner for an indeterminate period to any institution now having authority by law to receive inmates for detention for a period of more than one year."

Another section of the law provides that a woman "between the ages of sixteen and thirty convicted of habitual drunkenness, of being a common prostitute, of soliciting on public streets or places for purposes of prostitution, of frequenting disorderly houses or houses of prostitution, or of vagrancy" under a special section, may be committed to the State Reformatory for Women at Bedford. The maximum period of commitment is three years and parole within a shorter time is conditioned by good behavior.

Those who have visited Bedford know what an excellent institution it is, situated in the open country, with the cottage system, industrial work to prepare women to earn their living, classes of various kinds, a wholesome moral and social atmosphere and a hospital to provide proper treatment for those in need of medical care. Since we are aiming not to punish those who have erred but to help them, not to cure their bodies alone but to influence and affect their characters and lives, why not commit women to Bedford where there will be chance for moral as well as physical cure?

The law is very clear with regard to the power of a magistrate to commit to this institution, and it is only necessary to have the proper evidence to convict, so that decision will not be reversed if appeal is taken to the higher courts.

CONCLUSIONS

In making a fair trial of section 79, let the following conclusions be considered:

1st. The workhouse has no ward for the treatment of venereal disease; therefore, commitments should not be made to the workhouse hospital.

2nd. The period in which venereal disease can be cured cannot be definitely determined; therefore, a maximum term of sentence should not be named by the magistrate.

3rd. The state provides for the moral teaching, industrial training and medical treatment of women delinquents; therefore, commitment should be made to the New York State Reformatory at Bedford.

SOCIAL SERVICE IN THE EPISCOPAL CHURCH

JOHN M. GLENN

At the General Convention of the Protestant Episcopal Church recently held in Cincinnati its Joint Commission on the Relations of Capital and Labor submitted a report which accepts social service as an essential need in the life of the church. The formation of thirteen diocesan social service commissions is significant of the growing appreciation of the importance of an active practical interest in social conditions. The reports of these commissions show that they have been thoughtfully studying questions of public health, of housing, of amusements, of the social evil, of hours and methods of labor, especially the labor of women and children, as well as other vital matters. They have also been putting themselves into touch with other agencies and have done effective work in helping to procure legislation and in forming public opinion. The showing is not as great as it might be, but it marks encouraging and intelligent progress.

The report of the commission endorses the recommendations of the Federal Council of Churches as to reductions of hours of work, release from employment one day in seven and a living wage. It says:

> We are convinced that the church must throw her chief emphasis upon the value of human life. This is but reiterating what we have already quoted from the Lambeth Encyclical. The property right is merely one conferred upon the individual by the community. Morally it exists only in return for social service. It must in every case yield to the needs of humanity. No business interests, no profit however great, can warrant the deliberate deterioration of human life. Such a principle has clear implications. To illustrate from facts recently brought in a startling way before the public: No Christian employer can find valid ground for conducting an industry which requires or even permits the regular employment of men for twelve hours a day, seven days in the week, at a wage which necessitates the work of women and children that the family may live.
>
> Christian society ought not to permit the existence of any industry which cannot succeed without the labor of women or children under unnatural conditions. "Inasmuch as ye have done it unto one of the least of these my brethren," is the final test of our Christianity. The first care of the Christian employer should be not his profits but his men. He should think not so much of getting work out of them as of helping to form those habits of industry which contribute to health and character.
>
> The same principle governs the church's message to the laborer. It is her business to help him to understand his own struggle and its meaning. He must learn that it is development of the whole man which gives his struggle dignity. The better physical conditions and the opportunity for recreation and education and family life which he seeks, are not ends but means to the end of better men and women. His unions are justified through seeking such an end. When, therefore, he seems to stand for mediocrity, for the diminution of opportunity for individuals, for a purely class interest and spirit or for violence, the church must equally reprove. When in ignorance that his whole present advance springs from the Life which the church preserves for the world, he attacks her or neglects her, she must reach out in tenderness to win him back. Only in sympathetic touch can the church find the way to that hold upon the life of the laborer which she has so largely lost.
>
> The final solution of all the problems which these remarks suggest lies, we believe, only in the steady increase of the power of Christianity in the community. The power of the Christian ideal of life and the supreme value of every human life, let the church show forth the one and proclaim the other, and her work will be well done.

On its recommendation the convention unanimously adopted the following resolution:

> Resolved, that a Joint Commission on Social Service be appointed, consisting of five bishops, five presbyters and five laymen. It shall be the duty of this commission to study and report upon social and industrial conditions, to co-ordinate the activities of the various organizations existing in the church in the interests of social service, to co-operate with similar bodies in other communions, to encourage sympathetic relations between capital and labor, and to deal according to their discretion with these and kindred matters.

Later power to add to its numbers was given the new commission. Among the members of the commission are the Rev.

George Hodges, D. D., the Rev. E. L. Parsons, the Rev. W. T. Sumner, the Rev. J. Howard Melish, the Rev. F. H. Nelson, and Messrs. Gifford Pinchot, Jacob Riis, George Mather, R. S. Morris and W. F. Morgan. The House of Bishops on motion of Bishop Greer of New York unanimously adopted the following:

Whereas, the employment of children in factories, mines and shops reduces wages to the child's standard, disintegrates the family, deprives the child of his natural rights to a period of training and time for play, and depreciates the human stock; and

Whereas, we recognize the responsibility of the church for our industrial as well as our spiritual standard; therefore, we call upon employers and parents to use all influence toward better legislation and better enforcement of the laws for the protection of children, to the end that exploitation of the labor of children shall become impossible in this Christian country; and

Whereas, we believe a special injustice against the child exists in the night work of boys under eighteen, in the transmission of messages, and especially in the distribution of our daily morning papers, between the hours of 10 P. M. and 6 A. M.; therefore, we call upon all Christian legislators to make laws forbidding this work of children under eighteen, between the hours of 10 P. M. and 6 A. M., in the various communities of our nation.

On October 20 a conference of diocesan social service commissions held three well attended meetings. At the opening meeting Bishop Lawrence of Massachusetts declared that church unity and missions are inextricably tied to social service. The Rev. Alexander G. Cummins of Poughkeepsie said that wages have travelled in a prairie schooner, profits in a Pennsylvania Limited. Clinton Rogers Woodruff urged coordination of the social work and agencies within the church and with outside agencies. He showed the necessity for the establishment of a permanent office for the new commission with a general secretary in charge to guide and stimulate general and local organization and work, a suggestion which was unanimously adopted and recommended by the conference.

At the afternoon session the Rev. Charles N. Lathrop of California said that a church should bring to its membership a wide and accurate knowledge of conditions in its community, and develop in them a new civic and business conscience. Dean Sumner of Chicago urged close co-operation between churches and better equipped public and private social agencies, such as school boards, health boards, jails, associated charities, child labor committees and consumers' leagues. Clergy and laity should be better acquainted with problems of city administration and expenditure as well as with labor problems.

The Rev. Theodore I. Reese of Columbus, O., in a well balanced paper on Capital and Labor put squarely upon the church the responsibility to understand clearly the conditions under which men and women labor and to work for their improvement in a definite and practical way. The church has a great power as an impartial leader to strengthen what is right and wise and to lessen wrong and foolish methods.

Among others who took part in the discussion were Dean Hodges of Cambridge and H. D. W. English of Pittsburgh. The latter told of the valuable share that members of Calvary Church, known as "the Calvary crowd," had taken in cleaning Pittsburgh politics.

At night a public meeting was held. Bishop Williams of Michigan opened the meeting with the following words:

Popular Protestantism is too much concerned with individual salvation. Environments exist in which it is as impossible to grow and develop a Christian character as to grow a rose in an ash barrel. We cannot preach chastity without considering the tenement house problem, or temperance without realizing that poverty leads to drunkenness, as well as drunkenness to poverty.

The church has its social responsibility. But it has more than to minister to the wounded. It is more than a train of Red Cross nurses. It has got to go below the surface and reveal the causes of the strife and witness for social justice as well as minister. We need a new version of the Good Samaritan. It is high time the church saw the Jericho road cleared of thieves and robbers.

Bishop Anderson of Chicago said:

We must individualize our responsibilities before we can socialize our Christianity. The first great need of the present is to fix the responsibilities—to point out the man in the city, the state or the corporation who outlines the policy.

We must have a social gospel to meet the times. It is the old gospel applied to the

present. Though we see thousands of pure women suffering with dread diseases and boys and girls led astray, I am surprised sometimes at the silence of the church just because the subject happens to be an unpleasant one.

Three things stand out in this convention far above suffragan bishops and the other business, three great streams of thought. First is Christian education, second is Christian unity, and third social righteousness. All stand together. We have got to give Christian children to the world or the church will go out of business. We must have church unity or the church will lose its power. How can it bring out the gospel of social service when so much weakened by division? The church must take the social doctrine or the Christian church will be found ineffective in our midst.

Dean Hodges of Cambridge, and John B. Lennon of Washington, treasurer of the American Federation of Labor, also made addresses.

The spirit of the meeting was one of earnest desire for fuller information, intelligent personal contact with difficult social situations and a bold stand on questions of principle. It is the first conference of the kind held in connection with a general convention of this church. It is likely that when the next convention meets in 1913 in New York there will be commissions in every diocese and that the general conference will be much larger and more important than this one. A pleasant feature of the meetings was the frequent reference to THE SURVEY as an essential part of the equipment of church workers, and the recognition of the value of the work of organizations doing social work outside the church.

THE CHURCH FOR INDUSTRIAL BROTHERHOOD

GRAHAM TAYLOR

Perhaps the most significant and farthest reaching event of the month in the industrial life of the American people is the unanimous action by a rising vote taken by the National Council of Congregational Churches in Tremont Temple, Boston, October 14, by which a declaration of industrial faith was made and a policy of action adopted.

Twelve years ago the International Council of the same body received, with marked division of sentiment and several antagonistic speeches by some of the most prominent men of the denomination from both sides of the sea, essentially the same plea to take the same attitude toward the same moral and social issues. Then, however, no definite practical action was proposed. Perhaps the specific proposition that the Congregational brotherhoods should assume the function of executive agencies for the churches may in part account for the changed front of the delegates. But the unanimity and enthusiasm with which both the National Council and the Brotherhood Convention took this advanced stand and struck out their progressive action indicate a great change in the point of view, and the attendance of a larger proportion of delegates from the oncoming generation. Many men of the elder generation, however, were on their feet in this rising vote. A few of them were indeed the old "war horses," who like Washington Gladden had led the charge all along the line, but most of them, laymen as well as ministers, had changed their minds or "made up" their minds, perhaps all imperceptibly to themselves. At any rate the imposing fact was registered that the ranks were unbroken by a single negative vote or by a single dissenting vote in this most representative body of the sons of the Pilgrim Fathers.

The report of the committee on industry which led up to this action confronted the churches at the outset with the ethical demands of the industrial conditions and relationships which so largely constitute and determine human lives. It showed how largely the sins, the strifes, the diseases, the vices, the legislation, the leadership and the brotherhoods of the age are industrial. It described the responses which the churches, abroad and in this country, are making to this challenge of the new times. It claimed that with such initiative and accomplishment as the Congregational churches have achieved throughout their history in the sphere of educational, civic, political, reformatory and constructive action, the time had now come for them to act in the industrial sphere.

The first of four recommendations toward a policy of action dealt with a

declaration of principles. Instead of formulating one of their own, the churches were wisely urged to adopt the declaration of the Federal Council of the Churches of Christ made at Philadelphia December 2-8, 1908, which was summarized as follows:

DECLARATION OF PRINCIPLES.

We deem it the duty of all Christian people to concern themselves directly with certain practical industrial problems. To us it seems that the churches must stand:

For equal rights and complete justice for all men in all stations of life.

For the right of all men to the opportunity for self-maintenance, a right ever to be strongly safeguarded against encroachments of every kind.

For the right of workers to some protection against the hardships often resulting from the swift crises of industrial change.

For the principle of conciliation and arbitration in industrial dissensions.

For the protection of the workers from dangerous machinery, occupational disease, injuries and mortality.

For the abolition of child labor.

For such regulations of the conditions of toil for women as shall safeguard the physical and moral health of the community.

For the suppression of the "sweating system."

For the gradual and reasonable reduction of the hours of labor to the lowest practicable point, and for that degree of leisure for all which is a condition of the highest human life.

For the release from employment one day in seven.

For a living wage as a minimum in every industry, and for the highest wage that each industry can afford.

For the most equitable division of the products of industry that can ultimately be devised.

For the suitable provision for the old age of the workers and for those incapacitated by injury.

For the abatement of poverty.

To the toilers of America and to those who by organized effort are seeking to lift the crushing burdens of the poor, and to reduce the hardships and uphold the dignity of labor, this council sends the greeting of human brotherhood and the pledge of sympathy and of help in a cause which belongs to all who follow Christ.

By happy and unprecedented coincidence, an almost identical recommendation came up to the council of the churches and to the convention of the brotherhood to the effect that neither should undertake anything that could be done better by the Federal Council of the Churches of Christ in America acting in an interdenominational capacity. All the denominational agencies therefore were recommended to co-operate with this body representing all Protestant denominations, in all matters requiring interdenominational expression or action. This policy was urged "in order that the churches shall present a united front to organized employes and employers and to state legislatures in any situation requiring the declaration of Christian principles for co-operative effort." It is hoped that serious confusion may thus be averted which certainly would have followed denominational action independently presented to industrial bodies or to the public. One practical line of co-operation was authorized to enable the Federal Council's committee on literature to issue a press bulletin to daily and weekly trade, labor and other papers, for the purpose of presenting to their readers and the public the Christian ideals, standards and spirit applicable to industrial conditions and relations.

While the national and state ecclesiastical bodies were urged to appoint and promote the efficiency of "committees on industry," the Congregational Brotherhood was requested to assume the function of executive agency for the churches, "in order to promote the study and knowledge of local industrial conditions and relations, to enlist the membership of the local chapters and the churches in practical efforts for the improvement for these living and working conditions, in accordance with the Christian principles, the declaration of which is made jointly with the United Churches of Christ in America."

The Brotherhood Convention assumed this function with enthusiasm, and at once proceeded to raise funds adequate to maintain the office of a secretary for labor and social service, for which the best available man is being sought. The committee to whose administrative care this industrial policy is entrusted is composed of men representing employers and employes, ministers and laymen, and both country and city districts in eastern, western and southern states.

THE NEW WORLD AND CRIME[1]

EVELYN RUGGLES BRISE

PRESIDENT-ELECT OF THE INTERNATIONAL PRISON COMMISSION

This coming of the Old World to the New to learn what lessons the New has to teach is an historic fact and may be an epoch in human thought and attitude towards the criminal. It has been a great education and profit to me to realize what a fund of humanity and benevolence is being applied in the United States at the present time to the rehabilitation of the offender. This is not, if I may quote from a well known passage in John Morley's life of Voltaire, "humanity in its pale shape of kindly sentiment and bland pity, but humanity strong, aggressive and alert stalking the land like ancient heroes to slay monsters." The monsters which we all are trying to destroy in our respective countries are bad prisons, bad laws and bad criminal procedure. With this humanity, goes the remarkable hopefulness of the American in the rehabilitation of the offender. This, I think, has an origin partly religious and partly political. It is the spirit of the Good Samaritan which holds out a helping hand, and the civic spirit which desires to recreate good citizenship and to convert prisoners into useful assets in the community. This hopefulness, strengthened by these two influences, is a tremendous force, of which the value will be in the method of its application.

SIR EVELYN RUGGLES BRISE, K.C.B.,
President of the English Prison Commission, who at Washington was elected president of the International Prison Commission to succeed Professor Henderson.

If Europe has adhered too closely to what is known as the Classical School in its attitude toward the criminal, or if America has broken away too much from tradition, here, if ever, is the occasion where the balance may be adjusted, and once again in history, the one world may be used to redress the balance of the other.[1] What is that balance? It is a common recognition by all countries of the purpose and meaning of punishment. Is America prepared to accept the old-fashioned European formula that punishment shall be retributory, deterrent and reformatory in this order?

By retributory, of course, I do not mean the vulgar and exploded instinct of vengeance or personal revenge, but the determination of the human con-

[1]The substance of an address before a general meeting of the American Prison Association, October 2, 1910, to which delegates of the International Prison Congress were invited.

[1]"I called the New World into existence to redress the balance of the Old." Canning, referring in 1826 to England's acknowledgment of the independence of the South American republics in 1823, while he was prime minister.

sciousness that the system of rights shall be maintained, that he who offends against it shall be punished, and that the punishment shall be of such a nature as to deter him and others from anti-social acts.

By reformatory, I mean the accepted axiom of modern penology that a prisoner has reversionary rights of humanity, and that these must be respected consistently with the due execution of the law, and that no effort must be spared to restore that man to society as a better and a wiser man, and a good citizen. Among loose thinkers and loose writers the impression seems to be gaining ground, that this historic order of the factors of punishment should be inverted and that the object of punishment shall be altogether reformatory, as little as possible deterrent, and not at all retributory.[1] It is only by preserving this balance that we can hope to follow the wise advice given to us by the president of the United States, that we must try to steer a middle course between "maudlin sentiment on one side and a desire for vengeance (that is cruel, unnecessary and unprofitable punishment) on the other."

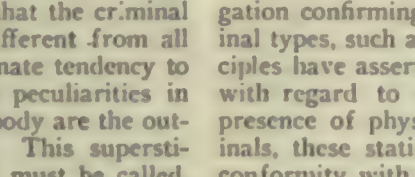
This question of preserving a common balance is my first reflection. My second is with regard to the indeterminate sentence and the parole law. Can we agree as to the rôle to be played in the future by the judicial and executive authority respectively? Can the wisdom and discretion of our judges be respected consistently with the intervention of non-judicial authority in the determination of penalty? Here is a great battle ground for the future, and it may be that Europe is not prepared to go as far as America in this respect. My third reflection is, will America be prepared to adopt the same tests as European countries, as to the success or failure of any new plan that may be proposed for the treatment of crime? In other words, will America be willing to have her institutions tested by full and accurate and annual statistical data of convictions and re-convictions, as they are tested in Europe and as public opinion insists that they shall be tested?

My fourth reflection is, whether in order that there may be a complete comparison of rival systems for dealing with crime, it is possible, or likely, that America will follow the lead of Europe and adopt the principle that the state as supreme authority shall be responsible for the treatment of crime in all its manifestations; that is, petty as well as serious crime. In England, our problem is more with petty than with serious offences; with the hundreds of thousands who flock to the local prisons over and over again for perhaps trivial breaches of the law and under short sentences. It is on this problem that today our secretary of state, Mr. Churchill, is bringing the vigor and humanity and ability with which he is so richly endowed to bear. The solution is to be found in classification and in differentiation; not in using the rusty instrument of imprisonment for short periods as the panacea for all and every kind of disorder or anti-social conduct; but to classify by groups, vagrants, drunkards, defectives, and to provide special institutions for special categories of offenders. Can America help us to solve this problem? Not, I think, until you recognize that the petty offender or the prisoner awaiting trial is as much a matter for state concern and control as the man under long, or indeterminate sentence, upon whom you are now expending so much thought and labor and expense in your state prisons and state reformatories.

And lastly, there is, I think, one common principle from which we can all start forward today in our campaign throughout the world; that is, the common belief in what is known—to borrow a French phrase—as "the individualization of punishment." By that I mean that each man convicted of crime is to be regarded as an individual, as a separate entity or morality, who by the ap-

[1] In his address, Sir Evelyn commended to the notice of his auditors the first number of the *Journal of the American Institute of Criminal Law and Criminology* in which the balance to be observed in the three factors of punishment is prescribed by Prof. T. H. Green of Oxford University. He regarded it as "a happy augury that the New World and the Old will be in agreement on this point" that the first number of this review should be prefaced by an extract from the writings of "one of the clearest and profoundest thinkers of the end of the last century."

plication of influences or discipline, labor, education, moral and religious, backed up on discharge by a well-organized system of patronage, is capable of reinstatement in civic life. In other words, there is no "criminal type."



Nothing in the past has so much retarded progress as the conviction, deeply rooted and widespread, that the criminal is a class by himself, different from all other classes, with an innate tendency to crime, of which certain peculiarities in the configuration of his body are the outward and visible sign. This superstition, for such I think it must be called, was, as you know, strengthened and encouraged by the findings of the Italian school. It is not based upon disinterested and exact investigation; and not only has the progress of the science of criminal anthropology been retarded by this conception, but it accounts for the unfavorable and sceptical attitude which we still find in many places towards any attempt to reclaim the criminal. It is my own belief that the assumed co-relation between the mental and physical characteristics of a man is a superstition and a fallacy. I do not believe that a murderer can be revealed by his frontal curve, or a thief by his bulging forehead or the shape of his nose.

In England we have been at great pains, during the last two or three years, by scientific and exact investigation to disprove the popular conception of the criminal. We have personally examined three thousand of our worst convicts, men sentenced to penal servitude and guilt of every form of crime. With regard to each we have collected and tabulated no less than ninety-six statements, that is, measurements, family history, mental and bodily characteristics, etc. The tabulation is now proceeding at the Biometric Laboratory of University College, London, under the direction of Dr. Carl Pearson. The results will be published shortly, and we are only able to say at present that so far no evidence whatever has emerged from this investigation confirming the existence of criminal types, such as Lombroso and his disciples have asserted. And, in fact, both with regard to measurements and the presence of physical anomalies in criminals, these statistics present a startling conformity with similar statistics of the law abiding classes. The results of this investigation will be what perhaps most of us would have anticipated, but as scientific data they will serve to break down the vulgar superstition or tradition that criminals are a special type, and as such in many cases beyond the reach of reform.

This will encourage us in our work toward the individualization of punishment. It strengthens the common principle on which we are all working; it gives us faith and hope; and of all the prison systems of the world, that will be the best where the arrangements admit of the greatest individual attention being given to each individual case.

These, gentlemen, are my reflections. I do not criticise and am not presumptuous enough to advise. In the great march forward of the International Congress, let us find, if we can, a common ground to work on. Let us understand each other, separated as we are by language, tradition and distance, for it is only by such mutual understanding that the results of this great humanitarian movement can be real and lasting.

A PRISON PROGRAM.

[Every gaol, every prison should be a reformatory. Our object should be, 1st, make our gaols and prisons perfect as reformatories and then to have them empty!

J. S. GIBBONS,
Chairman Prison Board of Ireland.]

ENDING THE REIGN OF TERROR

INFLUENCE OF THE STUDY OF THE RESULTS OF PRISON PUNISHMENTS ON CRIMINAL LAW AND JUDICIAL DECISIONS

GEORGE W. KIRCHWEY

DEAN OF THE FACULUY OF LAW, COBUMBIA UNIVERSITY

The statement of my theme involves two fundamental assumptions, both calling for examination: the first, that the system of penal imprisonment involves results requiring and capable of investigation; the second, that the study of those results may be expected to bear fruit in the modification or amendment of the law by which that system is created and supported. And as our criminal law is the expression either of the public will or of the will of certain ascertainable elements in the community, there is a further implication that that will is modifiable and capable of being influenced by the facts that may be brought to light by the study proposed.

These assumptions are, indeed, the axioms of our science and it is because we accept them unreservedly that we are assembled here on this occasion. But, if I rightly apprehend the aims and purposes of this congress, we are not here primarily as propagandists, but as men of science, and as such we may not accept even the axioms of our high calling without examination of their scope and the method and limits of their application to the problems which we have set ourselves to solve.

What I have proposed to myself as the object of this paper is an analytical study of the conditions affecting the progressive reform of our criminal law and procedure with special reference to the agencies through which such reform must be effected and the motives which affect those agencies. The obvious recourse in such an inquiry is history, especially the history of the criminal law and its administration. But, while the study of our Anglo-American legal history throws a flood of light on the relations between public opinion and criminal law, it has, I venture to think, a disappointment in store for those who look to it for a confirmation of the thesis at the head of this paper. There is, in fact, little to support the view that our criminal law and procedure have been largely determined by experiments with punitive measures. We have a record of a thousand years in which the tide of brutality ebbs and flows, but there is no sign of any reaction of the known conditions of prison punishment on the agencies making for the amendment of the criminal law, either on grounds of humanity or of expediency, up to the beginning of the last century. It was not until the humanitarian sentiment, which has attended the growth of our western civilization, had risen to a flood that it began to percolate into that last bulwark of barbarism. In that long period of waiting for the dawn of the new day, the attitude of the law toward the criminal, which can only be described as one of ferocity, fairly reflected the sentiments of horror and hatred with which he was regarded by the law making elements of the community.

Here we may profitably turn to a few moments' consideration of the agencies by which the character of the criminal law is determined. We are in the habit of speaking of law, especially under a popular form of government, as the expression of public opinion, but a study of our criminal jurisprudence shows that public opinion, in the sense in which that phrase is commonly employed, as a general sentiment pervading the community, has upon the whole had little to do with either the content or the administration of that system. Professor Dicey has recently reminded us[1] that the opinion which directs the development of the law may not be the opinion of the community at large but of a ruling class or of interests powerful enough under existing political conditions to make their influ-

[1] A. V. Dicey. The Relation Between Law and Public Opinion in England, 1905, p. 9.

ence controlling. It is submitted that the criminal law of England and the United States, as it now exists, is in the main representative, not of the will of the community as a whole, but rather of class sentiment and particularly of the sentiment of those—criminal judges and prosecuting attorneys—to whom the administration of the criminal law is committed. The attitude of the public has been negative, one of callous indifference to the fate of the wrongdoer, while the professional opinion, by which that fate was mostly determined, has been but too firmly convinced of the wisdom and justice of the Draconian code which it administered.

There are indeed, facts which seem to point to public opinion rather than to the more obdurate professional opinion as the agency of amelioration, but this, I believe, is a mistake. The slowness with which public opinion is formed, its sluggishness and discontinuity will probably continue to give the interested and professional classes a controlling influence on the course of the criminal law and its administration, and it would seem to be the part of wisdom for those interested in criminal law and prison reform under ordinary circumstances to address themselves to the task of educating and forming the professional and expert opinion upon whose attitude so much depends.[1]

But before we undertake this task, or the much more difficult one of informing and rousing public opinion, it is incumbent on us to pause and inquire what the best method of approach may be; and it is here that our real difficulties begin. For the opinion, public or professional, which sustains our present penal system is based on certain set beliefs or convictions as to the true and proper end of punishment for crime and these beliefs are many and widely divergent.

The policy of punishment by imprisonment, for example, may be supported on one or more of the following grounds:

(a) As a vindication of the outraged peace and dignity of the state and (a[1]) as an expression of its reprobation of the offense committed.

(b) As an example of evildoers and thus a restraining influence on others tempted to commit crime.

(c) As a salutary lesson to the offender, to bring home to him the truth that the way of the transgressor is hard.

(d) As a forcible means of restraining the offender, thus preventing him during the period of his confinement, from further indulgence of his criminal propensities.

(e) As a means of moral amendment, that the soul may be purged through suffering.

(f) As creating a break in the habits and associations which have led to crime.

(g) As furnishing an opportunity to bring new and more wholesome influences to bear on the wrongdoer in the hope of converting him into a useful member of society.

It is no part of the purpose of this paper to attempt a valuation of the several ends to which prison punishment may be directed; all of the ends enumerated above are valid and we can all agree that as many of them as possible should be aimed at in a properly devised penal system. My aim is the more modest one of indicating briefly what the study of conditions past and present may be expected to teach us with respect to them and how that study may be most advantageously directed.

First, as to the vindictive or retributive theory, it is obvious that it does still, to a considerable degree color our criminal jurisprudence and that the principles upon which it is founded do in fact enter to a considerable extent into the sentiments of those elements in the community by which our criminal law is actually shaped and administered. That there is a place for these principles in a sound system of penal law has already been asserted. That society shall in some commanding form give expression to the moral principles on which it is based may, however, be admitted without yielding assent to the doctrine of moral responsibility involved in the vindictive principle

[1] Much may be hoped in this respect from the new American Institute of Criminal Law and Criminology, which has many judges and lawyers among its members, and from scientific gatherings such as this where eminent jurists, criminologists and prison reformers meet and discuss with calmness and high intelligence the problems in which they are all equally interested.

November 5, 1910.

of punishment or to the consequences deduced therefrom.

I venture to suggest that there are two well-defined fields of study which may lead to fruitful results. The one, the investigation of the social and personal history of the individual wrongdoer, including his heredity and pathology, physical and mental. A demonstration of the fact, which we may well consider indubitable, that criminal conduct is usually, if not always, the result of conditions more or less beyond the control of the delinquent, cannot fail to shake the theory of moral responsibility upon which the vindictive idea of punishment is based as well as to allay and in time overcome the feeling of resentment which such conduct now excites. And, on the other hand, a study of the psychology of the mob and of the reaction of the existing penal system on the moral sense of the community will show how far it is safe to go in mitigating the rigors of the criminal law in a given jurisdiction. The prevalence of lynch law in certain communities in which the administration of the ordinary criminal law is loose and ineffective, would seem to point to the existence of a demand for vigorous dealing with crimes of certain sorts, for such time as may be required to bring the community to a better appreciation of the nature of crime and the conditions that determine it.

Second, as to the exemplary or deterrent theory, the doctrine that punishment is inflicted on the offender as a warning to others has come to be the orthodox view of the object of punishment. It is the view advocated by such eminent authorities as DuCane[1] and Cox.[2] It received its most pointed expression in the observation addressed by the Heath judge to a criminal on whom he was passing sentence: "You are sentenced to be hanged, not because you stole a horse but in order to prevent others from stealing horses."[3] There is something touching in the unquestioning faith of the legal profession, on the one hand, and of the man in the street, on the other, in the efficacy of this vicarious suffering for crimes not yet committed. Yet it remains a matter of faith, as yet unsupported by evidence. The proof furnished by experience is wholly negative—that the deterrent effect of punishment, if any there be, does not depend on the degree or kind of penalty inflicted, or rather, that excessive punishment defeats its own end by inducing a kind of reckless disregard of consequences as well as by stimulating a hatred for the law because of its injustice and oppressiveness.

I must confess that I can see no fruitful field for investigation of this question. That the certainty or even the probability of swift detection and punishment would in many instances deter from wrongdoing is a fact that needs no demonstration, and on the other hand it may be assumed that the rare prospect of punishment, following a still rarer discovery and conviction, exerts about the deterrent influence that it might be expected to. Until our police and detective methods and our criminal administration reach a point approaching scientific precision, we may wisely defer the scientific study of the most difficult and elusive of the problems of penal science.

Third, as to the deterrent effect of punishment on the offender (a secondary object of punishment according to Du Cane, Cox and other authorities), we already have data of considerable value in the statistics of recidivism. The fact that a very large proportion—in some countries more than fifty per cent—of criminals under confinement have previously undergone prison punishment seems to indicate that as a deterrent punishment by imprisonment leaves something to be desired. The inquiry into recidivism with respect, on the one hand, to the kind of offenses repeatedly committed, and, and the other hand, to the nature of the imprisonment—whether separate or communal, whether in idleness or at hard labor, etc., etc.—might profitably be continued. This may lead to certain inferences as to the extent to which prison conditions have been responsible for the vicious life which converted the first offender into a

[1] Sir Edmund F. DuCane, The Punishment and Prevention of Crime.
[2] Edward W. Cox, The Principles of Punishment.
[3] DuCane, 2.

recidivist, and may to some extent modify the unfavorable conclusion as to the deterrent effect of punishment, pure and simple, upon the individual subjected thereto.

Fourth, the principle of preventing further violations of the law by the confinement of the lawbreaker has played a considerable rôle in our criminal jurisprudence and has furnished a justification for sentences of long imprisonment in the case of hardened or desperate criminals. Of course the remedy is efficacious while it lasts, the principal objections to its application being that it has not in the past been based on any adequate study of the criminal and of the conditions determining his criminal career, and that it has not been attended by corrective and reformatory influences. This reproach to the system has now to a large extent been removed by the new sciences of criminology and sociology and by the rise and development of the reformatory treatment of criminals, and these conditions have rendered possible the extremest application of the principle of preventive restraint—the indeterminate sentence. Here in the prison and subsequent history of the criminal is a new and inviting field of study which may be expected to produce rich results.

Fifth, the principle that punishment for crime may, quite apart from the fear inspired and without the addition of reformatory influences, be a means of moral amendment finds expression in many judicial utterances. It is obviously a well-meant but mistaken attempt to bring the sanctions of the moral law and of the ecclesiastical dispensation to the aid of the criminal law. As the soul is purged by suffering, as the contrite heart is purified by penance, so may the criminal find means of grace in the pains and penalties imposed by the law he has violated. Of course this doctrine imputes to the law a sanctity which the criminal who finds himself in its toils would be the last to concede to it, and so, quite apart from the vile and degrading conditions under which this work of grace was to be effected, it is not to be wondered at that we find no traces of its efficacy. It is, perhaps, within the bounds of possibility that under a penal system in which self-respect and manhood are restored there may come to some of those who undergo that discipline, a sentiment of gratitude which will transmute the punishment into a means of moral regeneration.

Sixth, the theory that confinement in prison for a longer or shorter time is an efficient means of weaning the criminal from the habits and associations which have brought him to a life of crime has had little to commend it during that long period—unhappily not yet past—when the prison supplied associations and inculcated habits as vile and demoralizing as any that existed outside its walls. Under the new dispensation, which we are here to hasten, the theory acquires a new meaning which makes it susceptible of wide application. Even where the influences of prison life are purely negative and the prisoner is merely protected against moral contamination (if such a condition can exist), the principle is a valid one. Where, in addition, reformatory influences are brought to bear, we find ourselves under the benign conditions which will be next described. A study of the domestic and social environment of the individual criminal, especially in the case of a first offender, will throw light upon the question of the length of confinement necessary in a given case to permit the dispersion of the group of bad companions who may be responsible for his downfall or to permit charitable or other social agencies to create more favorable conditions to receive him on his release.

Seventh, the principle of the reformation of criminals during imprisonment claims to attain all the proposed ends of prison punishment in so far as those ends are attainable and desirable, and to provide conditions which make some of them feasible and salutary when without its aid they would fail of their object or prove pernicious in operation. It does not assume that all criminals are susceptible of reformation or even of improvement, nor that those who are can all be brought up to the same level of good citizenship. It does assume, however, that most men and women and all children will respond to the steady pres-

sure of a wholesome, uplifting environment, and that the vast majority of those who come under its influence are capable of becoming useful members of society, and it has already, in the brief term of its experiment, proven its faith by its works. It has opened up a vast field of investigation and study—the field of human nature, in its normal and its abnormal manifestations. It must have cognizance of the life-history of every individual committed to prison, with his heredity and environment. It studies him in prison—his needs, his capacities, his aspirations, his mental and moral equipment, his health and his reaction to the various experiences of prison life; it follows him after his discharge and studies further the effect upon character and circumstances of his experience of life as a free man. It levies on all the sciences that deal with man—law, medicine, criminology, sociology—and seeks through these to interpret and generalize the extensive data so gathered.

We are now prepared to answer the question of the influence of the study of prison punishment upon the criminal law of England and the United States. As has been said above, no change in the law of any importance can be traced to the study or to the general knowledge of prison conditions prior to the last century. It was due to such study, however, that prison conditions in themselves underwent important changes beginning in the last quarter of the eighteenth century and continuing without interruption down to our own time. It was the breakdown of the Australian convict system that marked the first feeble beginnings of legal (as distinguished from prison) reform in England about the middle of the last century and the same feeble and tentative gropings toward better things appeared in this country in the barren period from 1825 to 1869 when the act establishing the Elmira Reformatory was passed by the New York Legislature. It is from this latter date that we must reckon the period of criminal law reform based on a consideration of the effects of prison punishment on the criminal and on the community at large. It was the shocking conditions of prison life and the moral contamination in which they resulted that have given to the world the Elmira system, the indeterminate sentence and the probation system. It is to the same degrading conditions that our children owe the elaborate provision of reform schools, detention homes, juvenile courts, and, finally and best of all, a new body of law for the juvenile delinquent, based on the theory that he is the child of the state, to be saved, instead of a little demon, to be damned.

And, of the elaborate array of motives for punishment which I have placed before you, it appears that those only which connect themselves with the reformatory movement of the last forty years have any important or considerable field for investigation, any ascertainable and commanding facts to bring to light and consequently any future. The next few years will give us new data of great importance relating to the obduracy of the incorrigible, to the capacity of fallen manhood and womanhood to renew themselves, to the saving of children from lives of crime and shame. But there will be no facts for him who regards the criminal law as an instrument for venting hate and wrath on a fallen—and convicted—brother, none for him who would keep his fellow man in subjection to his iron law by terror, none for him who would work redemption through another's suffering. All these, coming with empty hands, shall abide as they are until the judgment. But the bringers of good tidings shall enter in and be prospered. Let no one doubt that the new spirit which has found its way into the law will soon penetrate into every fiber of its structure. The new moral atmosphere which has made every man his brother's keeper will be felt in the law courts as well as in the home and street. The new attitude of the state toward the child of tender years will soon mark her attitude toward her erring children of larger growth. There will be no more criminals to be hated and punished, but weak and fallen brothers and sisters to be cherished and saved—saved that they may live, that the state may live. It has been a long journey from the era of hatred and contempt, but the end of the Reign of Terror is in sight.

PAN AMERICAN BUILDING.
Where the congress met.

THE INTERNATIONAL PRISON CONGRESS AT WASHINGTON

As a Layman Interprets It

PAUL U. KELLOGG

They came past the Goddess of Liberty and found—cages. That, for Americans, is the very gist of the International Prison Congress which met in October in Washington and brought prison administrators, jurists and prison reformers representing forty governments to the national capital of the United States.

They came as to a promised land, and found us still in the wilderness. They came to a country which had instituted the world organization to which they were delegates; whose leaders had for two generations preached new and stirring principles in dealing with offenders; whose progressive administrators had put these principles to the test, in great reformatories, and among great groups of outlawed men. It was not then that we had not had strong leaders,nor institutions that won their enthusiasms; but that we had shattered the tablets of the newer law against the barred cells of ten thousand local jails, and the stone walls of a hundred medieval prisons; that we had bowed down to a golden calf, whose high priesthood constitutes the county political machines of forty states; that we had left the handling of the great company of minor offenders, who are on the border line between crime and citizenship, to a breed of petty judges who may have discarded the wigs of the old world bench, but whose brains are powdered with the dustier theories of a criminal law long since disproved and abandoned by the great prison men of the world.

The International Prison Congress meets quinquennially. In 1915, it will come together again in London, where forty years ago, on the initiative of an American, Dr. E. C. Wines, the first meeting was held. As a culmination to those four decades, the congress this year passed the most revolutionary piece of legislation in its history. For the first time, a majority of the delegates endorsed the indeterminate sentence. It was a great triumph, this international commitment to humanitarian causes of which Americans have been among the strongest advocates, and which had been rejected in principle as recently as the Brussels congress of 1900.

It was accompanied by outspoken appreciation on the part of the foreign delegates of much that they saw in America, in which these principles were being put into practice, notably the work of our probation systems and reformatories. Elmira, Mansfield, Pontiac, Jeffersonville are no longer merely names to European penologists. The influence of their visit here, the delegates said, would be felt in the legislatures, the prisons, the courts and the juvenile institutions of all Europe.

But the triumph was tempered by the realization that in less than half our American states is there any real reformatory work done among prisoners; and the further realization, on the part of American and foreign delegates alike, of the bitter inconsistency of our treatment of the rank and file of offenders; for, by our very methods of dealing with them, we are breeding and confirming them as criminals. When young men awaiting trial for trivial lapses from good order are herded with old-time convicts and drunken repeaters, we are sure of that result and of no other. It is inevitable wherever in our jails and workhouse blocks, two, three, four, five prisoners and sometimes more are kept in the same compartment. In the iron barred cells themselves—menageries, the Europeans called them, used as they are to the doored-cells of England and the continent—they found the physical antithesis of the reformatory ideals for which America has stood. We create with the left hand what we try to reform with the right. "A man can't live above the cage," said the head of the Irish Prison System. "The only thing to do with the Tombs," said the secretary of the Howard Association of England, "is to tear it down";—and for Tombs read practically every county jail in America. To the visitors' minds there was only one thing worse than these institutions; and that was the stupid, useless round of committing offenders to them for short terms. "Once more," said Sir Evelyn Ruggles-Brise, in bidding Americans to the London congress, "let me ask that from your great fund of heart and self-sacrifice you give consideration to the thousands of petty offenders now passing through your city and county jails in such appalling numbers."

* * * * *

The International Prison Congress may be regarded as an anticipatory branch of coming world parliaments. Twenty-two governments make up its adhering members. Several of the South American republics united with it in advance of the Washington meeting which, by a happy coincidence, was held in the new Pan-American Building given by Andrew Carnegie to the Bureau of American Republics. Spain, the Transvaal and Egypt made known their desire to join. Moreover, Professor Henderson was able to announce that negotiations had been opened which seemed to promise the adhesion of the great governments of Japan and China—the largest extension of the congress in population and area. Prominent Japanese officials have taken part, unofficially, in the congresses since that of Paris in 1900, but the delegation of Chinese jurists which came on to Washington was a new element.

The congress is essentially a diplomatic body; its delegates make official reports to their governments. Its sessions have been held successively in London, Stockholm, Rome, St. Petersburg, Paris, Brussels, Budapest and Washington. It was not until 1896 that the United States formally adhered to the congress, President Cleveland appointing the late Samuel June Barrows as American member of the International Commission. At the Budapest congress of 1905 an invitation from President Roosevelt in behalf of the United States was transmitted by Dr. Barrows, who was then elected president of the International Commission. On his death in 1909, he was succeeded by Prof. Charles R. Henderson of the University of Chicago, and Dr. Henderson's first words in opening the Washington congress were a gracious tribute to the unflagging spirit and humanitarian statesmanship of his friend and predecessor.

President Taft had welcomed the delegates to Washington, and at this opening meeting, October 2, Attorney General Wickersham spoke for the United States government, whose guests the foreign

delegates had been on their tour of American institutions in September.[1] Mr. Wickersham noted the change which has occurred in the attitude of civilized countries since before the days of the great reforms of John Howard, when 160 transgressions were punishable by death on the English circuits and when, while a man

COURT YARD OF THE PAN AMERICAN BUILDING.

of Blackstone's penetrating mind regarded such sanguinary laws as a "kind of quackery in government arguing a want of solid skill," the bench as a whole fondly believed that nothing less could "deter savage minds from outrages and mischiefs." It may be well to pause to note that this period of renaissant humanitarism is all but identical with the

[1] In the interval before the opening of the international gathering many attended the sessions of what is, in a sense the parent body, the American Prison Association, which met under the presidency of Amos W. Butler of Indiana; and also the sessions of the newly organized American Institute of Criminal Law and Criminology. These conferences were reviewed in THE SURVEY for October 22.

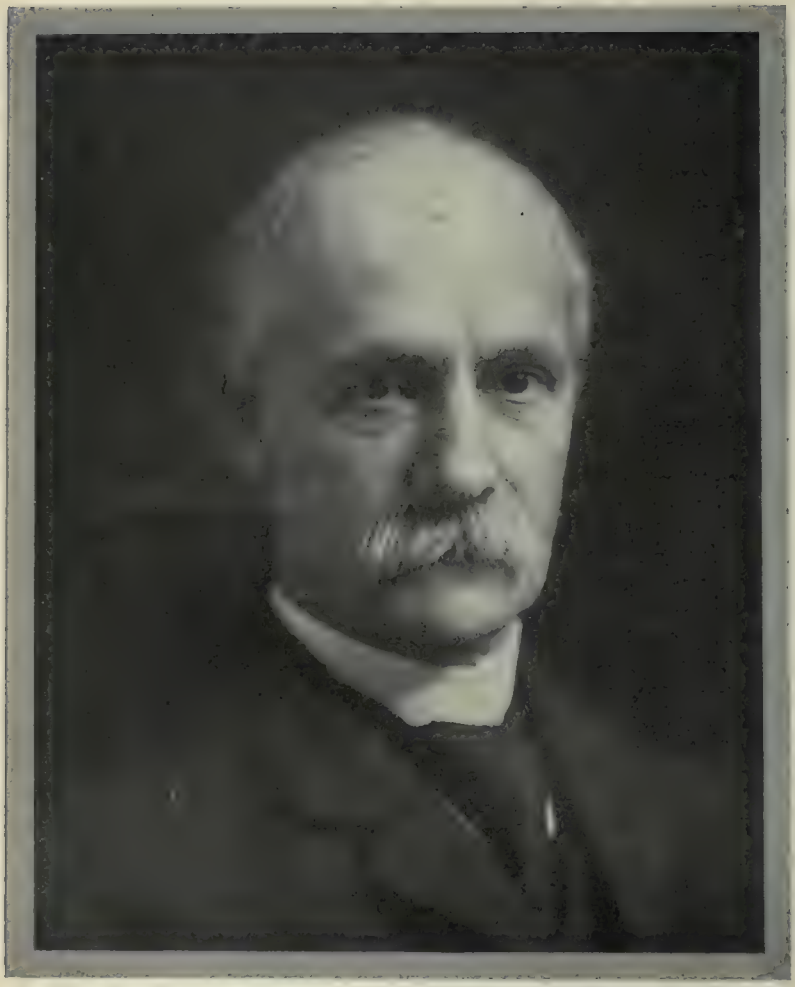
national existence of the United States. While the American Revolution shut us off from the English prison reform movement at the end of the eighteenth century—our very war for independence leaving us, oddly enough, to the tyranny of our own jails—it was natural that a new nation, conceived in liberty and dedicated to a faith in the rank and file of men, should have made original and upsetting contributions to internal as distinct from international statesmanship,—that is, to the social control of the human elements making up the democracy. As already indicated, for two generations this creative spirit has found its expression in action by a few commonwealths in establishing state reformatory institutions and systems of probation and parole. These, against unexampled opposition and inertia, have shown their soundness in theory and practice. At the same time the imprisonment of all per-

THE INTERNATIONALS.

Party of American and foreign delegates to the Washington Prison Congress, photographed in the yard of the Indiana State Reformatory at Jeffersonville.

sons awaiting trial and those under sentence for minor offenses, has been left in the hands of counties and cities. The fees to be gained by their arrest, detention, feeding and incarceration during the period of sentence, have made the sheriff's office the center of county politics and in some localities, a more lucrative post than that of president of the United States. The movements to remedy this situation have been slow to gather head; have had great obstacles to overcome; and they present today a broken line of battle which should be flung out statewide over every American common wealth.

That is, democracy has been both good and bad in its influence upon prison reform in this country. Its practical idealism has fostered a small but remarkable group of reformatory institutions in which different states have embodied the spirit of human brotherhood. But the disorganization and lack of system which accompanies local self-government has encouraged, or at least failed to wipe out, abuses which many of the centralized governments of Europe would not tolerate for a day. The democracy is therefore put to a new test by the men it imprisons; that we have not yet measured up to that test, in the eyes of the clear-seeing prison men of Europe, was the challenge which the Washington meeting cast at American will-power.



You have begun at the top, they said, can you work to the bottom? If an onlooker were to hazard an answer, it would be that in our treatment of children we are finding a new beginning, whereby the newer methods may win their way in popular favor, and with the people once back of them, work up irresistibly into the treatment of adults.

As steps in the right direction, the attorney general could report substantial progress since the last congress on the part of the national government. Laws with respect to crimes against the United States have been revised and a parole system for federal prisoners established. Of greater potential influence, however, has been the work of the recent commission on the penal system of the District of Columbia. Along with its compeers, the old district jail had become outgrown, insanitary, and out of keeping with modern conceptions of penology. Great tracts of rural land have been purchased for a reformatory and workhouse, a juvenile court has been instituted, a system of suspended sentence and probation established, etc. Thus, if plans do not go awry, the federal government itself, through its control of the national capital, may afford an example of progressive methods in treating minor and local offenders, applicable to self-governing communities everywhere throughout the United States. Thus, there was a special significance in the fact that the Prison Congress met in Washington.

* * *

The common ground of agreement, not only among Americans, but among internationals, was set forth forcibly by Professor Henderson in his opening address as president. "Science and philanthropy" he held "are one in race and one in reason." That statesmanship is false which asserts that a government has no moral obligations to its foes, no duty to endeavor to reform them to the limit of its power. These were his two main themes, and of them, he said:

> One mighty and commanding purpose has called us together and will inspire all our counsels . . . We firmly resolve to make the way of the transgressor hard, but not desperate; we desire him to tremble before the majesty of outraged law, but not to despair if he is willing to accept the reasonable yoke of honest and useful labor for the common weal . . . We look to the evangel of re-education, of reformation, of raising the moral standard of the race where the battle with temptation is hottest and victory over evil the hardest.
>
> They serve best who discern the principles of conduct which are wise and safe and wholesome for all nations. . . . They also serve, though not so well, who give sharp outlines and articulate expression to erroneous demands; for where falsehood stands out bold, naked, undisguised, it looks the hideous monster it really is. . . .
>
> It has been said that state justice has but one task, to punish its enemies; that reformation, if this is possible, should be left to philanthropists, sentimentalists, dreamers. This state of mind ignores certain facts,—that the state alone has control of the forces which influence the character of the prisoner. The state alone can direct his conduct; the state is only another name for the *organ of public duty and will;* it is not moral as a machine

Photograph by Gessler.

SAMUEL JUNE BARROWS.

Late American commissioner of the International Prison Commission, who was elected president at the Budapest congress of 1905 and through whose efforts the international body was brought to Washington this year. In Mr. Barrows's death in 1909, Americans and foreign delegates alike mourned the loss not only of a rare leader but many of them a personal friend. For fifteen years he was the chief interpreter of American theory and practice to the penologists of Europe.

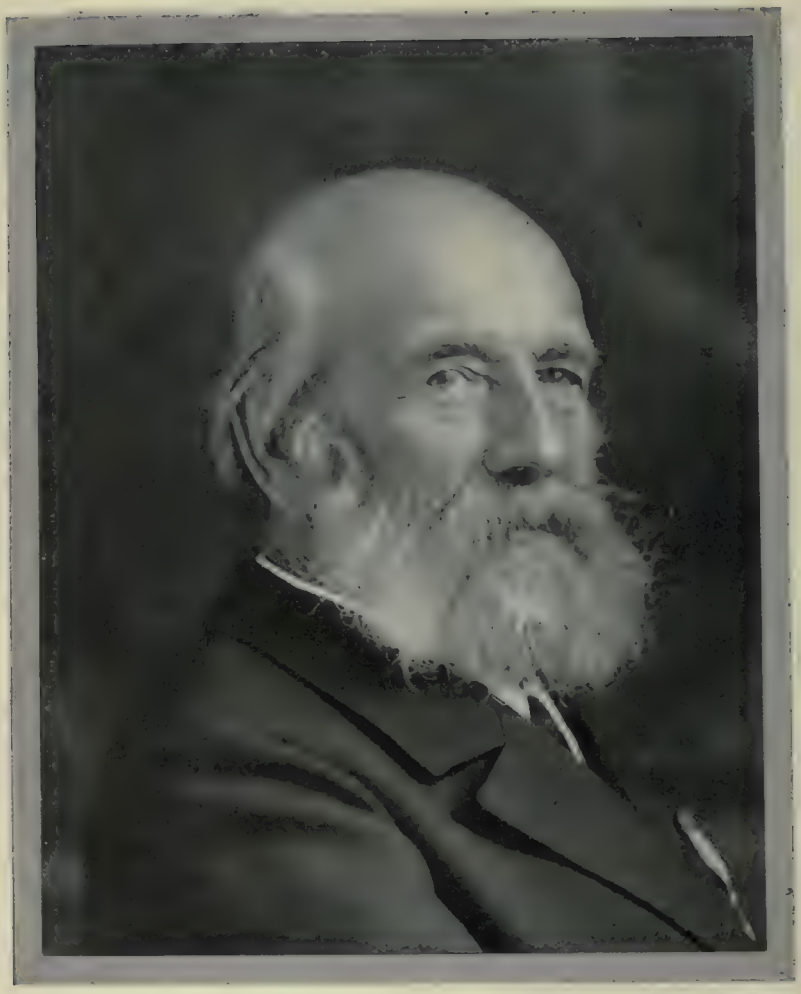
but it expresses the morality of the people who create and maintain its institutions and make its laws. The state is responsible for what happens to the prisoner while he is under entire control,—if it turns him out crippled in body, dwarfed in thought, without skill or industry, filled with revenge.

In this congress of eager, gesticulating Latins, there was something thrilling in the restraint of the American president, through the remarkable organ-tones of whose delivery ran yet a gamut of emotion and stirring appeal. "History ceases where our problems begin," he said, "Our spiritual ancestors have not only bequeathed us fortunes of truth, but also grave questions as an inheritance. We have not come to the end." In its final analysis,

the chief instrument and sanction of modern penal law is reduction to slavery. Capital punishment is rare; torture is forbidden; slow starvation is illegal. Only bondage, therefore, that is deprivation of free movement and choice of one's occupation and recreation, remains. But do we really know in a scientific sense what are the actual effects of this slavery in preventing repetition of the offense by fear? In deterring potential offenders? In building up character and fitting for freedom?

This, then, was the essence of the questions before the congress. It met to discuss how far such slavery as society holds better, relatively, than freedom abused, can be safely diminished, or can be rendered unnecessary; how far what remains may be made to effect something for the good of the individual and the public order. Those who are interested in analogies and contrasts could find them in this gathering of representatives of Europe, of "bearers of memories" of the mighty Asian empires, and of "pioneers

of modern progress" in Africa, met to discuss the technique of penal slavery in the American capital which has stood for liberty, and which went through the throes of civil war to eliminate a slavery of another form. No wonder the discussions reached to the fundamentals of government. Yet the address of the American president, as of his English successor, published on an earlier page, indicated that the ultimate and final test of penal law is not to be its conformity to either constitutions or ancient usages. It will not be the triumph of one theoretical school over another. The test, they held, must reach deeper, down into the actual human results of law and practice in accomplishing or defeating the objects for which they are devised. The treatment of the criminal, like the treatment of the sick, must be the expression of massed and classified experience as to cause and effect. How great a stride this is in the history of civilization and of law was shown by Dean Kirchwey in his analysis of the different policies of imprisonment to which men have held. He showed that neither criminal law nor judicial decisions have historically been grounded on any basis which in any field of science would be considered sound.



CHARLES RICHMOND HENDERSON.

President of the Washington congress. On Mr. Barrows's death, Dr. Henderson succeeded him as American commissioner and head of the International Commission. He gave fine dignity and spiritual earnestness to the gathering of forty nations over which he presided. As professor of sociology at the University of Chicago, student of foreign conditions and institutions familiar with the languages of Europe and active member of the American Prison Association, Dr. Henderson brought a remarkable equipment to his difficult task.

* * *

The work of the four sections of the congress is reviewed on following pages; it is only necessary, therefore, in this article to give their setting and bring out, not too connectedly, some of their most striking points. For prisons and courts and reformatories are intensely human institutions, and much that makes up the

Photograph by Campbell.

DR. GUILLAUME, SWITZERLAND.

Chief of the Bureau of Statistics of the Swiss Republic. Dr. Guillaume has acted as secretary of the International Prison Commission since the first London congress of 1872. In his eighty-third year, he made the trip to this country, a patriarch among the international leaders. As honary president of the commission he will continue his services to the causes it stands for.—A wonderful old man.

tragedy of existence lay close to the surface of even the driest of the discussions. Such stuff must not be put down in too logical an order.

As branches of a semi-official body, strong in its European traditions, the International Congress presented a marked contrast to the annual meeting of the American Prison Association, immediately preceding it. The latter, like most of our American conferences, is an organization largely for debate and discussion; and its committee on resolutions has become to a great extent a contrivance for quashing the same. Small time is wasted in splitting hairs over formulae; the sessions are given up to the exchange of experience and the discussion of principles and practice. An assembly of this sort gets close to realities, but does not bring things to a head; and continentals would perhaps get up from it, feeling that nothing had been accomplished. In contrast the International Prison Congress is a legislative assembly, or a better analogy would be to compare it to an American political convention in its work of drafting planks for its party platform. Its acts have no binding force on any of the nations adhering to the congress. One of the quaint bits of humor of the Washington meeting was the industry with which the Italian delegates whipped out little red copies of the penal code of Italy and cited it—quite ineffectually, but with the seriousness of texts from holy writ,—as reasons for barring some of the positions taken. But while the resolutions have no binding force, they have official standing as an expression of the opinion of a majority

of the delegates; and since each official delegate makes a report to his government, they influence legislation. Therefore, the sessions practically resolve themselves into debates over the wording of the common judgments of the members. To this end, the congress is divided into sections corresponding roughly to the subjects and interests represented. In the early congresses, there were three of these, covering penal legislation, prison administration, and the prevention of crime. In 1895, a fourth section was added, that on the treatment of children and minors. Its establishment was, of course, due to the increased importance placed on getting at causes of crime, rather than on treating results; and it has been in this fourth section that many of the newer ideas in penal reform have won their first recognition and amplest development.

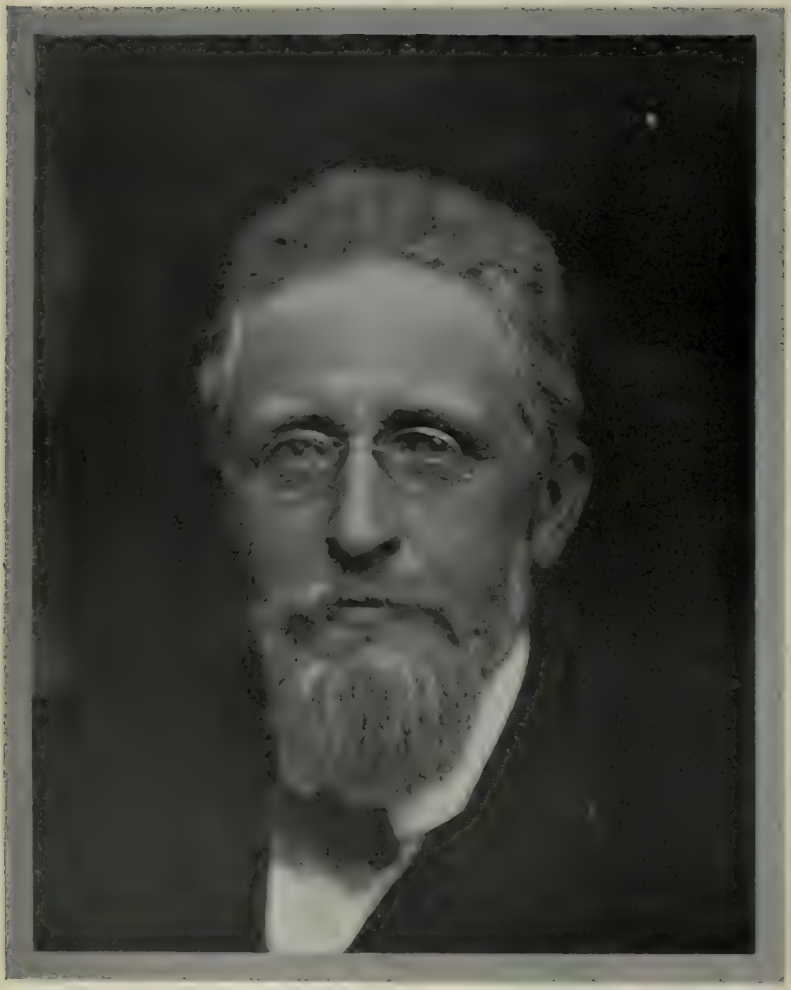
Z. R. BROCKWAY.

When the Elmira Reformatory was opened in 1876—the first of the world's great reformatories—Mr. Brockway was called to the superintendency and for more than a quarter of a century gave method and meaning to the theories in penal reform for which America has stood. Now in his eighty-fourth year, he was an active member of the Washington congress.



In his opening address, Professor Henderson gave apt characterization to the different sections, in charging them with their several obligations.

Of the first, he said:

> Those of us who, in the field of law, are merely laymen or amateurs, bow with sincere and profound respect before the genius and learning of jurists; we invoke their skill, erudition and scientific training; in the name of patriotism and humanity we request their aid in the phrasing and interpretation of statutes.

Of the second:

> But this International Congress has always esteemed the counsels of men who have experience and knowledge of the offender himself; the prison official, the expert in criminal anthropology, the physician, the teacher. It is in the prison, not in the court, that the

Editor-in-chief of the International Prison Congress; professor of international law, Geneva University. In these congresses in which two, three, and sometimes more languages are spoken, it is Dr. Borel of all men who can loosen the tangled threads of debate and bring order out of confusion.

convict reveals his real nature; it is there the hollow phrases of the law become scorpions and flames to sensitive nerves, and spiritual susceptibilities. We never really know what the penal sanction means until we apply it in its severity to human beings.

Of the third:

We also recognize in these assemblies the specialists in the study of the social conditions which produce the criminal disposition, and into which the discharged prisoner must return when the iron gate swings open to release him. Before the court and after the prison we must investigate the environment of the potential and actual offenders.

Of the fourth, and all together:

We recognize the specialists in the scientific study of tempted and perverted childhood, and of the institutions and measures for the guidance and correction of youth.

Still further, we see that each of these groups of specialists must co-operate with all the others, must compare opinions, must humbly learn, must modify traditional maxims in the light of broader experience . . . "New occasions teach new duties, time makes ancient good uncouth" . . . Courageous to defend our own conclusions, eager to learn new truths, courteous in the presence of opposition, we are at the gate of our high duty. Forward! The Eighth International Prison Congress is open.

It must not be supposed that the various sections go at their debates helter skelter. The work is highly organized during the five year intervals between the congresses. Funds are appropriated by the governments adhering. Each appoints a representative on the International Commission, which meets about every two years, and formulates the various questions which are to be discussed at the succeeding congress. These are announced at least a year in advance, and reports and monographs are invited on each question. The papers are not read

at the congress but are published as "separates" in French; and tables in the different rooms in the Pan-American Building were loaded with these thin pamphlets, with their unfamiliar red and blue tape bindings. French is the official language, and to meet the exigencies of an American meeting, where native-born polyglots would be few, the American Prison Association commissioned Mrs. Barrows to digest and translate each paper. It was a capital stroke of enterprise, the work was remarkably well done, and these little leaflets not only put the American delegates in touch with the point of view of the foreigners with whom they were to join in discussion, but gave them, more definitely than the discussions themselves, glimpses of European thought and experience on each problem.

ISABEL C. BARROWS.

On the death of Mr. Barrows in 1909, Mrs. Barrows was called to Paris to attend a meeting of International Prison Commission and lay before it the plans which her husband had initiated and advanced for the Washington meeting. For in this life work, as in all else, husband and wife were co-workers. Mrs. Barrows digested and translated into English the many papers contributed to the Washington congress; and acted as assistant editor of the *Bulletin*.

The working program was for the sections to meet separately in the mornings. Papers bearing upon the questions had been placed in the hands of sixteen special reviewers appointed in advance,—three of them American women,—who analyzed them and presented the results as the basis for discussion, each with a series of recommended resolutions. An interpreter, gifted not only in languages but with knowledge of the subjects before the congress, was present at each section, translating to and from French and English, so that if a delegate knew either tongue he could follow the course of the debate. This was true also of the general assembly which met in the afternoon, and to which each section reported whenever its members had reached a majority agreement on any resolution.

Here the text had to run a second cross-fire from delegates who had been in attendance at other sections; and a resolution was either adopted, amended or sent back for redrafting to the section from which it came.

* * *

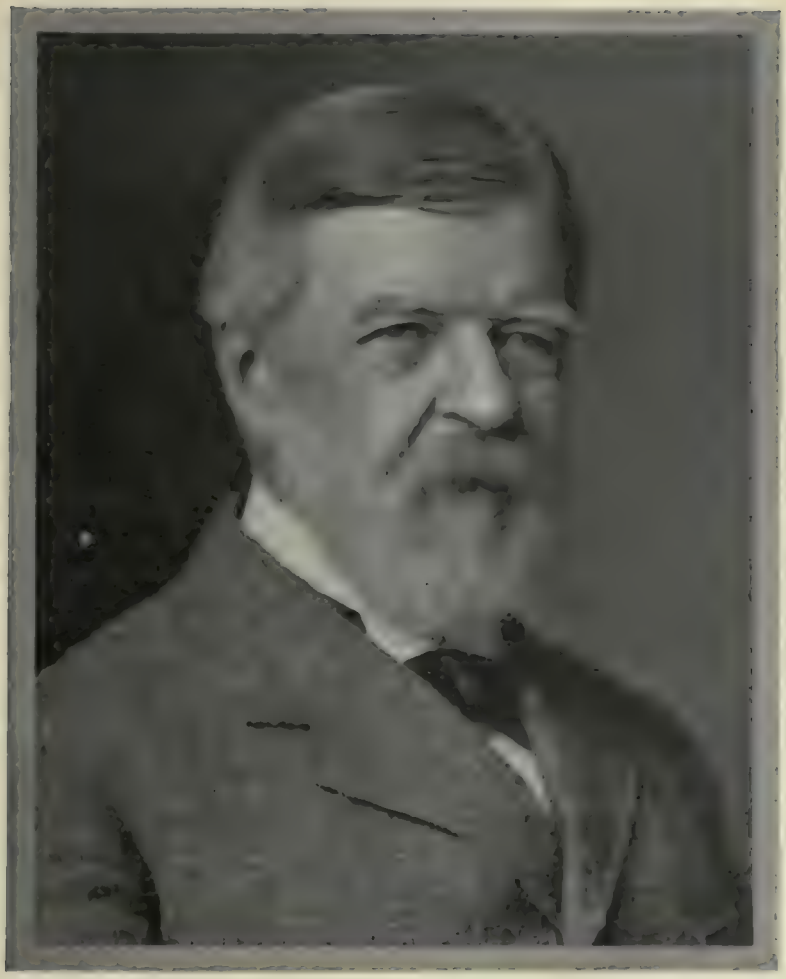
The scene of sharpest conflict was the first section on criminal law; and the bone of contention the question of the indeterminate sentence, which had failed of endorsement at the previous congresses. For three days the debate was on, a Belgian, a Hollander and an Italian successively taking the chair in an effort to bring the discussion to a head. It recalled the second Peace Congress at the Hague, when it is said, as the result of three weeks labors, the delegates added the two words "and desirable" to a resolution declaring that "arbitration is a useful thing among nations." Imagine, if you will, a long narrow table, the length of five Thanksgiving dinners, with the chairman at one side in the center, from which point of disadvantage it would be difficult to hold both ends of the most phlegmatic assembly to order. More than once during the first two days, twenty delegates were on their feet and as many interpreters would have been needed to keep abreast of the discussion. At one end of the table was a group of Chinese and Japanese, alert but silent; that they did not understand and weigh every item of the small-fire of tongues you could not have guessed from the relaxation of an eyelash. At the other end of the table was an equally quiet group of Americans, two professors, a prison reformer, two or three wardens—a little bit bewildered, looking like a group of business men at a symphony concert, but with an air that the points at controversy had long been threshed out among them, and that they were willing to wait for the others to go through what was for the older countries a harder process of readjustment. To a visitor, the long table with its knots of taciturn men at each end provoked speculation as to whether this temperamental spectrum was likely to be repeated in any future congress of the nations. In the middle ground were all grades of animation. Directly opposite the chairman was a group of six or eight Latins. They spoke with their eyebrows, their hands, their elbows; they spoke with an intensity which an Anglo-Saxon would use only when angry; they joined in a chorus of tongue-tipped "n-n-n-no's" when they differed with the interpreter in his statement of the case; they relapsed, unruffled, when the chairman, with half of their fellow-delegates following suit, rapped them to order, after a private debate with a next door neighbor. As the time went on this group drew closer together, chairs overlapped, and they presented a compact, tense, explosive battery of theory and argument, opposed to any wide departure from established principles. The conservative view most largely held—and that in itself was something of a change—was for a specified or determinate criminal sentence by the court, followed (where deemed essential as a protection against the proved incorrigible or mentally defective character of the convict) by a further (supplementary) term, dependent for its duration on the amendment of the prisoner. The view which was carried, in contrast to this, favored a sentence of indeterminate duration dependent on the prisoner's reformation, although the length of such a sentence should be indeterminate only up to a certain maximum duration, fixed at the trial, leaving to the board of parole discretion to release the prisoner in the interval. The progressive wing of American penologists have gone further than this and have stood for an absolutely indeterminate sentence, properly safeguarded. They could, of course, have outvoted the foreigners, but refrained from arguing their position beyond making it known; indeed, Professor Sherman of Yale, who analyzed the papers on question 1, held to the conservative position stated above.

Recruits to the aggressive theory of social control developed in an unexpected quarter. The burden of battle was taken up by two young delegates from oldest Europe, Gleispach of Austria and Vambéry of Hungary, who matched the Latins in gesture and animation, and outdistanced the Americans in pressing the theory of the indeterminate sentence to

what they held to be its logical conclusion. It was in German, after all, rather than in French or English, that the position was carried. More, they succeeded in adding a clause to the effect that, in the course of time and with more extended experience, the maximum and minimum limits might be dispensed with altogether, and the length of a prisoner's confinement (like that of an insane patient, or a person with contagious disease) be left to the discretion of a parole board.

Great tangles of world old controversy lay back of this rather technical discussion, this tissue of words which the delegates pulled back and forth between them. More had to be reckoned with than overcoming the inertia of traditional ways. Here was a red skein reaching back to the *lettre de cachet*, indeterminate sentences, forsooth, passed on a man at the whim of monarch or cardinal or mistress and sealing him up, without trial, till the Bastile had whitened his hair. Small wonder that a people which had wrested personal liberty as a result of centuries of uprisings, should be chary as to their hardly-won safeguards. Here were threads leading off to elemental religious teachings of sin, punishment and repentance; off to old juridical notions of vengeance and fear as the state's best buffer against the foes of its social order. Here were strands that led out to isolated powers of government, legislative, executive and judicial, jealous of encroachment the one upon the other. In the end, as against these tangled purposes, it was perhaps the spirit of democracy which triumphed, which can trust its delegated servants with powers greater than those which Old World subjects would leave in the hands of their authorities; the spirit of science, which tests all things and has found the old systems of criminal courts and prisons to be ineffectual; the spirit of invention, which in the probation officers and parole boards has devised new agencies of government, with more flexible uses; and the spirit of humanity which sees that it is criminals, not crimes, with which society must deal; men, not offenses; men surprisingly like the rest of us, who can be held and helped and re-established in life. "There is no criminal type," was the ringing message of the British delegation, fresh from Pearson's statistics of a hundred prisons.

* * *



Baldly stated, under the old system, a man is tried for a specific offense; of that a jury must find him guilty or innocent; the judge, if guilt is established, passes sentence of imprisonment; of its length he is the sole dictator, but there his powers end; the enforcement of the sentence is in the hands of the prison administration, an arm of the executive branch of the government, which cannot modify the penalty by an eye or a tooth or a day's breadth. So long as the purpose of imprisonment was punishment, the judge was perhaps in the best position to make a guess at what the man merited according to the twisted ethics of the old criminal codes. With reformation as the motive and justification for imposing sentence, the whole situation changes. Reformation of the man cannot be measured off in advance any more than education of the mind and convalescence of the body, both of which it embraces. People are not sent to a hospital for two months but until they are over the smallpox. Therefore in the most progressive American practice, and it must be remembered that this is not yet true in all states, once the jury has brought in its verdict, the judge can act with new and flexible powers. If he thinks imprisonment is unnecessary to prepare the man for right behavior thereafter, he may suspend sentence and put him on probation, that is, under the supervision of an officer of the court, until he proves that he no longer needs oversight. By so much then is a great mass of needless penal slavery done away with. But once the judge decides that forcible segregation of the offender from the community is the only way out, he sets a maximum term for the same, in accordance with limits which the Legislature has itself prescribed. But as to when, within that term, the man shall be released neither Legislature nor judge has anything to say. The decision as to release rests with the parole board, also with flexible powers, which is identified with

the prison administration rather than with the court, and which bases its decisions not on the offense committed, but on the new fitness of the man for society as evidenced by what he does with himself in prison. His term may be short and followed by supervision by parole officers, thus cutting away another great mass of legal slavery; or it may be long, as in the case of a young fellow who needs building-up by a rounded educational process; or, as in the case of the recidivist who should be permanently quarantined from free society, and whose commitment for even heavy determinate sentences for specific offenses is a ridiculous protection to those he preys upon. Ways are open, then, by which a free people may readjust that residual penal slavery which by their suffrages they declare to be better than liberty abused, and may endeavor to make it serve the ends for which so perilous an infringement upon human liberty is resorted to. "Half the people in prison should never have been sent there," said Chairman Gibbons of the Irish Prison Board. "A large proportion of the remainder ought never to be let out." Thus, we come down to the primary issues of law and liberty which underlay the Prison Congress.

* * *

But, as it turned out, it was not so much the clashing of ideas as the common ground, which the Washington meeting emphasized. In that, Professor Henderson's opening address was prophetic. The sessions cleared up the misconceptions of many Europeans, who had viewed the indeterminate sentence as wholly antagonistic to their political and juristic systems. For Americans, the debates brought sharply forward the necessity for developing the standards and methods of their probation and parole boards. As arms of government, they should not compare unfavorably with existing agencies of authority. On the other hand, foreign jurists and administrators gained a juster apprehension of the work of these boards; that they need not be arbitrary, nor sacrifice the older safeguards. Old leaders among the penologists of Europe, like Dr. Guillaume, and young men like Gleispach and Vambery, have upheld the principle of the indeterminate sentence in their writings. It now developed, more clearly than ever before, that in actual practice the thing itself, as distinct from its name, has been winning its way among European prison administrators. So soon as continental prisons adopted the "ticket of leave" plan and let a man out on good conduct, then the old idea was broken down; the judge's dictum no longer stood, come what may. Similarly, the supplementary penalties which have been developed in the Low Countries are of the nature of the indeterminate sentence. While Americans disbelieve in giving the police the supervisory powers entrusted to them in Germany and certain other countries—holding that a distinct arm of the government, part of the prison administration, should be commissioned to do this work—the idea is similar. The Borstal system for treating young offenders, established in England, Ireland and Scotland, is kindred to our reformatories; so are the institutions for juvenile delinquents in many of the countries of Europe, while one of the Scandinavian systems would seem to do away with the need of courts in dealing with children.

So it was that while the lawyers and theorists wrangled about names and theories up and down the long, narrow table, the section on prison administration passed resolutions of similar tenor dealing with the thing in practice. And they did it in half the time, thanks to the president of the American Prison Association, Mr. Butler, who in the enforced absence of the reviewer upon the question, sat up all night, and digested the contributed papers. In voting, the American delegates made it clear that in several of our states law and practice are in advance of the resolutions as adopted; they were not, they held, committing themselves to a backward step, but by putting the congress on record were to this extent assisting other countries in making the advance. The section on prevention, where the treatment of crime was brought up flush with other social problems, broke still further away from the old forms and traditions. Inebriety, labor colonies, the support of prisoners'

FREDERICK HOWARD WINES.

Of the delegates at the Washington Prison Congress, two had been present at the Cincinnati meeting in 1870 out of which grew in turn the American Prison Association and the International Prison Congress. These were Mr. Brockway and Dr. Wines. Few sons have had it in their power so to advance the causes for which their fathers have stood, as Dr. Wines. In prison reform, in the administration of public charities, in the Federal Census and in other fields of sociological and literary interest, his work has been national in scope and versatile in character. He presented a special report to the Washington congress on the death penalty, and in a very special sense, represented the American position during the debates in the section on criminal law, which resulted in the commitment of the International body to the principle of the indeterminate sentence.

families were discussed in their practical hearings. So, too, did the section on children where the administrators of institutions for young offenders were equalled in numbers by juvenile court judges and probation officers, and where physicians and educators served further to wean the discussions from any formal legal aspects. And it was natural for the common judgments of these sections to deal even more intimately with the technique of the new régime, which is perhaps best embodied today in our more progressive children's courts. Without any concert whatever, three of the sections discussed the need for physical examination of prisoners by competent medical authority. The trend is to regard the prison problems as bound up with those of health and education and economic conditions as well as with those of morals. The discussions and their participants gave evidence of the rise of a new profession. Its needs found expression in Professor Henderson's closing plea for scientific training and social outlook among practical administrators, and Professor Vambéry's public lecture on the Professional Training of Prison Officers. The latter agreed with Havelock Ellis that the average "prison officer of today is about as well fitted for the treatment of criminality as the hospital nurse of a century ago was fitted for the treatment of disease." He said:

KATHARINE BEMENT DAVIS.

Superintendent, State Reformatory for Women, Bedford, N. Y.; chairman of the section on treatment of children and minors, of the Washington congress. Dr. Davis's appointment was a recognition of the part which American women have played in prison reform. The discussion in both French and English make such a chairmanship an exacting office, and the excellence of her work as presiding officer provoked not a little comment. She was also one of the reviewers of the second section.

In India a "security bond" of from 150 to 500 rupees is exacted from any prison officer as a guarantee for the faithful performance of his duties. What I demand is a moral guarantee of his knowledge and fitness, without which it is impossible for him satisfactorily to fulfill his professional duties.

* * *

To Professor Vambéry's mind, most so-called prison systems have not been systems at all, but the products of strong personalities endowed with much knowledge of human nature and a talent for organization.

In point he cited the instance when, in the forties of the last century, Obermeyer was appointed governor of the old penitentiary at Munich. He found there from six to seven hundred chained prisoners who, although there were 120 wardens, lived in the greatest insubordination. By his energetic action, Obermeyer gained the confidence of the prisoners, took off their chains, dismissed half of the jailors, and appointed convicts as wardens of the workrooms, with the result that only about seven per cent of the convicts relapsed after discharge. Obermeyer's work and that of Colonel Montesinos in Spain, which took place at about the same time, have been considered by various writers as the beginnings of reformatory treatment.

In his public lecture on the history of prison reform in Holland, Professor van der Aa found still earlier traces. There, he stated, in the last part of the sixteenth century, imprisonment was first instituted as a form of punishment. For imprisonment was itself a great stride forward, as against capital punishment, corporal punishment, more or less painful degradation, banishment and fine, which had made up the traditional series of penalties. Burying alive and boiling in a caldron were practiced; burning or roasting were frequent when the sword or rope were thought to give too easy and speedy a death; crushing or cutting off limbs, splitting the nose, piercing the tongue, nailing a man's ear to a pillory—the list carried the congress from its new fields of experimentation back into the shadows of the dark ages, when sincere men thought they were doing righteous things in inflicting torture. The fact is one which should make thinking men pause today in claiming too much light or justification for methods in vogue, whatever dignities and sanctions we may throw about them.

The general state of affairs in the course of those centuries reveals the fruitlessness of such treatment of crime. In Amsterdam, the application of punishments in great numbers brought a reaction. In 1589, the Board of Aldermen

objected to sentencing to death a youth guilty of theft and urged the burgomasters and council to:

> find an appropriate way that such juveniles might be constrained to steady labor in order that they thereby should be brought to give up their evil habits and that an amendment of their lives might be expected.

To this end one of the old spacious cloisters which had been evacuated since the Reformation was opened for use in 1596. Here was a "new institution and a new penalty," which "doing away with the principle of destruction maintained the principle of deterrence, for the labor was hard and the discipline severe, but added another principle, that of amendment." The duration of incarceration was not fixed beforehand, and here, curiously enough, Professor van der Aa pointed out, we find a first trace of that burning issue of the present congress,—the indeterminate sentence. Labor constituted the chief element of treatment; the men were put to rasping dye-wood and weaving various stuffs. More, pecuniary rewards were allowed the prisoners for the work done. Thus, another of the vital questions engaging American prison reformers today—that of payment to prisoners, especially the men who have been bread-winners—was raised by this early Dutch experience before even the founding of a new Netherlands. It was from the "Rasphouses" and "Spinhouses" in the Lowlands and the Hanse towns, which grew up from these beginnings in Amsterdam, that John Howard drew many of the constructive principles for which his writings won a hearing in Europe, and later in America.

* * *

The beginnings of prison reform in this country were recalled at the joint meetings in which the National Prison Association and the International Congress participated. President Butler brought out that since the establishment of the Elmira Reformatory by New York in 1877, twenty-one states have adopted some phase of the indeterminate sentence, and none has taken a backward step; fourteen reformatories for adult male offenders have been established. This record presents a contrast to the arraignment by Signor Scalia, who in 1870 at Cincinnati reviewed fifteen congresses held in Europe between 1835 and 1869 in which crime had been considered. But what has actually been done, he asked, to control its predisposing causes? answering his own query in the negative.

The Washington congress was made an occasion for the publication of four souvenir volumes on Correction and Prevention, edited by Professor Henderson as chairman of a sub-committee of the American Prison Association. They were written by the leaders of prison re-

AMOS W. BUTLER.

President of the Washington meeting of the American Prison Association. His address linked the treatment of convicts to the conservation movement.

form in this country and published by the Russell Sage Foundation. They set forth at length theory and experience as they have developed in the United States, and are invaluable to any American who, in his own state, would trace the issues raised by the Washington congress, and see how far his commonwealth is abreast of the standards of national and international advance. It is unnecessary, therefore, to quote at length from the addresses at Washington of the American leaders. There were few actual prison managers among the foreign delegates, who were mostly jurists, professors and central administrators. The American wardens at Washington were a representative group of men, and in vigor and intelligence they left their impress upon the Europeans. Major R. W. McClaughry of the Federal Prison at Leavenworth, dean of the American wardens in active service, gave a statement of the elements entering into the treatment of the criminal, which, if compared with the three factors named by the British prison commissioner, shows the shifting of emphasis characteristic of New World experience. "We have learned that prisons should be considered the last resort," said he, " and that while there abide, and probably ever must abide, penalty, reformation, prevention, the greatest of these is prevention."

There was profound attention when the venerable ex-warden of Elmira gave his "impressions of the prison reform movement after half a century of active participation succeeded by a decade of reminiscent dissociated consideration." A considerable portion of what Mr. Brockway said was devoted to showing that during the century or so of the penitentiary system, there has been more progress in ideas than in practice as to both criminal jurisprudence and penitentiary administration, and that the advancement actually made in both respects is not known among the people generally. On these points he said:

> The actual difference between the old and the newer penitentiary theory and practice is not yet common enough, nor positive enough to make a profound impression. . . . Even in the best of our modern reformatory penitentiaries, where enough of wisdom exists to know what should be done; enough of skill, potential or slumbering, exists properly to execute it; the virtue of doing it and doing it now is apparently absent or deficient.
>
> The demand of the hour—that to which prison managers should devote themselves—is a more thorough and scientific reformatory administration of the prisons, for when that is achieved, public confidence will be gained and the true foundation will be laid; namely, the absolute indeterminate in place of the present bastardly indeterminate sentence.
>
> It is, perhaps, well that, pending perfecting of prison administration, some limitations of sentences, harmful though these are, should remain. Whenever the laws and reformatory penitentiaries shall be so administered that prisoners are only committed because they are dangerous if left at large; once committed shall never, barring unavoidable accidents, again appear as criminals at large; and always be conditionally or absolutely discharged when they are really safe,—then, and not until then, will the penitentiary system prove really repressive of crimes and be worth its monetary cost and the painstaking effort involved.

Mr. Brockway and Dr. Guillaume were the patriarchs of the congress. Both were young in hope. To Mr. Brockway's mind, the principles and conditions which must ultimately prevail, are:

> a reduced ratio to the general population of prisoners in custody and a reduced average quality of those imprisoned, to be effected by invention and activity of preventive measures, particularly the technical and civic training of public school pupils; a new preventive police function; extension of the probation plan; and care of discharged prisoners. The court practice will be confined to the discharge, probation, or committal of offenders, leaving their classification and treatment to another properly constituted authority. Incorrigible convicts may be employed for profit to the state but not those undergoing the scientific reformatory treatment. For these trade training, regardless of profit, is advised and it is healthy for the public sentiment about crimes that the cost of it all shall be borne by the public and preferably by each civic division according to its record of crimes. The reformatory of the future will be a "moral orthopedic institute" where deformed and wayward feet are straightened out and put in proper paths; and it will be a laboratory for study of socially dangerous human defectiveness,—a research station for discovering the anti-social bacilli and at the same time for searching for nature's counteracting serum.

Mr. Brockway's address was thus distinctly a statement of the scientific ap-

proach to reformatory work. To him it is essentially "a human work not shiftable upon the superhuman or the subconscious mind." "The reformatory prison science reaches to biology and the constructive foundations of society"; "the translation of the moral terms which the race has worked for, into unconscious habits of action," is, to quote President Hyde, "the crowning step in the conquest of character." Mr. Brockway was followed by Frederick Howard Wines, another of the half dozen Americans still living who were present at the Cincinnati congress. While not deprecating the scientific spirit, Mr. Wines voiced the deeply religious convictions which had led his illustrious father and some of his colleagues to undertake their optimistic movements in behalf of the criminal. There was something fine in this good tempered but assertive clash, as to the underlying motives which had led these two men to engage each a lifetime in this common work for humanity. Dr. Wines has had forty years of active labor and every one of them, he maintained, has deepened his conviction

that it is vain to cleanse the outside of the cup and platter unless we reach the heart, the conscience and the soul of those for whom we are working. Reformation may not begin at the center. It may be necessary to work upon the body before you reach the mind. It may be necessary to inform the mind before you reach the soul, but reformation is never accomplished until the heart has been touched and regenerated by the grace of Almighty God. . . . Human nature is not a single thing. We are not mere animals but living spirits and have within us a spark which emanates from the Deity. Science cannot formulate the laws of this double human life. We take of the scientific care of the unfortunate and criminal which is well enough, if we refer only to that with which science has to do, but science will never touch the soul of man. Nothing but religion can do that. . . . The redemption of man can only be effected through the power of love. . . . Love and law must be married to each other. Love without law is degradation, but law without love is brutalizing. I offer one sentiment for your acceptance and adoption. I pray that it may influence your thinking and your action, after all of us have passed away who are here to-night. It is the wish for a sacramental union between love and law, in this country and throughout all the world, which may enable us to say of them—"Whom God hath joined together, let no man put asunder."

* * *

So, by one of the strange juxtapositions of life, it was old men of the New World and young men of the Old, who spoke on the same themes at the Washington congress. It has taken a generation and more, but the Americans have won. But it was no part of the preachment of these pioneer leaders that we have reached a point in this country where we can rest on our laurels. They have ever been fighters and will stay so to the end. Mr. Brockway likened the present situation to the darkness before the dawn.

It remains, therefore, in keeping with this spirit to set forth succinctly a few of the constructive criticisms made by the foreign delegates of American institutions and methods—not in their addresses, but under prompting in personal conversations. Dr. van der Aa's impressions are set forth on another page, and here I shall limit my quotations to a few matters, such as the county jails, the cells, the size of prisons, prison labor and the death penalty.

To quote Thomas Holmes, secretary of the Howard Association of London:

The great conviction which thrust itself upon the mind of every one of the foreign delegates with whom I have spoken was the extraordinary quality of your reformatories and the extraordinary defects of your town and county gaols. Every jail I saw ought to be wiped off the face of the earth. So far as I can learn, having spoken to the delegates representative of the continent, nowhere in Europe do such conditions exist. I need not describe them. They are all alike. In the jail at Louisville we found a number of prisoners in back to back cells, lighted very poorly. The cell doors were open. The prisoners came out and walked about in barred enclosures inside a big cage. They were in some darkness, a little light coming from the windows outside. One man who had been there nine months told me that they were kept there in idleness, no recreation, no outer air. My inquiries led me to believe that there were other jails of about the same structure, and that this course of procedure was quite common. If America wishes to accomplish one great humanitarian triumph, it may do so by a great reform in this direction.

The nature of this criticism lies deeper than either jail structure or administration. It lies in the system. In Great Britain when a man is arrested he can

be kept in a local lock-up only a short period; then he is drafted to the nearest prison, and treated as a trial prisoner under detention. He does not associate with convicted men; nor are convicts made to serve their sentences in the local jails. Said J. S. Gibbons, chairman of the Prison Board of Ireland:

> I tell you what I think you lose sight of in this country—that all these splendid reformatories deal with merely a drop in the ocean compared with the county and city jails to which your thousands of prisoners go and where many are manufactured. We were exactly in the same condition up to 1877 when we brought county and city jails out from under local authorities in the United Kingdom. We found the antecedent to all reform was state centralization. In 1877 every prison and jail was put under central administrative authority and the expenses paid out of the imperial funds. Three acts were passed simultaneously for the three kingdoms. We then began at the bottom, closing all the superfluous ones, and in that way we were able to close about half. I have to give every person, whether tried or untried and especially the untried, a separate room to sleep in, and I would lose my job if I put two prisoners in a cell. We are obliged by law to keep tried and untried separate. They never see each other. I am obliged by law to give every prisoner two hours' exercise in the open air every day. And I am obliged by law to make every convicted prisoner work even if he is sentenced only for two days, and to offer every untried prisoner work. A man might be in the Tombs for months and never get out doors. I am full of admiration for what the New York prison authorities have done for improving the Tombs, putting in windows and tinkering here and there. But they ought to pull the thing down. In these days of rapid communication there is no need of prisons in the center of a city. They may be moved out to the suburbs. And once a man is regularly committed by a magistrate, the local officials ought to turn him over to the prison authorities.

The same reforms were urged from the point of view of prison construction by Major H. S. Rogers, chief surveyor of the English Prison System. In the first place, he advocates smaller blocks of cells, not over thirty cell spaces in size and not over three tiers high. Some he saw in this country were five high, the galleries shutting off the air, and making oversight difficult. But it was the general system of barred interior cells prevalent not only in the county jails but in prisons and reformatories, that he criticised most rigorously. In the first place he believes concrete is better than iron to build cells with. He said:

> Inside cells are something which I never saw before coming to this country. Cells in England and continental Europe are built in from the outer wall. Here many are built in the center with iron bars in front of them. In most prisons the cells have no access to the outer air.
>
> Our plan makes it easier to supervise because you have one corridor down between two rows of cells, instead of aisles all around the sides. You can spot the man who makes a row.
>
> We have a door and not a cage and never more than one man in a cell. I saw seven or eight women in a cell at Blackwell's Island. Repeatedly we saw two men in a cell and the cells, at that, are exceedingly small. I would rather put three men in than two. One of them may be an old offender, a dirty beast. What is the result?

The prison at Michigan City was spoken of favorably by one of the foreign delegates, but the cells in most of the old fashioned prisons throughout the country were declared to be sufficient in neither light nor air. This was said to be equally true of some of the newly constructed buildings. New York state is today planning to build its new great state's prison involving an expense of millions on this utterly wrong principle.

The cells at the Elmira Reformatory were found altogether unfit by Mr. Holmes. He said of them:

> You elevate men as you do there in mind and principle and then submit them to cells with no covering for the sanitary conveniences and with iron lattice doors through which every one of their movements may be seen. That seems to me demoralizing. Having done so much, you might to great advantage abolish the cells, take away the ever present sense of being caged, and give more refined conditions for the solitary time of the men. The cages tend more to make men try to escape than either small bedrooms or even dormitories. You people don't like the name of prison. You like euphemism. But your reformatories are prisons to all intents and purposes so long as you keep the men in cells and cages. It is borne in upon them. The same remark applies to a good many other reformatories beside Elmira. Every condition seems to me good except the prevalence and multiplication of bars.

Another point of criticism of the state congregate institutions was the tendency here in America to build very large pris-

ons running up to a thousand, 1,200 and 1,400 cells. The progressive tendency in prison administration is toward classification of inmates. Large cell buildings save initial cost, but make it difficult to separate the classes effectively. More than that, however constructed, a big prison under one head was held to be objectionable. Major Rogers put the maximum at 500 or 600 persons for a local prison; 700 or 800 for a convict prison where men work in large parties.

* * *

This point was developed from the angle of reformatory administration by Dr. Vanbéry of Hungary. To quote:

> My conviction is that reformatories should give the utmost possible individual treatment. That was the idea that Wines, Sanborn, and others had at the congress at '70. But individualization is not possible with a prison population of six or seven hundred prisoners. We have been in three reformatories, Elmira, Monteith and Jeffersonville. I asked if the men were divided into groups and what was the principle of the division. They said they were not divided. For example, they are together at meal time and recreation. Criminals in reformatories are very different in character, not bad to the same degree.
>
> Further, the result of reformatory treatment depends on parole. The board of parole itself cannot form judgments by its own experience, it must rely on the opinion given by the superintendent. It is impossible for one superintendent, however wise and careful he may be, to judge the character of 700 prisoners.
>
> My suggestion would be to form smaller groups as in the industrial school near Rochester. Industry, which is the most remarkable institution I ever saw in my life. There is nothing to compare with it in Europe. These boys live in small families. Every family has two supervisors, a man and a woman. The life which these families live is real family life. For the money spent on the magnificent Monteith Reformatory two smaller institutions could have been laid out along these more effective lines.

* * *

Dr. Vambéry is an ardent advocate of the indeterminate sentence. He is in accord with the spirit of reformatory treatment. But like Sir Evelyn Ruggles-Brise, he calls for a scientific demonstration of the output of the American institutions, for statistics not only to convince the world as to the soundness of the theory back of them, but to test and prove the various factors entering into the treatment of the men. On this point he said:

> In Europe the general opinion is that reformatory treatment in the United States has had most remarkable results. I am sorry to say it was impossible for us to judge these results. You have no statistics whatever.

Similarly, Mr. Holmes made a plea for a clear definition of the powers of parole and probation officers, and for their supervision by responsible boards or commissions. To quote him:

> On returning to England I will advocate the appointment of paid probation officers, the training of such officers before their appointment, and a board to appoint them; certainly not leave their appointment to a judge who appoints all his own officers. The position should be dignified and fairly remunerative; the same should be true of that of parole officers.
>
> I want to give one note of warning. I shall advocate these things and have advocated them in England, but I see their dangers. In all reforms you must beware of two things. You must not coddle and patronize prisoners and you must be careful not to give probation and parole officers such powers as may be prejudicial to the rightful members of the communities. You have the police with their powers and probation and parole officers with theirs, and there is great danger that unless duties are absolutely defined and powers described they may trench very largely on the rights of the home. We must be free or die.
>
> I shall urge a reformatory for adults and the indeterminate sentence with safeguards.

* * *

An issue raised at the Washington congress which ranks in importance with that of our county jail disorders, was the question of prison labor. This was approached from several sides. The second section passed resolutions upon it from the standpoint of prison administration. The matter was brought forward in its broader and more controversial aspects by a proposal, submitted by the National Committee on Prison Labor (American) to the International Commission calling for a comprehensive investigation of the whole subject. This report, drafted by J. Lebovitz of Washington, pointed out that our prison population averages 100,000 able-bodied men and women—a working force which few industrial cities can boast. On the one hand, the eight- or ten-hour day which

the prisoner spends in some occupation or none, must be the chief instrument of his reformation or retrogression; on the other hand, the manipulation of so tremendous a working force "must automatically produce the most profound and far-reaching reactions." On the one hand, the criminal is the costliest unit in society. Schoolhouses, playgrounds, and "a thousand wants of vital interest," to quote Professor Henderson, "are not satisfied because the financial resources of the state are exhausted in the conflict with crime." On the other, the chief burden of imprisonment falls not upon the guilty criminal, whom the state secures against hunger and cold, but upon the prisoner's wife and children "for whom no state as yet makes adequate provision, nor is the prisoner himself allowed any opportunity to provide for them." On the one hand, commercial prison work is such, with its free housing, freedom from taxes, and cheap labor, that when a given industry must compete with it, "complete demoralization seems to be inevitable" for outside manufacturers and free labor; on the other hand, the discharged convict is usually turned loose without any earnings as the result of his years of work and, save a few of the reformatory institutions, without training in a trade which would make him self-supporting. On the one hand, men in some prisons are speeded up; on the other hand, in most county jails they loaf in utter idleness. The situation is more than a series of contrasts. It is raw with gaping mal-adjustments; such as the peonage of some southern states and the atrocities in the prison mines of the Southwest exposed by Kate Barnard of Oklahoma;—such as the survival of the contract system in some states in the North, open as it is to all forms of exploitation, graft and the subversion of prison discipline to a combination of politics and business;—such as the "dumping" of goods made in the prisons of other states into New York, where under the state-use system goods from the New York prisons cannot be sold in the open market, but where there is no protection against importations from prisons in Rhode Island, Maryland, and elsewhere;—such as the fact that the New York fiscal agent who handles hundreds of thousands of dollars' worth of goods, engages in outside business to supplement a salary too small for him to think he can give his full time to the state;—such as the fact that among the leading prison industries, shirt and overall-making bring the convict (in prison or after prison) into competition with women workers, broom making into competition with the blind, while binder twine and hollow ware are entirely monopolized by the prisons, and the most proficient ex-convict cannot find employment in such work after his release. "Jeffersonville!—that is a factory," said Dr. Vambéry:

> I saw, for example, 120 men in one trade shop, sewing by machinery. That is not industrial training; not craft teaching. One man should be taught all parts of a piece of work, to make it educational. In Hungary in our reformatories, we teach carpentry, carriage building, leather and textile work. We have no opposition from trade unions. Of course, Hungary is not as yet as developed industrially as the United States. We are building up our industries. We formerly had opposition from the trade unions, but not now, because we asked them to place these men and they are proud of the work thus entrusted to them.

Mr. Gibbons thought some of our industries excellent, though it is wrong to keep a man at a single occupation:

> If prison officials would have a frank understanding with unions to handle their goods so as not to inflict injuries upon a trade outside, then they ought to be able to get co-operation. A great help to me was the late Michael Davitt, the Irish revolutionary leader. He was strong with the labor unions; yet he had served no small part of his life in prison, and knew what it means to be idle there. He always came to the rescue when prison work was being attacked and held that men had a right to work in prison. When prison authorities start with the idea that the first object is education and reformation and the second is financial profit, they can work out the situation.
>
> We are, of course, an agricultural people. The prisoners go back to the villages in the country districts. Tailoring and shoe-making are then our chief industries. We sell the goods in the open market. If any trade union says we are hurting its work in any line, I change my industries.
>
> But we teach the trade of the tailor, or weaving and carpentering, not how to run a button machine.

Mr. Holmes had more outspoken criticism. He said:

> At Jeffersonville and Mansfield I was struck with the Ingels developed work and subdivision of work in the industrial departments of the reformatories. In the former the prisoners make cotton ware in one department. They are worked very hard and considerable skill is required. They told me this department was subjected to considerable attention, for the pay men in it get a considerable profit for the contractor and the institution and earn a considerable sum for themselves, while others earn little or nothing. This seemed an injustice. I found on enquiry, however, that although the men might learn to make one piece with which they were familiar, there was no outside chance outside the prison walls of ever again obtaining work of that character. That again seemed wrong.
>
> I found at some of your institutions looms for weaving and twine spinning at which the men were simply automatons only. I very much doubt whether subjecting men many hours a day to that kind of work is of any benefit. A man could tramp miles from state to state, before he could utilize what he learned in such a shop. An industry in prison, whether or not it pays the state, should be such that the prisoners can follow it after their release. This is as true of state work as of contract work. Our English prisons do not satisfy me in these respects, and I am not going to quote them against yours. Physical well-being, industrial skill, proficiency in some useful work and a well trained man—such should be the goal.

Here, after all, is the crux of the situation. No system of prison idleness has any elements of reformation in it. It scotches and rots the human beings to which it is subjected. So hateful is prison idleness, and (with the decay of the old handicrafts) so difficult is the development of schemes of industrial training serviceable to adult men, that prison administrators and reformers have tolerated various makeshift or hybrid schemes of labor as better than none. These at least could be amended. In so far as they lack educational values they reflect and are a criticism of the routine factory operations of a modern industrial nation. But the situation is one which demands opening up to the bottom. To continue things as they are is to leave prison administrators and such business interests as are involved under an intolerable cloud; it is to leave the way open for abuses which add a deadening and exhausting industrial slavery to legal slavery. Yet, so far as the National Committee on Prison Labor has been able to learn, "no adequate studies have yet been made, nor are any being made today, of even one of the many serious consequences" attendant upon the situation.

The distinction was made earlier in this article between the European congress, which passes resolutions, and the American conference, which buries them. The advantages of the latter were pointed out, and it is possible that the London Prison Congress of 1915 may be modified along American lines. Here a disadvantage of the native system appears. For example, it remained for outside bodies to take up aggressively the subject of industrial accidents, while the National Conference of Charities and Correction mulled over methods of caring for the resulting dependence, without coming to any head on the fighting issues involved. In much the same way the question of prison labor has been shelved by the American Prison Association. It has remained for the National Committee on Prison Labor[1] to make it a live issue. Mr. Lebovitz's proposal to the International Congress was a well-balanced syllabus for a series of comprehensive investigations opening up all phases of the matter. Such a fearless, impartial inquiry is needed, and after it, action that will make the findings good.

* * *

The nature and legal status of the prison industries of the different states were reviewed by Amos W. Butler in his address at Washington as president of the American Prison Association. In private life, Mr. Butler is a naturalist; in public life he is secretary of the Indiana State Board of Charities, which has supervision of the various penal and charitable institutions of the state. Therefore, he was singularly equipped to take up the problem of prison labor in a way to relate it to the most idealist—

[1] This committee of which the Rev. Thomas R. Slicer is chairman was brought about by Helen Varick Boswell, chairman of the Industrial committee of the General Federation of Women's Clubs, who was brought in touch with the problem in connection with certain women's trades, and E. Stagg Whitin of the New York Department of Labor, who was confronted with it in the course of investigations made under Commissioner Williams.

national issue before the American people today. His theme was Convicts and Conservation.[1] In conclusion, he said:

The proper conservation of our natural resources and the proper employment of convicts are two great problems that must be solved by our people and they should be solved right. . . . Why cannot these two problems be related? No present plan of employing convict labor is wholly satisfactory. Some methods used bring shame to our land, others breed scandal, most of them are a reproach to us. . .

We are coming to learn that the improvement of our natural resources [as well as to save them from wastage], is conservation. This includes reclaiming and improving land, draining swamps, damming streams, digging canals and preparing road material of stone, brick and tile. Establishing and maintaining ideal farms, typical wood lots and model forest reserves are valuable efforts in conservation. In the thinly settled portions and the mountain districts of much of the United States there is an unlimited amount of such work that can be done by selected convicts living in open colonies. Do we in a faint way estimate the possibilities of the employment of certain prisoners in many lines of conservation of the water, the land and the forests? How great the results may be, in improving our land, increasing our crops, preserving or replacing our forests, or our benefits by good roads, we cannot comprehend. In some states sentiment would not approve the public exhibition of convicts, but in those they could be employed upon large farms, reclaiming the land, making road material and establishing typical forest reserves, model farms and standard roads in their neighborhood.

In this we should not have to work in the dark. In one state or another, practical experience has been gained. . . . There is scarcely a prison in this country that has not reclaimed or improved land, and some of it has been made a marvel of richness and beauty. At Michigan City, Indiana, the prisoners reclaimed a tract of swamp among the sand dunes. The black prairies at St. Cloud and the fertile, irrigated fields at Salt Lake City speak just as eloquently of the use of prison labor out of doors as do the gardens of the women at Sherborn and Bedford, or the farms at Hoboken and Mansfield. The orchards at Leavenworth testify as truly of the efficiency of open-air work as do the cotton fields of Mississippi or the cane fields of Louisiana. . . .

Why, since prisoners make again habitable the abandoned farms of Massachusetts and remove the bowlders from the rich soil of Rhode Island, can they not reclaim the tide flats of New Jersey and the everglades of Florida? Think of the reclaimable land along the coasts of the United States! If prisoners build dikes in Europe and levees in Louisiana, why not elsewhere? If convicts in Illinois crush rock for public roads, why not in other states? Why should not the finer material, the powdered limestone, be used to fertilize impoverished soils? In Europe the courses of streams have been changed, mountains tunneled and canals built by prisoners. Why not adopt Mr. Pettigrove's suggestion and build the Cape Cod canal with prison labor? Since prisoners have been used in reforesting the heaths of Denmark and in practical forestry in Prussia and Switzerland, may they not be so used here? Here where there is need of forestry, there is opportunity for such work. In the great mountain districts, the lands of disapppearing timber and along our sandy shores there are possibilities almost without limit.

In many states, perhaps most of them, some one or more of these things could be worked out. With selected prisoners under the right kind of supervision, what could not be done? The suggestions provide for the very least competition with free labor, for doing something good for the state at the state's expense. Such outdoor labor is the kind most helpful to prisoners, is of value to the state, and seeks to provide a continual exhibit of better things in the object lesson afforded in forestry,[1] agriculture, improved roads and more healthful regions.

* * *

There remains but one point which can be covered—the punishments which still cling to our system of dealing with offenders. While the congress was in session at Washington, a cripple was flogged at the whipping post of a Delaware county jail! A dark cell or dungeon would not be tolerated in England, according to Major Rogers.[2] Some of those seen in this country were almost completely dark.[2] Said Mr. Holmes:

At Auburn we were taken to the death chamber and an officer explained the operations of the electric appliances. On returning, we went along a passage and a few yards back from a wooden structure there was an iron barred enclosure, which we were told

[1] Mr. Butler's paper may be obtained by addressing Joseph P. Byers, general secretary American Prison Association, 13 Central avenue, Newark, N. J.

[1] 20,000,000 forest trees have been planted since 1900 by the prisoners of New Zealand. They are timbering the waste lands and reclaiming the men.

[2] Among the pamphlets circulated in Washington was one entitled American Bastiles by Clarissa Olds Keeler, published by the Carnahans Press, Washington. This was a budget of excerpts from the reports of state investigation commissions, magazine articles and fugitive newspaper reports as to the use of dark cells, "bucking machines," the "water cure," and other brutal forms of punishment alleged as practiced in various prisons, convict mines, etc. The pamphlet opens with an apt reference to John Howard's experience in Paris in the days before the French Revolution, when he was refused admission to the Bastile. He secured, however, a pamphlet written by an inmate depicting its horrors. This author states that the great key to the door of the Bastile, from which Howard was turned away, is now one of the relics in the Washington Museum at Mt. Vernon, presented by Lafayette. It should have been exhibited at the international meetings

closed off the condemned cells. Gripping the bars and looking straight at us was a condemned man, and we were informed that there were others also awaiting execution. If such was the case, it was a deplorable thing that men doomed to die should be incarcerated in such a manner; that they should be gazed at, should look out from a cage like a gorilla.

Not merely the manner of doing it, but the survival of the thing itself in New York and several other American states, as well as in his own country, was the subject of criticism of another delegate. It was a Russian, Count Sollohub, who first suggested to the late Dr. Wines that America should call an international prison congress which no European country, owing to political complications, could do. At the Washington congress, Russia was represented in two ways—the government, by M. de Khrouleff, chief of the administration of prisons, who fell among thorns when his statements as to Russian prison conditions were picked to pieces by George Kennan, the Friends of Russian Freedom, and others. It developed that not only by its architecture, but by its humanity and the fair play of its trials, is a nation's treatment of its prisoners to be judged. While the congress was in session, were not the czar's men transporting white-haired *Babushka* to a remote Siberian settlement? To Americans, she is one of the heroic women of the century. Then there was A. S. Goldenweiser, a lawyer of Kieff. He had no governmental, no official standing. He came, breathing the spirit of Leo Tolstoi and of his world-ringing letter, "I cannot keep still." In that letter Tolstoi could no longer keep still at the scores of executions going forward in Russia. He could not keep still when everyone of those executions convicted him, Tolstoi, and with him the whole Russian nation, of permitting conditions which brought crime into being. He could not keep still when men were being killed to protect him, Tolstoi, and with him all his fellow countrymen, because they had been too stupid and brutal to work out a better way of protection. He could not keep still when the methods to suppress crime reacted and scourged his people with a moral sickness worse than the offenses themselves. To Tolstoi, "crime is a punishment and punishment, a crime." That is the title of the essay Mr. Goldenweiser has written bringing out the message of what he considers Russia's great contribution to penology—Tolstoi's Resurrection. To his mind, this is a contribution more powerful than new systems or reformatories. To his mind, in teaching humanity to love the man in stripes Tolstoi will have as much influence in abating penal slavery, as Harriet Beecher Stowe had in doing away with Negro slavery. Of his visit to New Yorks death chamber, Mr. Goldenweiser said:

> The overwhelming impression gathered at Auburn was centered around the fateful electric chair and the wondering eyes of the two condemned criminals whose faces have haunted me ever since. There are a thousand sufficient reasons for the abolition of capital punishment, and Americans must know them all, and yet they persist in this cruel practice. Why is it that generous Americans are still working under the dreadful aberration that there are circumstances that justify one man in saying to another: "Go and kill this criminal?"
>
> We visited the George Junior Republic on the previous day and found there in this novel and remarkable colony a reproduction of the greater world with its industries, its laws, its social relations, and even with its chains and bars and prisoners. Should this institution grow in size and vigor, as we hope it might, and should its citizens wish to make the similarity with the outside world complete and demand an electric chair for their own offenders, could their request be granted? And does not this thought in itself emphasize the anomaly and the inhumanity of the death penalty as an institution in a civilized community?

This man's practical philosophy reached deep. He is not merely a dreamer but a man of experience and affairs, the sort whose constructive interest Tolstoi sought to enlist by his destructive criticisms of existing institutions. What he said demanded a re-reading of The Resurrection—not as a critique of the Russian autocracy, but as a mirror held up by the great poet-analyst of the North, to all civilized peoples that in it they might see revealed before them the "unreasonableness" and "immorality" of sitting in judgment and inflicting punish-

[1] Copies of this pamphlet may be obtained, so long as the private edition lasts, from E. S. Goldenweiser, 400 Seward Square, S. E., Washington, D. C.

ment upon their fellows. Tolstoi's negative attitude toward the criminal trial is often met by the query, "What shall be put in the place of it?" To this Mr. Goldenweiser answers:

> From Tolstoi's viewpoint this reply merits no consideration. If some one discovered that quinine, for instance, not only did not counteract a specific disease of the organism, but made it worse, could there be found a man who would insist on the continuation of the use of quinine against fever until a new remedy be discovered? And, finally, we must keep in mind that Tolstoi is not examining so much into the conditions which may lead a man to kill his neighbor, as into the unnaturalness of the state of affairs which forces one man to say to another about his neighbor, "Here, put him away, destroy him!" and yet, figuratively speaking, every criminal sentence does just that, and a death sentence does it literally.

To a man of Mr. Goldenweiser's mind, the most significant thing at the Washington congress was that the resolutions, as first passed by section IV[1] not only held that juvenile criminals should not be subjected to the penal procedure now applicable to adults, but that the procedure for adults also should change along the same lines; children, as in prophecy, leading the way. For example, in striking juxtaposition to the death chamber at Auburn, Mr. Goldenweiser put the cottages for boys and girls at Industry. This institution for juvenile delinquents left a profound impression. Englishmen and Hungarians also spoke of it. Said this Russian:

> A complete moral satisfaction was felt by us in such institutions as Industry where the work of rehabilitating the young is carried on in a manner that makes a man feel envious who has spent half his life as a trustee of a similar institution but without the means, the space, and the personnel of Industry. My especial admiration was excited by the men and women who voluntarily become fathers and mothers to the boys entrusted to their care. The "homes," gardens, and exhibits, and most of all the kind and cheerful expressions on the faces of the children will remain a sacred memory to all of us.

* * *

It is not necessary to take exception to particular points made by these criticisms. None of the delegates quoted held up any phase of the prison work of his own country in a spirit of superiority; they merely drew on their own experience, on standards which are winning a world-wide recognition, and on the impressions of a rapid survey of American institutions. The trend of their constructive suggestions is the important thing, and that was in line with the advocacies of progressive Americans.

Nor is it necessary to repeat the words of admiration spoken of American institutions and methods. Our probation systems won many advocates. "Elmira," said the venerable Dr. Guillaume, "is the Mecca for penologists the world over." Its discipline, drill and trade shops were especially complimented and the distinctive accomplishments of a dozen other American institutions were not overlooked.

In a sentence, the gist of the Washington congress from the international standpoint, was that the ideas for which America has stood in the reformation of the criminal have won the sanction of the world; that the theories which have been combated, have conquered; and that they have conquered on American soil where Europeans could see them in practice in our courts and institutions.

This in itself is high tribute to the men and women who in our leading states have borne the brunt of progress and have substituted the *treatment of the criminal* for the *punishment of crime* as the basis for the American program of social control. But it is not a counsel of finished labors or of proved theory.

If the American delegates to the London congress of 1915 can report the results of aggressive, widespread, effective movements to clear out the abuses in our city and county lockups, to secure state control of all convicts, and to break up our big prisons into smaller specialized units;—if they can report the working out of a scheme of prison occupations and industrial training free of the last vestige of the contract system and more comprehensive and flexible than any we now possess;—if they can tell of the universal institution of a system of prison education which will not have to depend at any point on convict teachers;—if they can give evidence of the development of professional standards among prison offi-

[1] Drafted by Prof. Maurice Parmelee of the University of Missouri.

cials and probation officers which will lift their callings to rank with those of internes and engineers (for the materials they work with are as delicate and exacting);—if they have secured the enfranchisement of all prisons from political exploitation;—if they can point to the rooting out of insanitary atrocities, and to the scientific organization of hygienic methods for making the prisoner well as a first step toward making him fit for society;—and if they can gather and present such complete statistical and other data as to reformatory and probation systems as will check up their results and demonstrate their effectiveness as against other methods of treating offenders,—then by our works, as well as by our espousal of theories and our prize institutions, will the democracy be known. If not, then it may well be that one of the older countries—mark what Japan is doing—shall wrest from us the leadership in giving a national application to the principles for which we have stood.

We are brought back, then, to the gist of this international congress, for Americans. With this I started. For beyond all else, its message was an indeterminate, a hard labor sentence to the people of the United States first of all to clear away our cage-like interior cells and our unhealthy and crime-breeding county jails. These are the antithesis of all that America has stood for among the nations. The city lock-up at Elmira, within five miles of the great reformatory, has for its sanitary equipment nothing better than a rank drain. It is well to remember the figures prepared by Dr. Ransom of Clinton Prison, Dannemora, N. Y., for the Budapest congress. They showed that from forty to sixty per cent of the deaths in our prison population are due to tuberculosis; while the average among people outside of prison is only fourteen per cent. In the words of one of the great American leaders, "So long as we tolerate these conditions, we sentence men to disease and death as well as to imprisonment." And this penal population, is a tidal one,—a hundred thousand men and women go in and out each year—the diseased prisoners return to the social body. The cage, thus, wreaks its revenge on the community. There is in this a tragic analogy with which to challenge our treatment of the criminal at every point, to the end that penal slavery be diminished, that we may be sure that such part of it as remains actually accomplishes its purpose. And that, during the next half century, as in the last, the institutions of the American democracy shall serve the cause of progress among all peoples.

I. THE SECTION ON CRIMINAL LAW

C. W. A. VEDITZ[1]

GEORGE WASHINGTON UNIVERSITY, WASHINGTON, D. C.

The first section of the International Prison Congress dealt with problems of penal law and was most largely attended by members of the bench and bar of the countries represented, and by university teachers of criminal law and criminology. Neither criminal law nor criminology has yet acquired the same academic dignity or importance in this country that they possess in Europe; and partly for this reason the section was dominated by the foreign delegates. Nearly all of the discussions were carried on in French, with but little use of either the German or English tongue. Judges, prison officials and professors of criminal law were in a large majority, and the debates were led by Professor Prins of Brussels, Professor Gleispach of the University of Prague, Professor Vambéry of the University of Budapest, Professor Lublinsky of the University of St. Petersburg, Professor Sherman of Yale University, Professor Wigmore of Northwestern University, Professor Ugo Conti of the University

[1] Dr. Veditz acted as interpreter for section I. The first two days the debate ran so high that translation was impossible. Near the close of the second session and the third session, he succeeded in making the interpretation a stated part of the program, and this helped to arrive at order and a good understanding, in which the Americans could join. His ready translation of difficult points in law and social theory was a matter of remark.

of Rome, M. A. Schrameck, director of French prisons, M. de Khrouleff, of St. Petersburg, chief of the Administration of Prisons of St. Petersburg; M. Spuch of the French Prison Society, Demetrios Castorkis, chief of the Greek Prison Administration; Dr. Dresselhuys, director of the Dutch prisons; Chief Justice Engelen of Holland, Superintendent J. A. Leonard of the Ohio State Reformatory, Warden R. W. McClaughry of the United States Penitentiary, at Leavenworth, and Dr. Frederick Howard Wines of Illinois.

The prevailing point of view appeared to be that of the criminal jurist, marked by cautiousness in phrasing proposals for a change in the present penal system, and hesitation in recommending changes of a too specific or too radical character. Inasmuch, however, as changes in the criminal laws of a country are more apt to be brought about through the influence of lawyers and judges and teachers of law than through ill-defined public opinion of a lay character, it is not unlikely that the resolutions finally formulated by this group will be more rapidly translated into actual legislation than those adopted by the other sections.

Three forenoons were devoted to the discussion of the first and most important question on the section's program, worded as follows:

> Assuming that a rational relation exists between the principle of the indeterminate sentence and the fundamental principles of criminal jurisprudence—
>
> (a) What class of delinquents should be submitted to and what class excluded from its application?
>
> (b) How may a sentence of this kind without minimum or maximum limits be applied without danger to individual liberty?
>
> If it is not admitted that there is a rational relation between the principle of the indeterminate sentence and the fundamental principles of criminal jurisprudence, is there ground for adding to the definite sentence with respect to a particular individual a restriction in the form of a supplemental penalty; and if so, in what cases, and how, is it to be applied?

Eighteen reports had been prepared on this subject and transmitted to the section—more than on any other topic on the program. Five were by American authors: Judge Simeon Baldwin, Amos W. Butler, Maynard W. Shipley, Eugene Smith, and F. H. Wines; the others were prepared by English, Swiss, French, Luxemburg, Italian, Spanish, Hungarian, German, and Transvaal authors.

A critical summary of these reports was presented by Prof. Gordon E. Sherman of the Yale University Law School. In his summary and in the discussion of the resolutions which he proposed, Professor Sherman maintained an entirely conservative point of view, calling attention particularly to the fact that the indeterminate sentence, especially the absolutely indeterminate sentence without maximum or minimum limit and applied to all classes of criminals, is by no means a prevailing "American institution"—inasmuch as few states have seriously contemplated going so far as this. Moreover, he did not regard the indeterminate sentence as consistent with the fundamental principles of criminal jurisprudence. He urged the retention of the principle of determinate punishment, but favored indetermination as a means of regenerative training in the case of youthful delinquents and as a measure of security applied to those who form a continuing menace to public order; furthermore, habitual or professional offenders should be subjected to "an ulterior judgment concerning the condition of the prisoner viewed as a menace to society" before he is turned loose again at the expiration of his determinate sentence.

The ensuing discussion made it clear immediately that the foreign delegates, notably those from the Latin countries, regarded the institution of the indeterminate sentence with scepticism. Justice Engelen of Holland thought it applicable only as a measure of safety in dealing with dangerous criminals. His compatriot, Director-general Dresselhuys, considered it unwise and inexpedient to replace the penal judge by a penitentiary judge; the former does his work in the full glare of publicity and usually uninfluenced by improper considerations, whereas the prison authorities are not subject to the same publicity and are more likely to be unduly influenced.

M. Silvela of Spain considered the principle inapplicable save in Anglo-

Saxon countries. It must not be forgotten, he said, that in Latin countries it has taken centuries to establish the principle of determination, and to substitute for the whim of the executive a clearly defined, definite penalty for offenses against the law. Indefiniteness as to the gravity of the crime, as to the rights of the accused, and as to the term and variety of punishment, were characteristic features of a tyrannical and unhappy epoch. To reintroduce indefiniteness would be running counter to popular notions of penal justice that are now a part of the public conscience in the Latin countries.

M. Castorkis of Greece accepted the principle of the indeterminate sentence, provided sufficient precautions are taken to make the board of conditional liberation competent and honest. Said the Greek delegate:

> The theory is that the criminal is a patient; he needs to be cured of his anti-social tendencies. But it is imperative to make sure that the physician is not a quack and that the patient will not be discharged until really cured. Upon this point the success or failure of the indeterminate sentence ultimately depends.

Most of the foreigners were laudatory and some of them enthusiastic, in their references to the American institutions in which the indeterminate sentence is applied,—such as the Elmira Reformatory. (Mr. Brockway attended the first and second meetings of the section). But they were apparently loath to accept the principle as a basic feature of penal law. Said one foreign delegate:

> In the minds of the people everywhere, the idea of imprisonment as a penalty, as a retaliatory movement on the part of the community against which the criminal has offended, is too natural and too deep-seated to be lightly brushed aside. There are, moreover, a number of offenders who are not really bad, who commit some minor offense as the result of exceptional circumstances which may never recur, (*criminels d'occasion* or *criminels passionnels*). For such offenders it would be absurd to apply a system of reformation; they have violated a rule of social conduct and should be made to pay a definitely prescribed penalty.

An ingenious attempt was made by Prof Ugo Conti of the University of Rome to graft certain indeterminate features upon the system of determinate punishments. "Recognizing the merits of indeterminate punishments," he proposed, "section I should refuse to accept indetermination as a fundamental principle, but might accept it as a means of public security to be applied in the case of dangerous criminals and of habitual recidivists as a sort of supplementary penalty to be added, if necessary, to the fixed period of imprisonment."

At this stage of the discussion the section appeared to be evenly divided between two apparently conflicting views: (1) that of accepting the indeterminate sentence as a basic principle, but circumscribing it by a series of limitations and qualifications; and (2) that of refusing to accept it as a fundamental principle, but grafting it upon the present system as a modification applied to specific, rather exceptional groups of offenders.

Whereupon Professor Prins of Belgium, the president of the section, declared himself an advocate of the "scientific principle of the indeterminate sentence" and asked for a vote for or against its acceptance—as applied to certain classes. "Either," he declared "we will have nothing to do with it in any form, or we would accept it for certain classes of offenders and with certain modifications. If a majority rejects it entirely, there is no need of further discussion." Put to a vote, the "scientific principle of indetermination" was then accepted. A majority also voted in favor of its application "to mental and moral defectives."

But how much further should its application be carried? A long debate on this question resulted in the designation of two committees,—one, consisting of Professors Conti and Sherman, favoring a very slight further extension of the principle of indetermination (to dangerous and habitual offenders in the guise of a sort of additional penalty), and the other, headed by Professors Gleispach of Austria and Vambéry of Hungary, going considerably further. The latter—contrary to the expectations of many of those present—won the day, after some changes in its propositions. Professor Gleispach stated it to be his belief that public opinion is ripe in many countries for making a big breach in the pres-

ent system of penal law. The resolutions finally adopted were as follows:

The congress approves the scientific principle of the indeterminate sentence.

The indeterminate sentence should be applied to moral and mental defectives.

The indeterminate sentence should also be applied, as an important part of the reformatory system, to criminals (particularly juvenile offenders), who require reformation and whose offenses are due chiefly to circumstances of an individual character.

The introduction of this system should be conditioned upon the following suppositions:

1. That the prevailing conceptions of guilt and punishment are compatible with the principle of the indeterminate sentence.

2. That an individualized treatment of the offender be assured.

3. That the board of control or conditional release be so constituted as to exclude all outside influences, and consist of a commission made up of at least one representative of the magistracy, at least one representative of the prison administration, and at least one representative of medical science.

Although M. de Khrouleff and others urged that a maximum and minimum period of detention should always be stated in the sentence, it was concluded that to fix a maximum is inconsistent with the principle of indetermination. "The whole theory," said M. de Silvela "is that the offender shall be held until he is reformed, and no one can tell in advance how long that will take. In fact, there is good reason to believe that many of those who are released are not really reformed but only pretend to be." He quoted several authorities to the effect that the supposedly "best" inmates at Elmira, for example, are not the best but the "foxiest"—those who are most successful in deceiving the authorities. But once the principle is accepted, it is illogical to fix a maximum period of detention in the indeterminate sentence. A final clause was adopted by the section to this effect:

It is advisable to fix the maximum penalty only during such a period as it may be necessary because of the novelty of the institution and lack of experience with it.

The Gleisbach resolution, in the form in which it was finally adopted, was thus tantamount, as its principal author himself declared, to the acceptance of the indeterminate sentence as a part of the general criminal law applied practically to all classes of criminals.

The two remaining questions discussed by the first section were of less general interest. The resolutions on the second, presented by Professor Sherman, (coupled with propositions advanced by M. de Silvela) urged more complete international exchange of records of crimes and convictions, through treaties and an international office of criminal records; and recommended that previous convictions in other countries (except for political offenses) be recognized by courts before whom foreigners are brought for trial. The third question, upon which an extended report was presented by the writer, concerned complicity in crime.

The resolutions unanimously adopted by the section were as follows:

1. It does not appear to be in conformity with the spirit of penal law to make of every preliminary agreement to break the law a special crime.

2. Noting the increase of offenses for which several persons are responsible, and that these offenses are committed chiefly by habitual criminals, *i. e.*, those most dangerous to society, it is desirable to consider participation as an aggravating circumstance and to augment the power of the judge to increase the penalty for such offenses.

II, THE SECTION ON PRISON ADMINISTRATION

WALTER G. SCOTT
MASTER OF POLWORTH, CHAIRMAN OF THE PRISON COMMISSION FOR SCOTLAND

The first day in this section was occupied in discussing the question, "What is the best method of securing effective and permanent work for those confined in small prisons?" Dr. Katharine Bement Davis of Bedford Reformatory reporting upon the papers submitted. After discussion, the following resolutions were adopted:

1. All penal institutions including houses of detention and jails, should be under the control of a central authority.

2. All persons whether sentenced for long or short terms, and whether confined in large

or small prisons should be employed at useful labor.

3. So far as local conditions permit, all persons serving sentences should be concentrated in institutions large enough to permit of the effective organization of labor leaving local jails and houses of detention solely for prisoners awaiting trial.

4. Where such concentration is not possible various kinds of labor should be introduced depending upon the economic conditions in a given locality.

5. It would be desirable that the large prisons with well organized industries and effective industrial equipments, should serve as training schools for the men who will later take charge of the smaller institutions.

6. The officials of small prisons should include if possible at least one man competent to direct industrial work.

It cannot be said that much fresh light was shed upon this difficult problem. The writer explained the nature of the work done in Scottish prisons, and pointed out that it is often an advantage to have some long term as well as short term prisoners in the same prison, as the former can carry out the more difficult processes of the industry while the short term men are occupied with the more elementary stages of the same work. Considerable discussion arose on the point whether prison officers should be trained in large prisons with a view to superintending afterwards industrial work in small prisons. Incidentally the question of work for prisoners awaiting trial was touched upon, and it was felt that the best course was to give them the opportunity, though they cannot be compelled to work.

Miss Davis explained the systems of labor as carried out in the United States as:

1. The lease system under which the whole labor of the prisoners is leased to a contractor who employs them in road-making or other form of contract work.

2. The contract system under which the whole labor is sold to a contractor who provides machinery, material and instructors, and pays the prison so much per day for the prisoners' work.

3. The piece price system under which a fixed price for articles manufactured is paid by the contractor who furnishes the material.

4. The state account system under which the state purchases the raw material, conducts the whole process of manufacture, and sells the product in the open market.

5. The state use system under which articles are manufactured only for the use of the state in its various departments and institutions.

Of these systems the last three were regarded as the best from the point of view of prison discipline and administration. Farm and market garden work was advocated for short term prisoners.

The second question submitted to the section was discussed on the introduction of Amos W. Butler of Indiana, viz., "What improvements may be made in the parole system or the system of conditional liberation already existing in certain countries?"

Among delegates who took part in the discussion were: Messrs. Rosenfeld of Germany; Scott of Scotland; Constantin of France; and Milligan of the United States; Canon Cooke of Canada, Messrs. Cameron of New Zealand; Almquist of Sweden; Woken of Norway; Kellerhals of Switzerland; Scott of New York (Elmira); and Sanagi of Japan; from which it will be seen that in the discussion the views of many nations were expressed. A committee of four, Van der Aa, Rosenfeld, Pope and Scott, was appointed to prepare and draft resolutions. These were submitted on the following day and as finally adopted were as follows:

Accepting the principle of conditional liberation on parole as an indispensable aid to the reformation of the prisoner, the congress approves the following resolutions:

1. Conditional release should be given not by favor but in accordance with definite rules. Prisoners of all classes, including workhouse prisoners, should be eligible for conditional release after serving for a definite minimum period.

2. Conditional liberation should be given on the recommendation of a properly constituted board, but reserving always the control of the government. This board should have the power of recalling the prisoner in case of unsatisfactory conduct.

3. The duty of caring for conditionally liberated prisoners should be undertaken by state agents, by specially approved associations or individuals who will undertake to befriend and help them and to report on their conduct for a sufficiently long period.

4. Where the ordinary rules for parole are not applicable to life prisoners, their cases should be dealt with by the supreme government as a matter of clemency.

In passing these resolutions, the section approved of the principle that prisoners

who have fulfilled certain conditions in prison shall be entitled to apply for conditional release before the expiration of their sentence, but that they may be replaced in prison if their conduct outside be unsatisfactory.

Having disposed of this subject, the section proceeded to discuss the first question on its program, "What are the essential principles upon which the modern reformatory prison should be based? and, Should there be special treatment for adolescent criminals?" In the absence of the appointed *rapporteur*, the writer reviewed the twelve papers prepared for the congress and gave a summary. The papers were contributed from England, Ireland, France (2), Switzerland, Italy (2), Spain, Russia, Belgium, Hungary, and Sweden. There was practical unanimity in favor of the principle that the treatment of all prisoners should be such as to give an opportunity for reformation and in particular that there should be special treatment for young prisoners aged from sixteen to say twenty-three. The discussion was continued on the next day when the following resolutions proposed by the writer were unanimously adopted:

A. The essential principles on which the modern reformatory method is based are:

1. That no prisoner, no matter what his age or past record, should be assumed to be incapable of improvement.

2. The conviction that it is in the public interest not merely to impose a sentence which shall be retributive and deterrent, but also to make an earnest effort for the reformation of the criminal.

3. That this reformation is most likely to be accomplished by religious and moral instruction, mental quickening, physical development and such employment as will place the prisoner on a good industrial basis.

4. That the reformatory system is incompatible with short sentences, and a relatively long period of reformatory treatment is more likely to be beneficial than repeated short terms of imprisonment under severer conditions.

5. That reformatory treatment should be continued with a system of liberation on parole under suitable guardianship and supervision on the advice of a suitable board.

B. It is strongly to be desired that a system of special treatment be adopted for adolescent criminals, whether recidivist or not.

C. Tribunals should be able to sentence to special treatment which (a) should be sufficiently long to permit of the full application of all possible means of reformation, (b) shall admit the right of conditional liberation as mentioned above.

The question of short sentence prisoners having been brought up on the consideration of resolution 4, Mr. Almquist of Sweden moved that the section express the opinion that prisoners awaiting trial and prisoners serving short sentences should be separately confined and as far as possible in separate cells. This resolution was also adopted by the section and transmitted to the congress as a whole; no doubt it gave expression to the feeling of surprise felt by many foreign delegates at finding in county jails in America both tried and untried prisoners associating freely in such a way that those who are afterward proved to be innocent, while awaiting trial for perhaps a considerable period, may have been subjected to contamination from the most depraved and hardened offenders. While this practice may prevail in a few European countries, it is very uncommon there, and its prevalence in America called forth much comment. In his closing words when accepting the office of president, Sir Evelyn Ruggles-Brise expressed the hope that some of the abundant philanthropic powers of America would be devoted to improving the condition of the short-time prisoners. As it was evident that the defects of the system are widely recognized, it may be hoped that ere long great improvements will be made.

The discussions in this section were under the able presidency of Professor van der Aa of the University of Groningen, Holland, who has been appointed the next secretary of the congress. His knowledge of many languages proved of great advantage as in this section all the discussions were carried on both in French and English. While it was to be regretted that no papers were contributed on the subjects before the congress from America, yet this was to a large extent atoned for by the remarks made by American officials and others during the meetings. Much of the discussion necessarily turned upon the best mode of expressing the feeling of the meeting, regarding which there was as

a rule little difference of opinion, but which it was not always easy to express accurately in resolutions in two languages.

All the resolutions adopted by the section were approved by the general assembly of the congress, and it is to be hoped that they may help advance the cause of prison reform in the various nations of the world.

III. THE SECTION ON PREVENTION

WARREN F. SPALDING
SECRETARY MASSACHUSETTS PRISON ASSOCIATION

The third section was under the presidency of Sir Evelyn Ruggles-Brise, of England. Of the four questions submitted to the section the first, in the order of consideration, was:

In what manner would it be possible to alleviate to the utmost the difficult position suffered by a family because of the imprisonment of the head of the family by organizing and applying to better advantage the prison earnings of the latter?

There was entire unanimity in regard to the unfairness and unwisdom of the existing system, under which the innocent family suffers more, in many instances, than the guilty offender. There was a strong feeling that the state, which for its own purposes takes away the wage earner and supporter of the family, should in some way lighten the burden of those dependent upon him. The preservation of the family, as a family was held to be important. It is social suicide to permit its destruction. It was thought by many of the members that the distressed family has a claim upon the state to make up the deficiency caused by the removal of its supporter, while others considered that the assistance of the family was a matter of policy rather than an obligation.

As to the best methods of relief, there was no agreement. Some held that the prisoner should have for his family a portion of his earnings, after deducting the cost of his support, but it was urged that many do not have profitable employment in the prison and that many of the most trustworthy are used about the prison, on its work and earn nothing.

Judge DeLacy of the Washington Juvenile Court brought to the discussion the results of the plan pursued by his court in dealing with non-support cases. A man imprisoned for non-support is provided with remunerative employment on public works, outside the prison. The family receives fifty cents a day while he is in prison. Imprisonment is not used until all milder measures have failed. The prisoner is not held for the full term of his sentence, but released on probation when he seems likely to support his family, and is compelled to support it; turning over his earnings to the police to be used for his dependents.

Judge DeLacy said that the system had worked well, and large sums had reached the families in this way. When fines are imposed, in non-support cases, they go to the wife and children. The expenditure from the public treasury is a small one. The moral effect is excellent. Many families are reconciled. Total abstinence is secured and the entire operation of the law is salutary. He would be glad to see the system applied to all misdemeanants. Its purpose is to compel men to fulfil their obligations. Those who are dealt with in this way have no feeling against the court.

The discussion of the Washington plan showed that much of its success depended upon the employment of prisoners upon public works, and many of the members were of opinion that that would not be tolerated in their sections. Much doubt was expressed as to the wisdom of having reports made to the police, which Judge DeLacy defended on the ground that it affords a helpful supervision.

It was urged by many that the allowance for the dependent family should not depend upon the actual earnings of the prisoners—that the needs of the family constituted the basis of the assistance. The prisoner does not control the matter of employment, and the aid should not

depend upon his earnings. On the other hand, a fear was expressed that the desire to support one's family might become a motive leading to the commission of crime. Judge DeLacy said, in reply, that every man wants to "get out," even though his family gains by his imprisonment.

The consideration of the subject resulted in the adoption of these resolutions:

Resolved, 1. That prisoners should be paid according to their industry. The amount thus allowed should be administered for them, to support dependents and to provide a fund for rehabilitation after release.

2. For the present it does not seem practicable for the state to carry out the full program of relief. Until that ideal shall be practicable it is advisable that committees of patronage and prisoners' aid societies should be the chief distributors of relief for the state, and furnish the same when not otherwise supplied.

A third resolution recommended that further information be obtained for the next congress.

The form of this finding was not acceptable to the general assembly, which referred to it back to the section where it was amended to read as follows:

Resolved, That it is desirable that the state should allow payment to be made to prisoners, and that steps should be taken to provide that any sum of money credited to prisoners should be available for the assistance of their families if in need.

In this form it was adopted by the general assembly.

The fourth question was:

Have the experiments of the last ten years made in certain countries, providing special establishments for the detention of inebriate criminals, even recidivists, for long periods (two or three years) been successful or not?

It was explained that the term "inebriate criminals" meant inebriates who have been arrested. Interesting information was given as to the English law and its results. It was brought out that it has not been fully effective because it does not clearly state who shall provide the institutions—a defect soon to be remedied. But there have been many recoveries, and on the whole the law is considered a success. Ireland has a successful reformatory for these cases, maintained by the state.

The Massachusetts experiment of treating inebriates in a hospital, though applied to a comparatively small number, was reported to have yielded good results. The state has authorized the purchase of a new site, and buildings will be erected in which the inmates may be classified, with long detention for chronic cases, and outdoor work for all.

The new New York legislation in this direction was spoken of as another recognition of the same principle.

There was a general agreement that a prison is not the place for inebriates; that inebriety should be treated in many cases as a disease; that long terms of detention are required; that the institution in which inebriates are treated should afford opportunity for outdoor work; that the system of short sentences to penal institutions is a failure, and that an effort should be made to secure the treatment of inebriety in its early stages.

The close relation between inebriety and insanity received special attention.

That alcoholism in parents resulted in insanity and feeble-mindedness in the next generation was urged as a reason for greater care in the treatment of the inebriate, and for a differentiation of the insane and the inebriate.

The second clause of this question was:

Is it necessary to complete the penitentiary discipline of these establishments (for the treatment of inebriety) by special medical treatment?

The discussion was brief, the sentiment being that medication was not necessary; but that medical direction of the hygienic work of these institutions was essential.

The section adopted the following resolutions, with substantial unanimity:

1. That the experiments of the last ten years made in certain countries, providing special establishments for the detention of habitual criminal drunkards for long periods, two or three years, have been successful.

2. That it is not necessary to complete the discipline of these establishments by special medical treatment, but it is essential to the success of the method that the hygienic and medical treatment of the inmates of establishments of this class shall be directed by qualified medical practitioners.

3. After having passed these resolutions the congress expressed the opinion "that further extension of this kind of detention of the inebriate criminal under state control with a view especially to arresting the habit in its

early stages and to the avoidance of useless and repeated sentences to imprisonment is desirable."

There was a very thorough discussion of the question, "What measures should be taken for the suppression of mendicity and vagabondage, especially in view of modern criminal tendencies?" Notice was taken of the difference between European and American vagrancy and mendicity, and also of the many classes to be found roaming about or living by beggary. The possibility of the industrial readjustment of some was urged as a reason for their special treatment; the mental unsoundness of others suggested other lines of treatment. The resolutions adopted by the section embody so fully the discussions that a detailed report of the latter is unnecessary:

I. The section reaffirms the resolution of the congress of 1895 as to the classification of vagrants and mendicants, as follows:

1. Society has the right to take measures of social preservation, even compulsory, against mendicants and beggars. This right involves also the duty, on the other hand, of systematically organizing public and private charity societies in aid of prisoners.

2. There is need of different treatment of mendicants and vagrants, according as they are

(*a*) Incapacitated or infirm, needy persons.
(*b*) Accidental mendicants or vagrants.
(*c*) Professional mendicants or vagrants.

3. The first need assistance until they shall have recovered the necessary ability to support themselves. The second class should receive public or private assistance or should be received in refuges or relief stations where work will be compulsory. The third class should be subject to severe repressive measures of a nature to check recidivism.

II. As a necessary means for aiding in the suppression of wilful and professional vagrancy and mendicancy, workhouses (*maisons de travail*) for professional mendicants and vagrants should be established. Within these institutions comprehensive systems of classification of inmates should be made, separating the inmates requiring discipline from the other inmates, and providing a class or classes for the more industrious or better behaved, with such inducements as are proper and conducive to the reformation and progress of the inmates toward rehabilitation.

III. Such workhouses should make a prominent feature of agricultural and industrial training, and the period of detention should be sufficiently long to provide for a thorough training, and also to act as a deterrent to offenders.

IV. The physical and mental condition of the inmates should be carefully observed and studied.

V. Conditional liberation and a system of subsequent supervision and, if possible, cooperation between official and outside charitable authorities are indispensable parts of a proper system of treating mendicancy and vagrancy.

VI. The extension or establishment of a system of identification and classification of professional mendicants and vagrants is advocated.

The discussion of the probation system was based upon the following question:

What is the effect upon criminality of the legal measures taken in different states in the form of probation or suspension of sentence, etc., to avoid the necessity for imprisonment, especially at the time of first conviction, taking account of the age, character and antecedents of the person? And is it desirable that these and similar laws be extended?

Justification for an affirmative answer to the question was furnished by Judge DeCourcy of Massachusetts, Homer Folks of New York, and other speakers. The importance of great care in the selection of probation officers was urged, so much depending upon their personality. The success of the system depends also very largely upon the views of the judge, regarding probation. Emphasis was laid on the fact that probation affords opportunities for careful studies of individual offenders and of the causes of crime. Probation has also had good results in changing the attitude of the community towards the criminal. The opinion generally expressed was that probation had reduced crime.

State supervision was strongly urged, as a means of raising the standard of probation and securing the best work.

The views of the section were summarized in the following resolutions, which were adopted by the general assembly:

1. That the effects of probation are beneficial when applied with due regard to the protection of the community, and to persons who may reasonably be expected to reform without resorting to imprisonment; and when the probationers are placed for a reasonable time under the supervision of competent officers.

2. That the effects of suspended sentence, without probationary oversight, are difficult, if not impossible, to ascertain.

3. That it is desirable to introduce and extend laws providing for probation, and to provide in each state, or country, some central authority which will exercise general supervision over probation work.

IV. THE SECTION ON CHILDREN

KATHARINE BEMENT DAVIS
STATE REFORMATORY FOR WOMEN, BEDFORD, N. Y.

It is significant that one-fourth of the time of the International Prison Congress was devoted to questions relating to children and minors, not only to juvenile delinquents but also to dependent and defective children, and that in point of membership this section was the largest in the congress.

Those registering here included eminent judges, lawyers, American probation officers and representatives of societies which work with children at home and abroad as well as individual social workers.

The countries participating in the deliberations of the section were, beside the United States, whose representation was naturally the largest, Canada, England, Scotland, Germany, Holland, France, Japan, Italy, Switzerland and Russia, while Sweden and Norway made important contributions to the discussion of the first question in the general assembly.

The first question, "Should young delinquents be subjected to the penal procedure applicable to adults? If not, what principles should guide the procedure applied to children and youthful offenders?" was the one on which the section put the greater part of its work.

The review of the sixteen reports prepared to answer it was by Prof. Maurice Parmelee of the University of Missouri. The discussion on the resolutions occupied the entire morning on Monday and more than half of the time of the three remaining sessions.

As the result of numerous amendments it became necessary to appoint a committee on revision. This committee consisted of the reviewer, Professor Parmelee, Dr. J. A. von Hamel, professor of penal law at the University of Amsterdam, and Juvenile Court Judge H. H. Baker of Boston. This committee recast the resolutions three times before they reached a form satisfactory to all. When submitted to the general assembly for ratification, so earnest a discussion arose from gentlemen from over seas who had been in attendance on other sections, that it was necessary to return them to the fourth section and appoint a special hour for the final discussion at which all could be present.

There was from the first a complete agreement on the proposition that young delinquents should not be subjected to the same procedure as adult criminals. The differences arose over the various points of procedure in the juvenile court. The section was fortunate in having in its membership so large a representation of legal men who could present accurately the present procedure and the possibilities for the future for their respective countries.

In some ways the United States occupied middle ground. It was satisfied to leave the cause of the youthful offender in the hands of juvenile court judges. The Scandinavians did not wish to have judges deal with juveniles at all, but special commissions appointed for the purpose.

The Americans wished to recommend the elimination, so far as possible in juvenile proceedings, of the prosecuting attorney and the counsel for the defense. The French were entirely unwilling to agree to this.

The Italians felt that the same judge or body which dealt with delinquents should also have cognizance of certain cases of abandoned or dependent children. This was opposed by Anglo-Saxons, but a resolution offered by Count Conti of Rome was finally adopted in a modified form.

M. Danjoy, chief of bureau of Prison Administration, France, was earnest in his advocacy of women on the bench, or in commissions appointed to handle cases of young women or of juveniles under twelve years.

The most interesting feature of the entire discussion was the earnestness of the debaters and the importance attached by all to the adoption of resolutions which should represent not only what

was best in present practice, but what should be an ideal toward which to work.

Considerable time was spent on phraseology in order to make each resolution represent the exact idea intended—the continentals think us slovenly in this particular—but it was necessary occasionally to remind the section that after all the resolutions were an expression of an opinion and had no legislative force.

In their final form the resolutions adopted were as follows:

I. Young delinquents should not be subjected to the penal procedure now applied to adults.

II. The principles that should guide the procedure applied to young delinquents are as follows:

1. Those who are entrusted with the cognizance of the cases of young delinquents should be primarily chosen for their ability to understand and sympathise with children and should have some special knowledge of the social and psychological sciences.

2. They should have the assistance of probation officers to make preliminary examination in each case and to watch over and help those put on probation.

3. There should be made in connection with the cases of young delinquents, such examinations as will contribute to the fund of information on juvenile delinquency and the results should be used whenever practicable to help in the disposition of the case. Medical examinations should be made only by physicians who have some special knowledge of the social and psychological sciences. The personal information obtained in these examinations shall not be made public.

4. Whenever possible in the case of young delinquents, arrest should be avoided in bringing them before the authorities and orders for arrest should be issued only in exceptional cases.

5. When necessary to detain young delinquents, the detention should not be in quarters used for adults.

6. In those countries where a court is entrusted with the cognizance of the cases of young delinquents:

(a) Such cases should never be heard at the same session with adults, and

(b) It should be the tendency in the trial of juveniles to proceed as far as practicable by way of conference for the good of the child instead of contest about and over the child.

III. Those who are entrusted with the cognizance of the cases of young delinquents should also have the cognizance of the measures needed in the interest of abandoned or maltreated children.

The reports on question II, "Should special establishments be maintained for abnormal, backward and feeble-minded children showing dangerous moral tendencies?" were reviewed by Dr. William J. Healey of Chicago, Ill.

On the main question of separating the feeble-minded of criminal tendencies from the general class of feeble-minded, there was radical difference of opinion. To the Americans the most interesting view was that presented by Dr. Goddard of Vineland, N. J., who was present and declared most emphatically that segregation of the feeble-minded with criminal tendencies was not only unnecessary, but positively unwise.

Inasmuch as the question seemed one to be decided by practical experience and expert judgment, there was little discussion, and the following resolution was unanimously adopted:

Resolved: That it is the sense of this section in discussing the question of the establishment of separate institutions for mentally defective children with dangerous moral tendencies, that too little practical investigation of the subject has hitherto been undertaken for us competently to render a verdict. We, however, earnestly recommend that investigation be rapidly undertaken by well-qualified persons under private initiative or state authority—using the mental tests and classification which prominent students of the psychology of abnormal children have agreed upon, and working with clear definition of the ends in view—such investigation to be primarily directed towards ascertainment of:

I. How many children numerically and proportionately there are:
   (a) with dangerous moral tendencies in institutions for abnormal children,
   (b) with mental defect in institutions of the reformatory type, or who come before juvenile courts.

II. How the directors of such institutions:
   (a) regard the desirability of such cases as inmates of their institutions.
   (b) find it advisable to treat them;
   (c) estimate the success of their efforts.

Isabel C. Barrows of New York reviewed the eleven reports submitted in answer to question III, "What measures should be taken to correct idleness and vagabondage of children in large cities?"

In the reports, as in the discussion which followed, those taking part laid the emphasis upon this or that special means of prevention, but there was no difficulty in arriving at a consensus of opinion. Ella Flagg Young, superintendent of public schools of Chicago, and Mrs. Emmons Blaine led the discussion

on resolution II. There was an inclination among those specially interested in education to go into detail as to methods, but lack of time and the recognition that technicalities had better be left to specialists soon brought about an agreement, and the resolution was adopted with some amendments.

The resolutions on question III as finally adopted were:

It is resolved that to prevent habits of vagrancy and idleness among children in large cities there should be:

I. Laws making parents responsible for the wrongdoing of their children; compelling deserting fathers to return to their duty or to support their children; allowing children to be taken from unfit homes and be properly placed for training and care.

II. Greater co-operation between school authorities and the public; better adaptation of school curricula both in interest and in practical use to the individual needs of the children; and that there should be more kindergartens and greater recognition of training in handwork for the children.

III. Vast additions to playgrounds, wholesome recreation centers, gymnasiums and athletic fields as the surest preventives of juvenile mischief and crime, and as affording young people places where they may learn to bear defeat with courage and success with modesty.

IV. Lectures to parents on practical subjects that shall tend to make better and happier homes as the wisest way to keep children from the idle wandering life.

V. A stronger influence on the part of the press and pulpit to enforce the sentiment that the best bulwark against juvenile delinquency is to care for the children in such a way as to prevent them from becoming vagrants and idlers.

Only four reports had been submitted on question IV, "Are special measures necessary for the protection of children born out of wedlock and if so what measures?" These were reviewed by Jessie D. Hodder of Boston, who had drafted eight resolutions expressing what seemed to many radical and even revolutionary views. Delegates from the United States, France, Holland and England took part in the discussion.

Every speaker recognized the deplorable position of the illegitimate child in our modern society, and desired to alleviate it. The difficulty seemed to be in knowing how far it was safe to go in order not to seem to endorse illegitimacy or to strike a blow at marriage and the sacredness of the family. All agreed that the illegitimate child had an equal right to care and support. Considerable difference of opinion was expressed as to the right of inheritance, but the three words were all finally allowed to stand.

France was willing to vote for resolution V, that illegitimate children may legally acquire their father's name, provided an amendment was added that this should be only in cases where the father was unmarried. After rather sharp discussion the resolution was rejected as was also the eighth, which demanded social propaganda directed toward giving to illegitimate children "the place in the family group to which their blood relationship entitles them."

Six of the eight resolutions proposed were therefore adopted in the following form:

1. That in the opinion of this congress legislative measures and moral and social propaganda are necessary for the protection of illegitimate children.

2. That the object of legislative action should be so to modify existing laws as to make the care, support and inheritance of illegitimate and legitimate children as nearly as possible identical.

3. That after the nursing period is over the decision as to which parent shall have the future care of an illegitimate child should be based upon the child's best interests and its needs as a future citizen.

4. That whichever parent has not the care of the child should contribute toward its support and education.

5. That as illegitimacy is often the result of ignorance, it shall be the object of a moral propaganda;

a. to instruct young people in matters of sex and its relations to the life and welfare of the state.

b. to help build up a single moral standard applicable to men and women alike.

6. That as girl-mothers often attempt abortion, abandonment of their child, or drift into prostitution, it shall be the object of a social propaganda to have connected with hospitals and all institutions where such girl-mothers may go for advice and care, a trained staff of workers whose duties shall be

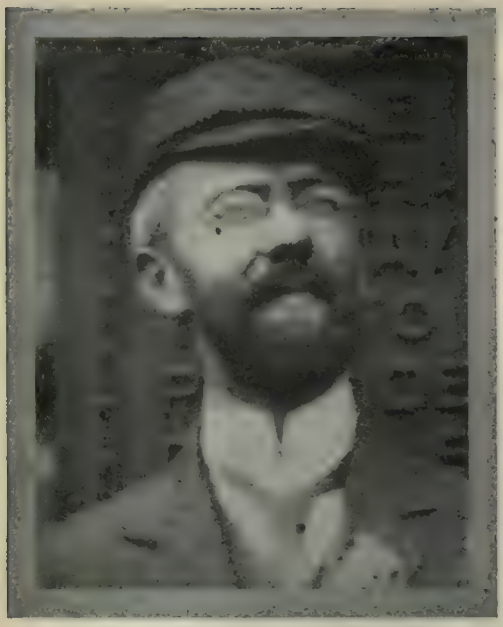
a. to instruct said girl-mothers in the care of herself in view of her child's needs before and after birth.

b. to secure from the child's father acknowledgment of paternity and the necessary financial provisions.

c. to act as friend to the mother, and guardian or trustee for the child.

THE PERSONAL SIDE OF THE CONGRESS

ISABEL C. BARROWS

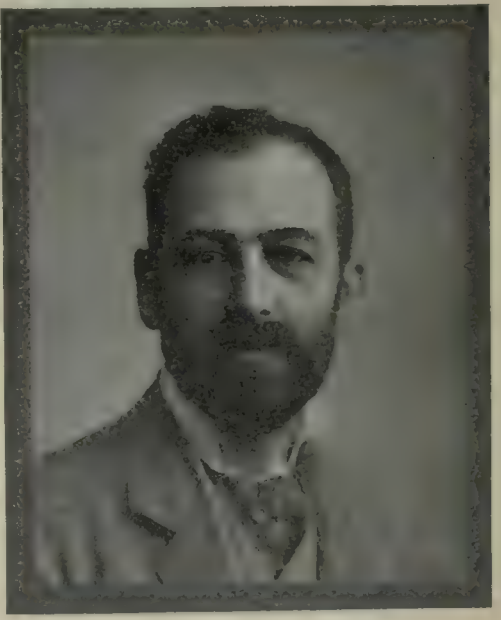


It is asking a good deal to demand sketches of about ninety persons from thirty-four different countries. One cannot evolve the personal history of these penologists from his own brain, as the scientific German did the extinct animal, but happily certain facts have been furnished by the members of the Prison Congress for the basis of what can be said about them. Of their early life none of them has spoken. To read their brief notes one might believe they had sprung to life in full feather, like Minerva from the head of Jove. They mention only their university degrees, the offices they have held, the books they have written. How and where they spent their childhood, what were the influences that directed their lives, how they chanced into the paths of penology, are unknown facts, and unhappily the writer of this article may not venture into the realms of fancy to supply the missing information. Yet the data in hand afford some glimpses of what manner of men they were who crossed the seas to discuss penology.

JULES RICKL DE BELLYE, HUNGARY.
Councillor of the ministry; chief of the prison system; president of the International Congress at Budapest in 1905.

The countries represented were the Argentine Republic, Austria, Belgium, Great Britain, Canada, China, Colombia, Cuba, Finland, France, Germany, Greece, Guatemala, Haiti, Holland, Honduras, Hungary, Italy, Japan, Liberia, Luxemburg, Mexico, New South Wales, Norway, Queensland, Russia, Salvador, Siam, Spain, Sweden, Switzerland, Tunis, Turkey and Venezuela. From this large number only a few could be chosen for biographical sketches.

From Austria came Count Gleispach, professor in the University of Prague, an earnest, eager speaker, who took an active part in the work of the section on criminal law. It might be said that Austria sent the Hungarians also, but they are rather the leaders, since Hungary is officially related to the congress, having one member on the commission, Rickl de Bellye, who was also the president of the last congress, in 1905. He and his brilliant wife, who speaks five languages, and kindly in each, were faithful attendants. Rickl de Bellye belongs to the Hungarian ministry of justice. He was born in 1851 in the broad plain of Debreczen, where untold miles of prairie-like level stretch out before the traveler, with great handsome oxen plodding over the fields, herds of geese guarded by little girls by the wayside, and innumerable locust trees, descendants from locusts imported from America. From the home of his father, a landed proprietor, he went to various



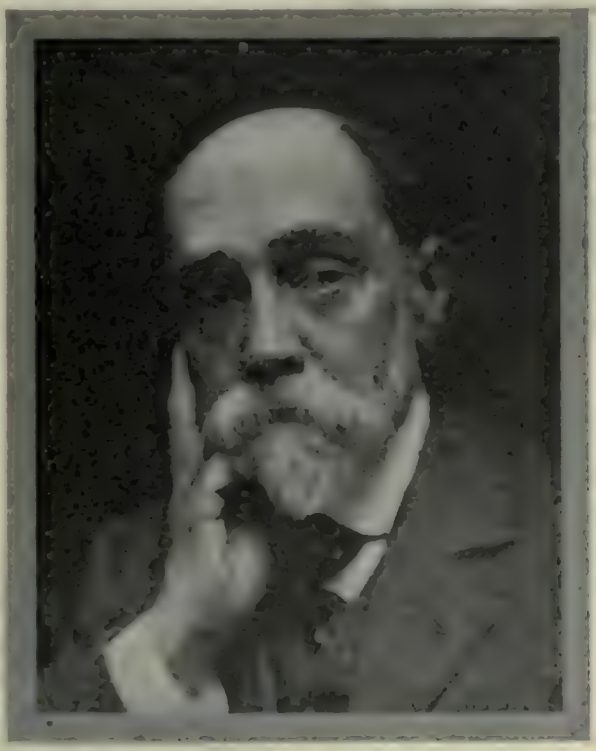
VENCESLAS GLEISPACH, AUSTRIA.

Doctor of law; professor University of Prague. It was Professor Gleispach's resolutions on the indeterminate sentence which were passed by the congress and marked the great advance of the decade.

colleges, taking his degree in Budapest and afterwards studying in Berlin, England and Belgium. Like other continental young men he had to perform a certain amount of military service and was lieutenant of the Hussars, teaching in the military school at the same time and finding, in those care-free days, leisure for translating a tragedy which was played in his native city. His military duties at an end he became an attaché of the minister of justice and was assigned to the penal section about the year 1876. At the sixth International Prison Congress in Brussels in 1900, he was the only delegate from Hungary. At the seventh congress in Budapest he was the president, exercising in addition a charming hospitality in his own home. For his services in that congress the Americans gave him gratitude, but the emperor of Austria, the tsar of Russia, the kings of Norway and Greece and the queen of Holland sent him decorations. Who shall say which way the balance tips when these are weighed against each other? He is at the head of the entire prison administration of Hungary, including juvenile reformatories, of which they have several wonderfully good examples in that far away land. He belongs to the Society of International Law, the League for Protecting Children and many other organizations. When Hungary celebrated her thousandth year he contributed a chapter on her criminals to the nine large volumes which told her story.

Hungary sent also Dr. Vambéry and Dr. Finkey of the University of Budapest, Dr. Waldhauser of the society of jurists, and Dr. Szilegyi of the Hungarian Charity Organization Society. Dr. Vambéry is the son of the well-known Arminius Vambéry and had the advantages of study in Budapest, Halle and Geneva. He is still a comparatively young man, though he has been a judge for ten years and the list of his publications includes nearly twenty titles, most of them relating to penological subjects.

Belgium was represented by Professor and Mrs. Adolphe Prins, who have been studying American institutions with zeal during their weeks in this country. Professor Prins is general inspector of prisons and if he inspects his own establishments with as much kindly earnestness

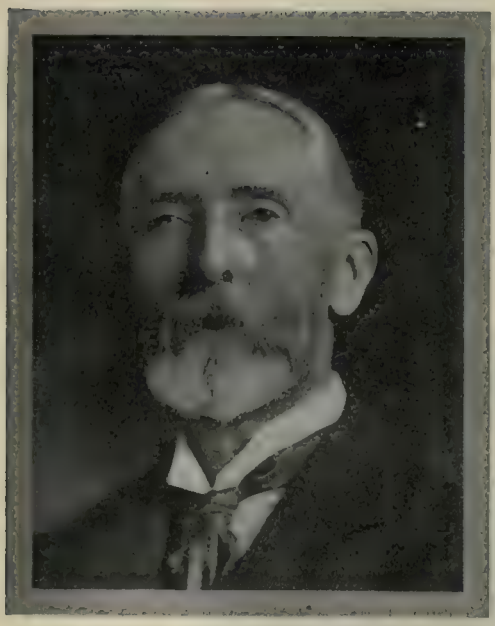


R. VAMBERY, HUNGARY.

Royal attorney; professor University of Budapest; a progressive in the debates on the indeterminate sentence at Washington.

and painstaking observation as he has given to our own he must not only elicit cheerful information, but make friends with everybody with whom he comes in contact.

Great Britain sent a fine group of men and one woman, but as grandniece of Elizabeth Fry and granddaughter of Sir Thomas Fowell Buxton, the famous abolitionist and prison reformer, Mrs. Scott well balanced the other sex. Her husband, Walter George Scott, head of the prison system of Scotland and chief of the clan of Scott, is a nephew of Lord Aberdeen and has several high-sounding titles of his own, but they meant so little to American ears that they were quite ignored in addressing him. He himself is so independent of any outward honor that could be bestowed on him that, to tell the truth, we forgot them. It was a case of "the man's a man for a' that." In this country at least he was as simple as any of us and he and his wife, his manly son and charming daughter, captured our democratic hearts.



Photograph by Campbell.

ADOLPHE PRINS, BELGIUM.

Professor, University of Brussels; general inspector of prisons; chairman of the section on criminal law of the Washington Congress.

The head of the Irish prison system, J. S. Gibbons, a man as modest as he is intelligent, has long been connected with this work and under his régime the Irish prisons show good results, especially in the matter of health. Captain Arthur St. John of the Penal Reform League was another quiet Englishman, who was never idle here any more than he is at home. Then there was Major H. S. Rogers, who, after serving in India for years, has come back to England to build her prisons as the national architect, under the old name of chief surveyor. His tall, handsome figure and striking head called the attention of many a stranger as he sat in the meetings, and once—just once—when he was persuaded to lead the Sir Roger de Coverly in an improvised dance to while away the time when waiting for a train on the long excursion. The special gospel that he had to preach was the value of direct sunshine in prison cells. He would have met with a warm welcome from his friend, Mr. Barrows, for that was one great reform which he, too, hoped to bring into prison construction in this country. The prisons erected under Major Rogers are models in many ways, but in nothing more than in the fact that no corridor keeps the light from flooding the cell where the prisoner spends ten hours out of the twenty-four. America is far behind in prison structure in this respect. Yet here tuberculosis is our dread enemy, and the released prisoner spreads in the community the disease he may have contracted from lack of direct sunshine when behind the bars.

Yet another man from Great Britain was Thomas Holmes, secretary of the

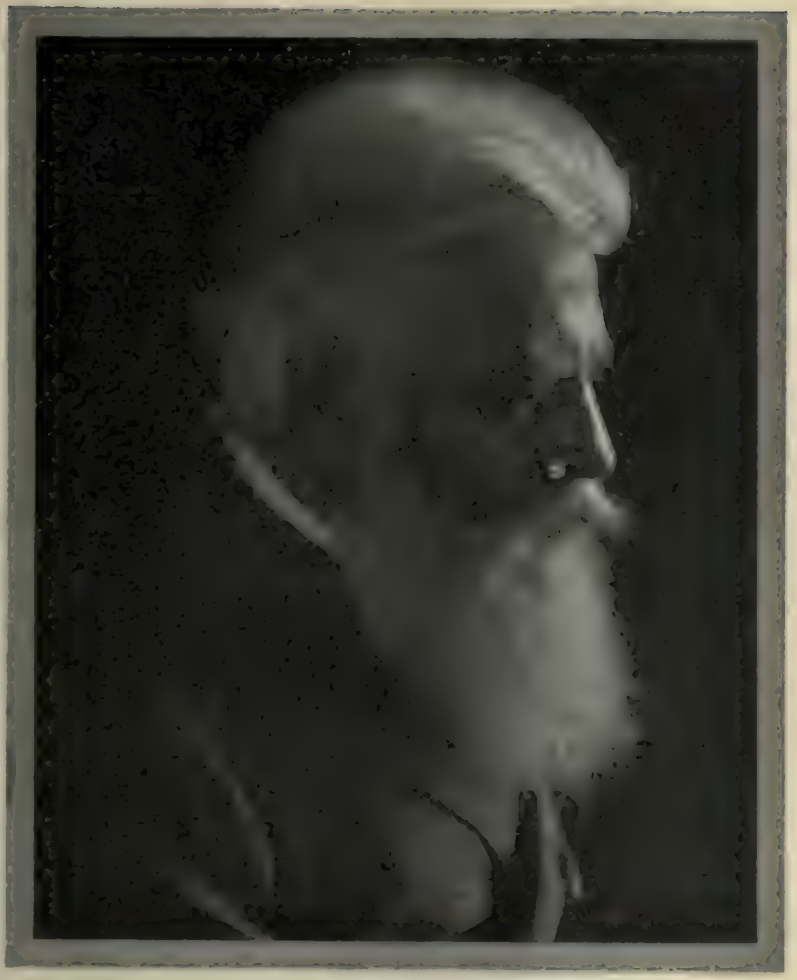
J. S. GIBBONS, Ireland.
Chairman, Prison Commission.

Howard Association. He looks for all the world like the Laird in Trilby—with his whiskers, the twinkle in his eye and the pipe in his teeth. At the age of eleven he went to work as a parish apprentice in the foundries of the black country and worked until he was thirty-seven, when a serious accident threw him out. His hours were fourteen a day and he got up between four and five in the morning and read and studied. He studied at night after he should have been in bed. Then he came down to London and got work as a missionary. I told him about the twelve-hour day in the steel mills in this country. In England they work nine. He said:

> If any man works twelve hours a day at the usual rate in the iron works it is a scandal and a danger. Good gracious, what time have they to develop the best part of a man; I know what it cost me to study before I went to work at six and after I got back at eight. No reasonable man ought to be called upon to make that sacrifice. The country loses when it asks a man to do that; no wonder that among working people, the brains lie fallow; and only now and again can a man with remarkable abilities break out.

One of the parish apprentices that Mr. Holmes grew up with as a boy is now a leading engineer and railroad man on the Pacific coast. Holmes has the same veneration for a book that Carnegie has. As a boy he knew many of Macaulay's essays and poems by heart because those were the few books he could reach. A book was prized very much and thumbed over and handled with care. There were so few of them within reach. But along with this appreciation of the value of books, which many of us take for granted, he is dignified and vigorous in maintaining that conditions of life should be such that books could be used. Books and a long working day are to him antagonistic. There this English iron worker oversteps Carnegie, who has distributed the one as no man who has ever lived, but who has not raised a hand to stay the other.

Sir Evelyn Ruggles-Brise, who was elected president of the commission for the next five years, is president of the English prison board and a wise and rational prison reformer. In his hands the International Prison Commission may look forward to a successful congress in London, five years hence.



There was a wide variety of faces and heads as one looked about over the

WALTER GEORGE SCOTT, Scotland.
Master of Polworth, Chairman Prison Commission.

Washington gathering. The three Canadian delegates, for instance, offered a striking contrast in physiogonomy, to the three from Cuba, but beneath the fair, as beneath the darker skin, the same earnest desire for the betterment of existing conditions was burning.

It took no skill to select the most picturesque face in the crowd, and the character of the man was as interesting as his face — Victor Nybergh of Finland. Of himself he would not speak. When asked to furnish some facts for this article, he contented himself with saying that he had grown gray in prison service and then he began to tell of the splendid work of Baroness Mathilda Wrede, the Elizabeth Fry of Finland, who devotes herself to prisoners and their families and inspires prison officials with renewed courage and hope, teaching them not to tire in their work which so frequently fails to show the expected results. And then he hastened to add, that we may know she is not the only woman caring for her fellows, "The Finnish women have obtained universal suffrage and there is now ready a proposition for prohibiting the sale of intoxicating liquors." Too well he recognizes the connection between crime and drink. Mr. Nybergh is director of one of the largest prisons in Finland, with eight hundred men in his charge. Personally he has more faith in preventive work and looks with great anticipation on what is being done by the four schools for delinquent youth and the schools for neglected children in his own country. In what he calls our rich and wonderful America he has met friendship and hospitality. The Washington congress, the third which he had attended, rounded up a three months' tour of American institutions in more

Photograph by Barrach.

VICTOR NYBERGH, FINLAND.

This private representative of the Switzerland of the North was the most striking figure among the foreign delegates.

than one of which he has been called "the children's Santa Claus, the man with the bright eyes who always looks on the bright side of things." People who come and go at international congresses are like ships that pass in the night and yet one can but feel a pang as they sail away. Among those who will be remembered with this regret is this man with the clear-seeing eyes and the warm heart.

It is encouraging to those passing away from the field of action to see young men coming up to fill the vacant places. There are many. Among them is Bolzidar Markovitch of Servia, professor of law in the University of Belgravia. Though only thirty-five he has published many things concerning penal procedure and other legal subjects. His German studies were made in the universities of Freiburg and Munich and he was a member of the Budapest congress. As minister of justice he has exercised much influence in his own country. Another of the active younger members of the congress was Paul Lublinsky, professor of law in the University of St. Petersburg, who first saw the light in the grim city of St. Petersburg in 1882. Possessed with a desire to make his own way in life, he began to teach at the age of thirteen, for the love of it, and at fifteen was already earning his living as an instructor. It is not strange that so gifted a lad was sent by his university to study in England and Germany, nor that he carried off gold medals and other honors, so that by the age of twenty-five he held a professorship. By his winning personality he won many friends this side of the sea and proved a living illustration of his name, whose root is the Russian word for "love."

ETIENNE DE KHROULEFF, RUSSIA.

Commissioner; chief of the Prison Administration of the empire whose statements as to Russian prisons provoked an active newspaper discussion.

Another Russian professor, from the University of Moscow, was Mr. Poznycheff who has been a prolific writer on penological subjects as well as on almshouses and reformatories. One of the titles in his list awakens a desire to see what a good Russian subject could have to say on it, Crimes against Religion, Considered from the Point of View of Liberty of Conscience.

In the notes furnished by Mr. Loutchinsky, editor of the *Russian Messenger*, he tells of his first interest in criminal matters when as a tutor he was sent to Switzerland with an abnormal youth with dangerous moral tendencies. On his return to Russia in 1888, he entered government service, where he received promotion after promotion as prison inspector, judge, and state councillor. He afterward went to Germany to study the method of identification by finger prints and is at the head of the Russian bureau which requires finger prints of those refusing to give their names and civil and social position. He has also studied juvenile reformatories in Paris, Vienna, Prague and France, to which he has added his American studies in the same direction. Among his numerous publications are several on the indeterminate sentence and conditional release as practiced in America. Whether his earlier ideas were confirmed by his visit to this country, or whether he will look on these reforms with a more lenient

eye after seeing our institutions, the readers of the *Prison Messenger* will learn.

Naturally the head of the prison department of Russia attracted great interest in this country, for no other man at the congress has it in his power to wield an influence for weal or for woe in 1,200 prisons. After finishing his studies in the University of St. Petersburg Mr. Khrouleff devoted himself to law, rising by degrees till he reached his present influential position. He has not only been interested in the question of prisons, but in reformatories for youth and in prisoners' aid societies. It is said that wherever he has been stationed he has developed guardian societies to look after discharged prisoners. In addition to his judicial work he has found time for writing, and one of his papers, on the compensations due to those who have been falsely sentenced through errors of justice, attracted much attention.

E. S. GOLDENWEISER, Russia.

Mr. Khrouleff was ill-pleased with much that was said of him and his prisons in the American papers. Nor were Americans well-pleased that his French biographer in this country quoted S. J. Barrows to sustain Mr. Khrouleff's claims for the excellence of Russian prisons. As I was with Mr. Barrows in Russia and visited some prisons with him I may perhaps say here, what I have refrained from saying in the daily papers discussing this theme, that it is true that he found features in Russian prisons which he thought worthy of adoption. But it must be remembered he was studying construction, with a view of getting the best for the New York prison to take the place of Sing Sing. He therefore studied only the newest structures in each of the thirteen different countries through which we passed on that memorable trip. In these, he praised the large cells, the direct sunlight in those cells and some other features. The question of administration he took no notes upon, but I recall his speaking with commendation of the outdoor exercise to which every prisoner in Russia was entitled. But there need be no uncertainty on the subject, for Mr. Barrows made an official report on European prisons, including those of Russia.

I might venture to state that Premier Stolypin admitted to me personally, when I saw him in Russia last year, that the prisons were frightfully overcrowded, that typhus fever and tuberculosis were rampant in them, and that the question of prison labor was a terribly vital one in Russia. Strange to say my suggestion to Russian officials that they could relieve the overcrowding by releasing political prisoners did not meet with favor! When Mr. Barrows was asked, "What do you do with political offenders?" he laughingly replied, "We turn them down at the next election."

Mr. Khrouleff is not ignorant of Russian conditions. He has served in many parts of that vast empire, and made visits to the penal settlements of Siberia. He has seen European and American institutions and marked the results, and if in his great field he does not adopt the best means of treating criminals he will sin

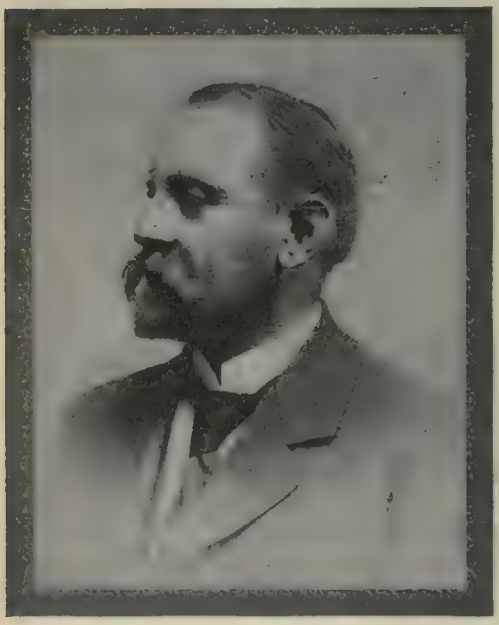
M. A. SCHRAMECK, FRANCE.
Director-general of Prisons.

against the light. He has it also in his power to lessen the sufferings of political offenders, and will command the gratitude of civilized countries if he takes advantage of his power and undoubted ability to lighten the hardships of prisoners of every kind. Such work is needed in Russia.

The chief prison physician of the great prison in Moscow was also present. He has travelled much in Europe and has written concerning prison sanitation and occupations. Among others from Russia were Mr. and Mrs. E. S. Goldenweiser of Kiev, people who moved so quietly on their way that only a few learned to appreciate their great worth. The Washington meeting was the occasion of an interesting family re-union, for the interpreter of the third section of the congress was their son, a member of the staff of the Federal Immigration Commission and translator of his father's essay on Tolstoi's Resurrection. This essay, which has been translated into several European languages, was issued as a sixty-page pamphlet and distributed to members of the congress, with a letter of introduction from Count Tolstoi, in which the great social philosopher of Eastern Europe stamps as unreasonable and immoral "that strange institution which is called a trial." To Mr. Goldenweiser, the part which the Resurrection will play in combating criminal slavery, will no doubt be similar to that played by Harriet Beecher Stowe's novel in the abolition of Negro slavery. "Tolstoi's task is a heavier one; he attacks an institution which is everywhere considered normal and necessary, whereas Mrs. Stowe was indignant at a practice which was condemned as a disgrace by the entire civilized world." "What exists must do so no longer: What will take its place is another question."

France sent six representative men, Mr. Schrameck, director of the French Prison system; Mr. Constantin, general inspector; Mr. Danjoy, chief of the Bureau of Prison Administration, and Messrs. Spuch, Bok and Blum.

Holland, too, was well represented. The first name on its list of nine was that of Dr. Simon van der Aa, commissioner for Holland and professor of penal law in the university of Groningen. Dr. van der Aa has attended several of the International Prison Congresses. At



VICTOR ALMQUIST, SWEDEN.
Chief, Division General Prison Administration, Stockholm.

children, on vagabondage, intemperance, prisons and workhouses. He has written much concerning Norwegian prison affairs. For both Norse and Swedish delegates, the Washington congress was the fifth.

But all the wisdom did not come from the north. It was pleasant to meet from Spain men whom we had greeted in Madrid, and the men from Greece were Budapest acquaintances. Names only can be given; from Spain: Doctors Silvela y Corral, Cadalso and Valdes, each representing prison work and all faithfully attending the sessions of the congress. From Greece Messrs. Skousis, Gounarakis, Castorkis and Typaldo-Bassis. The last may have been a descendant of Ulysses; he came at least from Ithaca. He is a member of the International Court of Arbitration at the Hague and has been a member of the International Prison Commission since 1896, but it would take pages to tabulate all the other distinguished posts he has held in artistic, historic, monetary, agricultural, archeological and scientific societies, representing them at national and international sessions and writing voluminously. Probably there was not another member of the congress interested in so many subjects from the protection of useful birds to the production of drama.

Mr. Skousis is the son of Helena Skousis whose father in 1826 blew himself up that he might not fall into the hands of the Turks at Missolonghi. His son was born in the house of his grandfather, the house in which Lord Byron died. He has been much in diplomatic service in Vienna, Berlin and Paris, and has attended five of the congresses, acting as vice-president on three occasions.

The three Italian members were easily distinguished. No one who ever saw the towering figure of the Roman Senator Pierantoni would be likely to forget him. On the tour about the country, the Pullman berths were too short for him and he had to be accommodated on a couch in the men's dressing room. Next was the gentle Abbé Bianchi, who never missed a session and no matter how hungry always sought out a church before a restaurant. Of all the writers of papers

FREDERICK O. A. WOXEN, NORWAY.
Secretary-general, Department of Justice; chief Prison Administration.

D. E. CASTORKIS, GREECE.

for the congress he was the only one who urged gymnastics as a moral influence for young people. Count Ugo Conti was the third Italian, an ardent reformer, a man of deep feeling and warm, human sympathies, and a leader in the discussions of criminal law. Delegates from the Orient were also present. The Chinese attended their first prison congress, but one of the delegates from Japan made the long journey in 1905 to attend the Budapest congress.

It was Switzerland, the land of liberty and progress, that sent the literature of the congress with the men who came to represent her. The papers prepared for the congress are translated into French and distributed from the office of the secretary, Dr. Guillaume. Fifteen large cases brought them across the ocean. In addition, at Washington, a daily *Bulletin* was printed of which Dr. Borel, professor of international law in the University of Geneva, was editor. No man in the conference was busier than he, but no one had more time, tact and quick discernment. In the confusion sometimes arising from diversity of tongues as well as of ideas, it was his serene decision that smoothed out the roughest places. His knowledge of the laws of many lands, his unfailing courtesy and genial kindness made a deep impression and more than one American said, "Why doesn't one of our big universities try to transplant that man to America? He would take root here."

UGO CONTI, ITALY.

Professor, University, Superior Colonial Institute of Rome, delegate of the Italian government; a conservative leader in the debates on the indeterminate sentence.

ERNST ROSENFELD, GERMANY.

Secretary of the International Criminalistic Association.

Dr. Borel is the son of a sister of Dr. Guillaume, for forty years secretary of the congress, who with the Washington meeting, laid aside his labors. They inherit the same splendid traits from the same ancestry—goodness and learning.

The father of Dr. Guillaume was a lawyer living in Verrieres—Suisse, canton of Neuchatel, when Luis Guillaume was born, the oldest of eleven children. His mother was one of the remarkable women who have had great influence over remarkable sons. She was an eager reader of scientific books. At the time when the writings of the French encyclopedists were contraband, they were printed in this little Swiss village and thence smuggled into France; but many copies were left there. The grandfather of Dr. Guillaume had therefore all the works of Voltaire, Rousseau, Diderot,

and the rest, and the children learned to read these books and many ideas took root. Certainly they influenced the thought of this young boy who went away to Basel to study and become a physician. He began his practice in Neuchatel and among his patients was a friend of Agassiz, Mr. Desor, who had received from America among other books some of the writings of Theodore Parker. Later Parker himself came to Europe and Dr. Guillaume met him and they talked of the abolition of slavery and other serious topics. Through him Dr. Guillaume learned to know the writings of Channing and other Unitarians.

For twenty years Dr. Guillaume was the prison physician in Neuchatel and when Dr. Wines went there in 1871 to see about organizing an international prison congress they became friends. As Dr. Guillaume was chairman of the Swiss Prison Society the Federal Council naturally sent him to London to attend the first International Prison Congress. There he met Mary Carpenter and spent several weeks in her home in Bristol becoming acquainted also with Octavia Hill, her sister, and their distinguished father Recorder Hill of Birmingham.

For years he was a member of the Swiss statistical society and in 1889 the Swiss Federal Council asked him to become director of the Bureau of Statistics, a position he still holds. He reached a wider public than Switzerland in one of his reforms. This was as president of the school board, a post he filled for years. Through an American engineer he heard of the idea of separate desks for each scholar, a plan which appealed to him as a physician. He wrote a little treatise on school hygiene and suggested this reform. The book was translated into all the languages of Europe and to Dr. Guillaume the little children of those great countries owe the fact that school desks and seats are adapted to their needs.

His own university, Berne, made him a doctor of laws and last year, during its great celebration, the University of Geneva made him a doctor of letters on account of his historical writings. I was present in Paris when Dr. Henderson told him of this new honor. He had heard the name announced in Geneva. Dr. Guillaume could hardly believe it. His learning is equalled only by his modesty.

The congress honored itself by making him an honorary president henceforth. He will finish the official report of this congress and then lay down his pen. But that will give him more time for his friends, of whom he has an unending throng. One has but to walk the streets of Berne with him to see how he is loved and revered. The little children know that kind face and gentle word and their fathers and mothers look pleased and proud when he recognizes them. In spite of his years—he is nearly eighty-three—no one thinks of him as old. He uses no glasses, no cane, no stimulants, and is as keenly alive to all reform and progress as any younger man. Loyal in his affection to his friends, true to the highest ideals of duty, his is one of the noblest and most beautiful characters it has ever been our joy to meet. A safe voyage to him as he sails over the seas and a calm and peaceful harbor!

AN EXCURSION INTO REFORMATORY AMERICA[1]

J. SIMON VAN DER AA

UNIVERSITY OF GRONINGEN, HOLLAND

Surely the trip through different states to visit various penological institutions—and including the visits to others before and afterwards—was the most interesting part of the Washington Prison Congress to the foreign members. It gave us a great many strong and valuable impressions about the country in general and its activity in the matter of prevention and punishment of crime in particular. But for this very reason, it is difficult to express at this moment and in brief, as I am asked to do, a general view about it. One must stand a little farther off to overlook the whole more freely. Time is needed to select and put in order material of such quantity, quality and variety. So, the only thing I can do at present is to make some scattered observations on points which seem prominent to me at this moment.

SIMON VAN DER AA, HOLLAND.

Professor, University of Groningen, who, on Dr. Guillaume's retirement, was elected secretary of the International Prison Commission. Professor Dr. van der Aa was chairman of the section on prison administration of the Washington congress.

There is no doubt that the trip was a complete success and that it an-

[1] Dr. van der Aa was one of the group of foreign penologists who were guests of the United States on the tour of American institutions which preceded the Washington Prison Congress. The itinerary included the New York State Reformatory at Elmira, founded in 1876, and the first institution of the kind in the world; the George Junior Republic at Freeville, the initial children's institution for juvenile delinquents founded along self-government lines; the New York State Prison at Auburn, the State Agricultural and Industrial School at Industry, one of the best examples of cottage institutions in America; the Ohio State Reformatory at Mansfield, one of the newer American reformatories; the Juvenile Court, Chicago, the first children's court in the United States and in the world, together with the following Illinois state institutions—The House of Correction and Juvenile Training School for Boys, the Illinois State Penitentiary at Joliet, Illinois State Training School for Girls at Geneva, the School for Boys at St. Charles, and the Illinois State Reformatory at Pontiac. In Indiana, an equally notable series of institutions was visited, including the Indiana Woman's Prison, the Indiana Girls' School, Indiana Boys' School (both for juvenile delinquents and indicating even in their titles the newer conceptions in such work), the Indiana State Prison at Michigan City, and the Indiana Reformatory at Jeffersonville, which has taken the leadership in experimentation in the direction of sexualization as a preventive agent. Special entertainment was accorded the delegates at New York, Auburn, Buffalo, Chicago, Indianapolis, Louisville, Washington and elsewhere. Visits were made to the institutions of the District of Columbia and, after the congress, to the Eastern Penitentiary at Philadelphia, the model in its day of cellular confinement, as Auburn was, once, for imprisonment in common with isolation at night; the two distinct types which, even in Europe, have been known by these American names. Prof. van der Aa was requested by the editors of THE SURVEY to express himself with entire frankness as to American institutions. The time at his disposal before sailing for Europe, was so very brief that he protested very naturally against putting his impressions on paper in such hurried form. To his good nature in overcoming these scruples, as guest and as literary man, Americans are indebted for what is, in truth, a valuable piece of constructive criticism.

swered perfectly its purpose. "A hard labor sentence," one of the foreign delegates called it jestingly, in an after dinner speech. If one take the term "hard labor" in a modern sense, as an instructive and educative exertion of mind and body after a well considered scheme and under clever and benevolent guidance, that denomination may suit perfectly. There is also this particular likeness: no other element of penological treatment is more beneficial than well conducted labor, and no way of introducing the team of foreigners into the theory and the practice of the American systems could be more profitable than that of letting them work through the program of the excursion with the pleasant help of competent Americans of both sexes. Gratitude to those who in one way or another contributed to make that work in so high a degree interesting and agreeable, as it proved to be, is one of the warmest and most enduring personal feelings we take home with us.

When the International Prison Commission in the meeting at Budapest in 1905, received the gracious invitation of President Roosevelt to hold the next congress in the United States, it gladly voted to do so. We presumed then that it might be right to go over to America for a change and that it could be useful to look at penitentiary methods and matters there. It was rational, all know now, not to say necessary, to do so for our own intellectual benefit and for the development of penitentiary science in general. Hardly any of us had been here before; nearly all were "freshmen" in that respect. Going about, seeing and hearing have not only added to the positive knowledge we possess, but have changed its character more or less; in a certain way cleared it, improved it and especially broadened it. Veterans, as many of us are in penological work, acquainted with what is done in Europe, we felt now and then like recruits when we stood before some new institution, some new proceeding that embodies or realizes some new keen idea; the warm enthusiasm of younger days now and then seized us, profound admiration several times animated us, even though the system and its incorporation, which awakened these feelings, could not perhaps be transferred to our own surroundings. Yet many a principle which forms the pith of such a system is apt in itself to be transferred, and to find its way sooner or later to other countries, I am sure, shaped according to local conditions.

Perhaps the most remarkable fact revealed to us was that the notion of the vindictive character of penalty appears to have quite vanished and that even the idea of retributive punishment seems here to be losing its hold more and more. Official and unofficial words of the highest officers of state bore witness to this advanced state of mind, as it seemed to me.

Next, I was struck particularly by the probation work and the parole practice, these two equally important methods of dealing with transgressors. To avoid punishment, if possible, and especially to keep the person out of prison; to release him, if he is sent to prison, as soon as feasible, are undoubtedly sound and excellent ideas. One can hardly sufficiently appreciate that they are not carried out by the direct action of authorities merely, but that private associations and individuals co-operate with the judicial and executive powers in such a way and to such an extent as were evident to us. Thus public sentiment is created, which is indispensable for the success of such methods. In this America is certainly far ahead of old Europe.

Very high it ranks too,—standing in line with the most progressive countries —in the work, official and private, of saving children from crime and distress. It was a treat to sit at the sessions of juvenile courts, where the judges in dealing with the various cases showed as much simple kindness as clear sagacity. Whether these sessions should be open to the public, in the absolute way they seem to be, is to me a matter of serious doubt. It was a pleasure to see different institutions: — friendly children's homes, the homely detention house, and the well kept reformatory institution for boys and girls in Louisville; the renowned Geneva and St. Charles Schools near Chicago, and the special division for

boys in the house of correction there, held quite as an educational institution, with first class manual training;—the imposing new reformatory for girls outside Indianapolis, built after the cottage system on large and beautiful grounds; the fine and home-like reformatory of Industry, a collection of family cottages and other buildings covering a vast and pretty domain in the country near Rochester, N. Y. The hasty visit of less than an hour to the George Junior Republic at Freeville did not allow any closer observation of that remarkable experiment to let children be ruled by children under general supervision. A pleasant and favorable remembrance of that peculiar self-governing community remains, giving at the same time the impression that the inmates must be always of a certain standing, which excludes very bad and otherwise unfit elements, and also that the supervisor must possess uncommon personal qualities.

The latter criticism may be applied also to the big reformatories or reformatory prisons for juveniles and adults, like those of Elmira and Mansfield, where we had the advantage of again seeing a system till now unknown in practice in Europe. Therefore, the visits to these institutions were counted amongst the most interesting events of the trip and they did not fail to impress their characteristic features on the minds of the visitors. The situation of each on an elevation, the extensive premises, the grand structures, luxurious even in some points, as they seemed to us, spoke of the importance attached to the reformation of young criminals who might be rescued from a life of vice and harm and turned into orderly and valuable members of society. Not to let them undergo punishment, but to make them good citizens if possible, seemed to be the design that rules—and rules entirely—the treatment. So we found it in both institutions but with some difference in details. It would, for instance, appear that Elmira did a deal more in the line of work in the gymnasium and military drill, which we saw performed in an astoundingly alert and correct manner, and that Mansfield put more weight on instructive labor and teaching a trade, of which we saw remarkably good results.

In these reformatories, containing a thousand and more inmates each, a great deal must depend on the influence of the general spirit of the house. This spirit has to seize the individual man and lead him in the desired direction. Does this not imply the danger of weakening his individuality, which should be at its strongest on his return into free life? I was informed that experience shows it does not, and I am inclined to think, judging from what I could observe and gather outside the prisons, that indeed, generally speaking, the American knows how to submit to common rules and at the same time to keep up his individuality. It follows that individualization is not considered the great modern principle in confinement, as it has been in later years in Europe. Still its value is not quite overlooked in these reformatories. For the men who live for the rest of the time in common are kept in cells from the hour that work is over till the next morning and likewise on Sundays. This, it seems, is a weak point in these institutions, in consequence of the construction; the cells can hardly be called sufficient for their purpose, at least not according to our general standard. First of all they are inside cells, receiving light and air not directly from the outside, but only from the corridors round and between the tiers. Besides they are of small dimension, too small in fact for serving as a convenient retreat during many hours. Moreover, when the house is overcrowded, which often is the case two or more persons are put in one cell. It seems that the relatively small amount of additional money needed for the construction of a sufficient number of cells of larger dimension, with direct admission of light and air, could be easily raised when one thinks of the large sums which these institutions must have cost.

This same drawback is found in other prisons, even in the famous old penitentiaries at Philadelphia and Auburn. Everyone who has studied the history of prisons has visited these with a feeling of respect for their past, but at the same time with a feeling of regret for the

present in that respect. The Eastern Penitentiary at Philadelphia, once the model for cellular imprisonment, is now holding far more prisoners than its capacity allows, so that even four men are kept in a cell which would be sufficient for just one. At Auburn, the model once for imprisonment in common, with isolation at night, many a cell held more than one person, a deviation from the good old regulation. There at Auburn the special division for women (formerly a hospital for insane) shows how cells should be constructed according to modern conceptions. The new cell block in the house of correction at Chicago shows the same advantage.

Far worse is the drawback in houses for prisoners awaiting trial or serving short sentences, like the Tombs of New York and different county jails we saw. In the latter, sometimes a barred corridor along these inside cells offered some opportunity of moving about, but it also imposed upon the prisoners the promiscuity of all the others in the same row. In these prisons there is, as a rule, no work for the men, so that they have to pass their day—and often many a day, many a week, many a month—in idleness, trying somehow to kill the time, and everyone who knows prisons understands what that means.

Labor, in fact, is the best thing one can offer the prisoner. The man detained for trial will also accept it as a benefit, or can be made to understand that it is such. America is a land where one evidently knows what it is to work and what work means to a man. Is it not astonishing, then, that there should be difficulty in providing it for prisoners, either because of the construction, or the management, or for other reasons, like fear of competition with free industry? This competition which seems to be a great hindrance in several states, as we heard, can be eliminated or reduced to an absolutely harmless minimum by a discriminate application of the state-use system, adopted already in many of the prisons here. Such is the experience in my own country, where the damage would be all the greater as the country is small. How well Americans know how to make prisoners work we have seen in the penitentiary at Blackwell's Island and elsewhere; how well they know how to teach them trades we have observed in the prison at Auburn and in other institutions, when no restrictive regulation put obstacles in the way.

To conclude, I must mention that the visit to the great reformatory at Jeffersonville deeply impressed us as it brought us face to face with a daring attempt at solving one difficult problem of prevention (sterilization), which gave cause to much after-thought and discussion.

Let me say in addition that we greatly admired the American frankness and broad-mindedness which allowed and induced us to see everything, even where the authorities who opened the doors knew that we would find fault. This has obliged us in our intercourse with our American colleagues and friends not to speak only flattering words, but to express our thoughts when we were asked to do so, freely and openly, and this, I am glad to say, has facilitated greatly mutual understanding and increased yet more our sympathy with them, their work and their country. For this reason I felt bound to refer to those few drawbacks while expressing warm appreciation of the great work in general which is done here in practical penology, as revealed to us in the trip.

SOCIAL CHANGE AND PRISON REFORM IN JAPAN

T. SANAGI

COMMISSIONER OF THE PRISON BUREAU, DEPARTMENT OF JUSTICE, JAPAN

With regard to the improvement of prisons in the Japanese Empire, every effort has been made to adopt measures to that end during the last forty-two years, that is, ever since the accession of the present emperor. In 1872 the principle and course to be adopted in the treatment of prisoners were for the first time defined; and at the same time the essential point of prison government was indicated in the following terms:

TAKASHI SANAGI, JAPAN.

Commissioner, Prison Bureau, Department of Justice. Mr. Sanagi was one of the public lecturers at the Washington congress.

> The prison should be a place for the treatment of men with humanity and not with cruelty; it should be a place for correcting them, and not for inflicting pain upon them. Punishment is resorted to under unavoidable circumstances when the object is to remove evils from the state. Prison governors should bear this carefully in mind in the treatment of their prisoners.

The intention was thus clearly expressed to put an end to cruelty and infliction of pain in the treatment of prisoners, and to adopt exclusively what is known as the principle of improvement and reform based upon the doctrine of humane correction. Since then, by observance of this principle, efforts have been made to reform the prison system and to bring about improvements in the enforcement of penalties to keep pace with the reform and development of the penal system. Three years ago, in 1907, the criminal code was revised, and with a view to insure the effective enforcement of penalties, the prison law was also established and promulgated. In this manner a new era was opened in the penal administration of our empire.

The social changes have been remarkable in our country. From institutions and social conditions and manners to arts and sciences, there is nothing that has not undergone entire transformation. When we look back to the times, more than two decades ago, when the criminal law and the prison regulations which were in force up to the year before last were first established, we feel as if we were then living in an altogether different world. Now law is the reflex of society; and it need hardly be stated that

since it is the true character of law to develop simultaneously with institutions and social conditions and to advance with the progress of science and acquirement of experience, it should always keep abreast of the times. And when regarded also from the standpoint of penal administration, the necessity for the revision of the criminal code was recognized. Accordingly, after careful study of the sciences and institutions of the various countries of Europe and America, and mature consideration of the social conditions of our country and the results of our scientific knowledge and experience, additions and amendments were made upon subjective principles and the criminal code revision bill was drafted. It was presented to the Imperial Diet and, with its approval, was promulgated in July, 1907, and brought into force on October 1 of the following year. Thus, the criminal code was revised, but since the effectiveness of a penalty is revealed only when it is enforced, no judicial decision, however just and to the point, can be of effect unless it is carried out in a proper manner. Hence, it became more necessary than ever to bring about a reform in prison administration, and the prison regulations, which had been issued in the form of administrative regulations, were abolished. As it was deemed necessary to enact a law in their place in order to strengthen the basis of the enforcement of penalties, the prison law was framed in accordance with the principles of the revised criminal code. It was presented to the Imperial Diet in 1908 and, upon obtaining approval, was immediately promulgated. It was brought into force on October 1 of the same year, simultaneously with the revised criminal code. The detailed regulations relative to its enforcement were, so far as they harmonized with the spirit and principles of the prison law, issued at the same time in the form of an administrative ordinance, that is to say, in this case as an ordinance of the Department of Justice. In this manner, penalties and their enforcement were made to harmonize with each other; and this harmony has been of great service in the penal administration of the empire.

With regard to the results of the enforcement of the revised criminal code and the prison law, it would be premature to speak with confidence as the enforcement is still of a recent date; but if we were to compare the number of persons convicted during the twelvemonth following the introduction of the revised criminal code with the number during the same period immediately preceding that event, we should find a decided decrease. The revised code has generally extended the range of penalties and left room to reach the proper mean between severity and leniency, by letting the degree of punishment vary with the circumstances of the offence and the character of the offender. As persons who have previously transgressed the law are in most cases condemned to longer terms of imprisonment than was the rule under the old code, those with previous convictions are struck with fear and not a few habitual offenders have taken up honest callings. The decrease in cases of gambling and larceny is an instance in point, and goes far to show that the deterrent effect of punishment is recognized and that its object, the general prevention of crime, has been attained. Further, many prisoners, fearing that if they commit crimes after leaving prison they will be condemned to long terms of imprisonment, become careful in their conduct and make up their minds to take up honest callings when they are released. Moreover, whereas in the old code it was prescribed that to be admitted to the special favor of provisional release those condemned to penal servitude for life must serve fifteen years, and those condemned to a definite term must serve two-thirds of that term, under the new code provisional release may be granted after ten years in the case of servitude for life, and in the case of penalty for a definite term, upon the lapse of one-third of such term. As this special favor may thus be enjoyed much sooner than formerly, the prisoners, in their eagerness to qualify as soon as possible for this favor, have shown a tendency almost unconsciously to become careful in their conduct. The adoption of the finger-print method for the detection of previous conviction, the consequence of

which is to eliminate the blind trust that a light sentence might be obtained by concealment, has not been without fruit in the prevention of crime. Among the reforms made in the prison law with a view to the effective enforcement of penalties, should be mentioned the fact that the wages for the work done by prisoners, which they received under the old regulations as a matter of right, are now given them in the form of rewards, and in the conditions for determining the rates to be given, conduct has been included. This intimate connection between their conduct and the amount of their rewards has produced a good impression upon the prisoners and brought about an improvement in their conduct. As a part or the whole of a reward may, according to circumstances, be withheld under the new law as punishment, the prisoners have naturally shown a disposition to be careful and diligent. In short, as they have come to understand that their punishment is not to be slighted, and its enforcement not to be evaded, the condition of the prisoners has changed and is now tranquil. It would not, therefore, be far from the truth to say that the enforcement of the revised criminal code and the prison law marks an advance in our prison administration, and that its object has been attained in part.

But it need hardly be stated that since laws and regulations are lifeless things, they will be of no effect unless there are proper men to put them to practical use. As it was necessary to foster men of character at the same time as the revision of laws and regulations, the training school for prison officials, which had been closed for some time, was re-opened in Tokyo upon the enforcement of the criminal code and the prison law. Once or twice every year one or two of the chief jailers in actual service are selected from every prison and admitted into the school, where during four months they receive instruction in law and other subjects useful to prison officials. Thus, the school is the means of obtaining men of special fitness for the work. Since last year two terms have passed and 117 persons have completed the course. As the school has so far given effective results, it is intended to keep it up.

It is not enough for the improvement of prison administration to obtain proper prison officials; a great deal depends without doubt upon the buildings. The prisons hitherto erected in our country are mostly of wood, and the arrangement and construction are imperfect so that it is to be feared that perfect confinement and true reform cannot be confidently expected in such places. Rebuilding of prisons was perforce recognized to be as urgent as reform in administration. Accordingly, in 1900, it was decided that prison expenses, which had until then been defrayed out of the local accounts, should thereafter be defrayed out of the national treasury. At the same time, a program was formed with respect to the reconstruction, and after a careful consideration of prison architecture in Europe and America, and close study of the actual convenience and advantages attached to it, it was planned to build our prisons entirely of brick or stone. The scheme was adopted of rebuilding one after another at the annual expenditure of 300,000 yen. First, the rebuilding of six prisons was commenced as an undertaking extending over five years. Those belonging to the first period have been completed, and the rebuilding of four prisons which belong to the second period has been commenced. The work is going on and will, it is expected, be completed in a year or two. In order to make the reconstruction as complete as possible, it is desired to rebuild the remaining prisons, and application has been made for funds to meet the cost. Although the object in view is, for financial reasons, yet unattained, a plan is being made to apply for an annual grant of not more than 500,000 yen, and to expedite therewith the rebuilding of the prisons of the whole country.

As regards prison education, lessons are daily given to prisoners under eighteen years of age, while to those of eighteen years and upwards, the lessons are given only in cases where they are deemed necessary. The subjects taught are those of the primary school course. In large prisons professional teachers are

specially engaged, but in small ones the chaplains take charge of the classes in addition to their proper work. Moral instruction is based entirely upon religion, and the chaplains are all Buddhist priests.

As the provisional release previously referred to has had a marked effect upon the condition of the prisoners, it is here proposed to give some details of the procedure connected therewith. If any prisoner, who has been of good conduct and received reward-badges and has been in prison for ten years under a life sentence, or for one-third of the time condemned to a definite term, is considered by the governor of the prison to show unmistakable signs of repentance and reform and to be fit to be provisionally released, the governor reports to that effect to the minister of justice. If the minister approves, he gives the required permission. When such prisoner leaves the prison, he receives from the governor a certificate of provisional release, and after release he must, of course, take up an honest calling, maintain his good conduct and be under the control of a police office. The police office, however, may, after hearing the opinion of the prison governor on the matter, delegate the control to a private individual, who must be a competent relative or friend of the prisoner, a person engaged in protecting discharged prisoners, a priest, a schoolteacher, or a person of high moral reputation. If a prisoner on provisional release desires to change his residence or to travel for ten days or more, he must obtain permission of the controlling police office, and if he desires to travel outside the Japanese dominion, he must obtain permission of the minister of justice. Further, he must present himself without fail once a month at the controlling police office, and report on his occupation and other matters connected with his livelihood. If he commits a crime and is condemned during the period of provisional release; if he is condemned to a major fine or a more severe penalty for an offence committed prior to the provisional release; then, in the case of one who has been condemned to a major fine or a more severe penalty for an offence committed prior to the provisional release, such penalty is to be enforced; or, if he has violated any provisions of the regulations relating to provisional release, the minister of justice may, upon receiving the report of the public procurator or the prisoner governor, revoke the order for provisional release. The number of prisoners provisionally released during the last five years (1905-9) is 8,281, while the number of those whose provisional release was rescinded during the same period is 264. The provisional release system has on the whole given good results and has been effective in bringing about the reform of prisoners so released. Although there is no fixed rule respecting the protection of the prisoners upon their provisional release, to those for whom such care is necessary suitable attention is given by societies for the protection of discharged prisoners, charitable persons, or persons to whom their control has been delegated.

A remark may be made, in conclusion, regarding the work of protecting discharged prisoners. With a view to the development of this work, the government has annually been distributing 10,000 yen among the protection societies of the country and has made every effort to stimulate and encourage the establishment of societies; but the object aimed at has not yet been completely attained. The present number of societies for the protection of discharged prisoners throughout the country is fifty-seven; but it is much to be regretted that they are organized on a small scale and that their field is consequently limited. It is, however, now recognized by both the government and the people that the protection work should not be neglected. As the present tendency of society proves the urgency of this work, we are not without hope that with its steady progress, we shall fully attain in the near future the object we have in view.

THE COMMON WELFARE

A MUNICIPAL YEAR BOOK

Years ago, in his book on The American Commonwealth, Ambassador Bryce pointed out that the weak link in our administrative system is municipal government. It goes without saying that one method of giving it temper and tensile strength is to secure and make available exact data as to municipal affairs, which will be at once comprehensive and comparable, one city with another. Yet, although there have been improvements in administrative methods in many cities of late years, we still lack the machinery by which municipal officials and citizens in New York or Cleveland or Los Angeles can quickly and accurately learn how other cities are doing any branch of civic business and what the results are.

THE POPULAR CANDIDATE.

G. O. P. to Dem.—I don't know who this V. N. is, but she's getting all the votes today.—*Minneapolis Journal.*

V. N. was the visiting nurse fund of the Minneapolis Associated Charities which raised money by a successful tag day.

In only lesser degree this was true also of the German cities, before their present period of municipal renascence, which has been accompanied by a corresponding development in the technique of municipal bookkeeping. Among the working influences which have led to effective interchange of information and method have been the publications of Albert Sudekum, one of the South German group of socialists in the Reichstag, who is in America for a period of weeks lecturing before various civic and scientific bodies. The program of these German radicals, who are the moderate wing of the Socialist Party in the empire, is not altogether different in spirit and issues from the political platforms of the Western insurgents, or the civic demands of aggressive civic organizations in this country. It will be recalled that Dr. Hegemann, who was a member of the staff which organized the Boston-1915 exposition of 1909, later instituted a similar civic exhibit in Berlin. This was transferred to Düsseldorf. While it was there, Dr. Sudekum was called in by the municipal government as an expert on city planning — and shortly after his arrival in this country, he received a similar invitation to speak before the Municipal Congestion Commission of New York.

It is his experience in the technique of municipal administration, coupled with his intimate acquaintance with the practical working-out of various progressive policies adopted by the different continental cities, which will make his American lectures especially informing to civic bodies in the United States. But

ALBERT SUDEKUM.

Who edits a year book of German municipalities much needed in America.

his editorial work itself holds a special significance for the country at large. He conducts a critical weekly journal devoted to municipal affairs, entitled *Kommunale Praxis,* of which we have no counterpart in this country. We have, to be sure, a number of papers concerning municipal matters published by city governments and local organizations, which prove that critical interest in the details of civic affairs is spreading. The labors of the various bureaus of municipal research and of such official bodies as the Merriam Commission in Chicago and the Finance Commission in Boston have created a body of material, but it is in the nature of disconnected publications. The national bureau of municipal research which is so badly needed could well devote part of its energy to issuing such a magazine of municipal technique.

The *Kommunale Praxis* was so successful that its editor issued, through Gustav Fischer of Jena, the even more valuable *Kommunales Jahrbuch* (Municipal Year Book). This consists of two volumes of 800 pages each. In Part I public health, street cleaning, charities, water and gas supply, town planning and the like are treated in carefully prepared articles. The material is arranged alphabetically by subjects and the new work in each field in every city in Germany is noted. There are a number of valuable statistical tables which show, to take gas production as an example, the amount produced in each of the larger cities, the total cost and gross revenue, the cost and selling price per unit of measure, the profit to the city and other facts by which the practical efficiency of operation in different towns can be judged and compared. This is similar to the statistical work of the Wisconsin Public Utilities Commission.

In Part II, the cities are arranged alphabetically, and pertinent facts are printed as to the municipal ordinances, organization and activities of each. The only publication in English to compare with these volumes is the Statesman's Year Book, which, however, is devoted to information about national governments and has no portion grouping the facts by subjects as well as by countries.

The Book of American Municipalities issued by the National Municipal League is in an entirely different class from this encyclopaedic German Yearbook.

COMMON DENOMINATORS OF MUNICIPAL GOVERNMENT

The *Jahrbuch* is entirely self-supporting and enjoys no subsidy. It is the output of two men and two stenographers and has a sale exceeding 2,000 copies mainly among city officials. The material is collected through voluntary answers from the cities through their boards of statistics or mayors. Some sixty carefully prepared questionnaire blanks are sent out and where there is any question as to the accuracy of the returns, a special investigation is made.

The compilation of such a year book is made possible by the work of boards of statistics in all the larger German cities. These, after years of effort, have reduced their municipal statistics to common terms and made it possible to secure figures that are prepared in the same way and are fairly comparable. New York has, in the comptroller's office, a bureau of statistics and investigation and a few other cities, as Philadelphia, have statisticians attached to the mayor's office. Ordinarily, however, each city department makes up its own statistics and, save perhaps in preparing its budget estimate, receives practically no instructions calculated to secure uniformity within the city or with other towns.

Ex-comptroller Herman Metz of New York, while a city official, felt the need of some agency from which he could learn how certain things were done in other places and the results. He has since made a gift to establish a central bureau for collecting such data and making it available to officials throughout the country. Perhaps the most valuable feature of this agency will be its influence toward uniform statistics. The publications of the Census Office upon municipal statistics are not of the specific character of the *Kommunales Jahrbuch*, and the office is itself much hampered by the lack of uniformity referred to and is obliged to keep a large corps of agents in the field to overcome the difficulty.

To Dr. Sudekum's mind it would be impossible as yet to publish an American year book of the standard of the German volumes, because of the inequalities and fragmentary character of the information to be obtained. Perhaps, however, that is merely another argument for its publication; the very gaps serving to show residents of different cities where their home governments are not keeping tab in an understandable manner. As a leverage for bringing out facts which like to be hid, and as a compendium of statistics, the German volumes seem remarkable instruments of education. The presence of their editor in this country, in the words of a New England civic leader, puts the query rather pertinently to Americans, as to where we shall look for such an American municipal year book. Will it be, he asks, from the presses of one of the great universities, from a National Bureau of Research, from the Russell Sage Foundation, or from the Census Office?

THE STRIKE OF THE EXPRESSMEN

The strike on October 25 of the wagon helpers of the United States Express Company in Jersey City and New York, followed within a few days by their drivers and now extending to some 6,000 men employed by the four large and many of the smaller express companies and some department stores, is a protest against present wages and hours. The wage demand which the Teamsters' Union makes is for an increase of five dollars a month as follows:

	Present Wages.	Wages Asked.
Route drivers	$75	$80
Chauffeurs	75	80
Transfer and schedule men	65	70
Single wagon drivers	60	65
First helpers	50	55
All other helpers	17-45	50

It is noteworthy that except in the first three grades, none of these wages, even with the proposed increase, is adequate to provide a normal living according to Chapin and other recent reports on standard of living.

If the strikers win, the helpers will secure the greatest advantage in the mat-

ter of wages, though their scale is the lowest. It has been the custom of some of the companies to hire boys of eighteen at wages ranging from seventeen to forty dollars a month to do men's heavy work. The proposed establishment of a minimum of fifty dollars should tend to displace growing boys in favor of strong men.

There has hitherto been no system of advancement in wages, the vast majority of the men working for years for the same salary, and the strikers' demands contain a clause which would be the first step toward a system of promotion based on seniority of service.

The hours demanded are eleven, with pay for all overtime beyond the first half hour, which is "given to the boss," and time and a half pay for Sundays and holidays. Eleven hours is not a short work day but it represents a great improvement over the present conditions—about fifteen hours a day, Sunday work once a month and work on holidays on demand without pay. At present, as the men put it, "there is a regular hour for starting work but none for stopping." From seven in the morning till six at night is the time for collecting packages; at six the load is delivered at a railroad station, unloaded by driver, helper and platform man and the wagon reloaded with a "bulk load" waiting on the platform. This is carted to another railroad station, sometimes all the way from the Grand Central to Jersey City, unloaded again and the wagon taken to the stable. Not till then is the expressman's long day over.

At the time of going to press, all efforts at settlement by Mayor Gaynor, John Mitchell, the State Board of Arbitration and the Merchants' Association, have failed. The men have been willing to arbitrate on all points except one—the right of the companies to discharge men, or to refuse to re-employ them, because they have joined the union. So conservative a body as the Merchants' Association has condemned this attitude in measured and convincing terms.

A comparison of the wages and hours of these expressmen with those of post office employes, men of similar grade doing work requiring a like degree of intelligence, shows clerks and letter carriers working an eight-hour day, against the proposed minimum of eleven for the expressmen. For the first three years of probation after passing the civil service test, post office wages average $32 a month. In regular service, they begin at $600, rising to $800 the second year, with a yearly increase of $100 thereafter until $1,100 is reached. About fifty per cent of the men who have been on the regular force for six years are raised to $1,200 by special appropriation by Congress. A clerk or letter carrier must therefore work over five years to reach the present salary—a little under $800—of an express transfer man. This, however, is a shorter time than the average expressman must wait to become a transfer man—in fact, many of the helpers never rise beyond the tailboard of the wagons—and the letter carrier has a fixed period of probation with a regular wage increase from year to year to look forward to. There is the additional incentive of a pension or retiring scheme of some sort for which government employes are now working.

It is noteworthy that one class of postal servants has no protection from the civil service and ranks with the express helpers, should the latter secure the new schedule. In this class are drivers of mail wagons who are employed by private companies which hold government contracts for hauling mail. Up to five years ago, in New York, these men received a dollar a day for fifteen hours' work. In 1905 they struck, were received into the Teamsters' Union—the same union which has just taken in the unorganized expressmen—and, thanks to its support, were increased to two dollars for an eleven-hour day.

EMPLOYMENT EXCHANGE REPORTS ON FIRST YEAR

The National Employment Exchange, which was organized in New York with a guarantee fund of $100,000 to carry it over the initial years on a semi-philan-

thropic basis, has issued its first annual report. An inroad of $10,622.09 has been made on the guarantee fund, but the net earnings of $14,170.05 are encouraging, particularly in view of the fact that the prime object of the exchange is to place men at work. Commercial bureaus, it has frequently been shown, too largely pursue a successful policy of securing fees rather than jobs.

The exchange has two offices for skilled and unskilled laborers, at 14 State street and 211 Grand street, and a newer office for both men and women in mercantile lines, at 47 West Forty-second street. Up to September 30, places were found for 4,120 men as laborers and 537 situations for applicants at the mercantile bureau. It has interpreters who speak seventeen languages.

Orders for skilled and unskilled laborers were received in abundance, but it was found that a large army of idle men will not accept work when it is offered. The requests for men so far exceeded the number the exchange was able to furnish as to indicate that times are prosperous and few able to work have any excuse for idleness.

Some of the men placed, especially if they did not pay for at least part of their transportation, deserted upon arriving at the destination. Often there were good reasons, such as exorbitant prices for food and poor sleeping quarters, but many had no intention of working. The exchange finds that it is difficult to secure men willing to take places in the country or on farms. Applications for positions as clerks are accepted only from persons within commuting distance of New York. So many of this class are out of employment that the salaries paid for the lower positions are less than in the trades. This, the report holds, is because people come from all over the country who will work for small pay to have something to do, and the workers in New York must take less for their labor than they should.

In his report as president, Otto T. Bannard points out that self-support was not expected of the bureau for the first few years. "It was agreed that fees should be charged with the hope that the exchange would become self-supporting before the fund was exhausted, and because a business rather than a charity would attract a better class of both employers and employes."

The contributors to the guarantee fund include men connected with most of the largest charitable organizations in New York.

ENGLISH TRADE UNIONISTS REPUDIATE CONCILIATION

The London *Times* reports that the women chainmakers of Cradley Heath, whose strike was described in THE SURVEY for October 1, have come to an agreement with the manufacturers' association. The latter voted unanimously to deal with no contractor whose name was not on the women's "white list" of those paying the new scale of wages. One class of women workers in England is thus on a firmer basis than ever before, not only because of a higher scale of pay but because it has learned the lesson of the value of organization.

In the meantime, important developments are taking place throughout the labor movement in England. The rank and file of the union membership in three trades have struck, against the advice of their conservative leaders, and have virtually repudiated the conciliation and arbitration system that since 1902 has been called in to avert strikes.

The railway men, whose threat of strike in September was caused by a reduction of wages, at their last general meeting in October passed a resolution against the whole arbitration and long-term agreement system, on the ground that the system made it practically impossible to readjust grievances without long delay or to take advantage of improvements in the industry which might make increased wages possible.

In September, too, the miners of the Ely Pit struck on account of a reduction of wages which they claimed the conciliation boards had already had eighteen months to adjust, and a little later the boilermakers struck for a similar grievance for which they had asked re-

CHAINMAKER AT THE FORGE.

The English women in this trade, mostly mothers of families, work twelve hours a day at crude forges in their own homes.

dress in September, 1909. Aside from the annoyance of such long delays, the question of prompt adjustments of the wage scale is of the greatest practical importance to the miners, as the decisions of the arbitration boards are not retroactive.

In the cotton industry the employes of a single mill went out because of the dismissal of one man, who, by advice of the union, had refused to do work which was not on the list of the operatives' duties in the agreement between employers and employed, but which employers in many mills had been in the habit of exacting from their men.

The cotton, boiler and mining employers responded by a general lockout involving altogether probably 200,000 people. They claimed violation of the long-term contracts, and held that the men should have waited before striking until the whole machinery of arbitration had been brought to bear on their grievances.

In the cotton trade a temporary adjustment has been reached and arbitration is now under way. In the mines and shipyards the union officials have been powerless to make the men see the situation as a violation of contract, and according to the last reports these trades have not yet adjusted their grievances.

It is not without some show of truth that the London *Times* recognizes a very revolutionary element in this repudiation of the union leaders, and suggests that the same attitude of mind is extending to political leaders also, and the English

labor movement is taking the first steps toward that policy of "direct action" in the economic field that is becoming a prominent feature of the French labor movement.

AMBITIOUS PROGRAM TO HELP ITALIANS

A comprehensive and exceedingly ambitious program to benefit 750,000 Italians in New York city in embodied in the plans which the Contessa Lisi Cipriani is fostering as the representative in this country of the *Segretariato Permanente Femminile per la Tutela delle Donne e dei Fanciulli Italiani all' Estero.* This society is entrusted by the Italian government with the welfare of Italian women and children abroad.

A first step among those planned is the establishment of a central bureau to publish the results of research and to help bring about co-operation between all institutions which carry on work in behalf of Italian immigrants in New York. A bureau of translation and information is to be included to assist the needy in making proper application to local charities, and to aid workmen seeking employment.

A hygienic station has already been started by Dr. Louis R. Kaufman of the Flower Hospital which is to receive the co-operation of the Board of Health. The work of the station will be to instruct the people how to avoid disease by their own efforts, to treat working mothers and their children, to aid mothers before the birth of the child, to study rachitis and arrested development among Italian children, and to help in the campaign against tuberculosis. The Italian government has promised to furnish two physicians who are to publish medical sociological records.

The City and Suburban Home Company offers to raise one million dollars for model housing accommodations, provided Italians and their friends will find an equal sum. The intention is to build homes in the less congested districts. To supplement the model tenements, gymnasiums, reading rooms and lecture halls are planned.

CONTESSA LISI CIPRIANI.

Trade and industrial schools are contemplated, also, as the best means for improving the standard of living by increasing the number of skilled workmen in the rising generation. The Italian government has promised first class teachers for these schools.

These steps have all received the sanction of the Italian government. In addition plans for colonization are under consideration. The idea is to have farming villages and not to encourage the single Italian to take up land. The colonization plans have not yet been submitted for approval at Rome.

This all-inclusive plan smacks of the Utopian, but it is not expected that the entire scheme can be set in operation at once. To those who wonder how much dependence may be placed upon promises of help from the Italian government, it is pointed out that certain activities for the benefit of Italian immigrants in New York already receive financial

assistance from Rome, paid from the procceds of a tax of $1.60 collected from every person who leaves Italy. Of the amount raised, which is set aside for the benefit of emigrants, some is expended to aid those who have returned and much will be used to help the Italians in Argentine. Besides its direct value, the sanction of the Italian government will make it easier to get the co-operation of influential Italians here.

To ensure full success for the plans ample funds are needed. The names of those already interested are a reasonable guarantee of the worth of the scheme. The money will be forthcoming in the long run, provided the details are worked out carefully and capable agents are found to carry on the work. Among those who are patrons of the movement are:

Dr. Samuel McCune Lindsay, director of the School of Philanthropy; Dr. George W. Kirchwey, dean of the Law School, Columbia University; R. Fulton Cutting, president of the Association for the Improvement of the Poor; Hastings H. Hart, director of the Child Helping Department of the Russell Sage Foundation; Robert Erskine Ely, director of the League for Political Education; E. R. L. Gould, president of the City and Suburban Home Company; Owen R. Lovejoy, secretary of the National Child Labor Committee; John Mitchell, vice-president of the American Federation of Labor; Antonio Stella, vice-chairman of the Committee for the Prevention of Tuberculosis; Edward S. Sykes, director of the Technical Department of Teachers' College, University of Columbia; Benjamin C. Marsh, secretary of the City Commission on Congestion and Population; Rev. Professsor Besani, secretary of the *Italica Gens.*

THE PREVENTION OF INSANITY

At its annual meeting, held in Albany in February, 1909, the New York State Charities Aid Association took as its theme the Prevention of Public Dependence. Through several sessions it considered the possibility of specific measures aimed directly at diminishing the volume of demand upon public aid. In direct line with the suggestions advanced at that meeting, the association now announces, elsewhere in this issue, that it has entered upon a campaign for the prevention of insanity.

It has in hand the same agencies with which it began three years ago its tuberculosis campaign—a special committee, composed partly of experts and partly of interested citizens; a guaranteed income of several thousand dollars (which it hopes largely to increase) and a paid staff to give continuous attention to the movement. As in the tuberculosis campaign, the state department directly affected, the State Commission in Lunacy, is a leading factor from the outset.

It is fitting and is significant, that the State Charities Aid Association, which in the decade ending in 1890 secured the legislation for the humane care of the insane in state hospitals, should now go one step farther back and seek at least to hold in check the increase in the number of the insane, which is considerably in excess of the growth of population, and which must be recognized as one of the extremely serious facts in present social conditions.

The new work is not without its difficulties, but they are of a sort which people are more ready to overrate than otherwise. This movement rests on a solid basis of known scientific fact. It has the experience of the tuberculosis campaign to draw upon. If entered upon seriously and with plans proportionate to the magnitude of its objective, and with reasonable financial support, substantial and tangible results are within reach. The way to prevent is to prevent.

DO AND SAY

Two brothers once lived down this way,
And one was Do and one was Say.
If streets were dirty, taxes high,
Or schools too crowded, Say would cry,
"Lord, what a town!" but Brother Do
Would set to work to make things new.

And while Do worked, Say still would cry;
"He does it wrong! I know that I
Could do it right." So all the day
Was heard the clack of Brother Say.
But this one fact from none was hid:
Say always talked, Do always did.

(Frederic Almy, secretary of the Buffalo Charity Organization Society, in the *Christian Register*).

RECENT CONFERENCES

LONDON TOWN PLANNING CONFERENCE

CHARLES MULFORD ROBINSON,

"For each age is a dream that is dying,
Or one that is coming to birth."

These lines, which are at the end of a little poem—by Shaugnessy, is it not?—that hung somewhat obscurely in the Edinburgh room at the town planning exhibition in London, in October, are a fair expression of the feeling which one had in attending the remarkable town planning conference that closed there October 15. The conference was under the auspices of the Royal Institute of British Architects, with the king as patron and John Burns as honorary president. It brought together 1,500 delegates, the greater number, of course, from the British Isles, for the most part architects, city councillors and engineers, but many also from France, Germany, Italy, Holland, a few even from Australia and a half dozen from the United States. The number of the latter would doubtless have been considerably greater had the conference been held in the early summer, as was proposed until the sudden death of King Edward caused the change of many English plans.

The conference was formally opened on October 10 and it closed with a series of excursions to see town planning work on the fifteenth. The days intervening were filled to the brim with meetings, social functions, and town planning trips. Indeed, the most obvious criticism, if one were seeking to criticise, would be that so large a program was crowded into so short a time. In the afternoons one had to choose between two simultaneous meetings and a half dozen excursions, each feature promising great interest. And all the time three exhibitions, in far scattered places, were inviting the attention of the delegates.

The official program—merely the program—made a pamphlet twice the size of THE SURVEY. The excellent catalog of the town planning exhibition in the Royal Academy was the equivalent of another pamphlet as large again; the catalog of the exhibitions in the Guild Hall and at the institute would make a third; and still there are the social activities to tell of, such as the evening reception to the delegates at the institute; the reception by the lord mayor and his wife at the Mansion House; the banquet, with its many speeches, at the Hotel Cecil; the reception by the American ambassador, and the countless informal luncheons and dinners, which were to be expected when 1,500 delegates, of many nations, but all of one faith, one hope, one great interest, came together. And were all this told, a shelf-full would remain of books and pamphlets descriptive of the garden cities, the housing and other town planning work which the delegates visited in the eighteen conducted excursions offered for their choice.

Thus one cannot write in short space an adequate account of the conference. There was not even a set of resolutions, which might be quoted to sum up conclusions. The congress was really for conference, rather than for the formulation of policy and the recording of judgments. But it may be said that the main exhibition, housed in the Royal Academy, was largely composed of the town planning exhibitions shown in the spring at Berlin and in the summer at Düsseldorf, of which THE SURVEY readers are already informed; that the other exhibitions were collections of prints, maps, plans, etc.—many of them very old and valuable—the property of the institute and of the Corporation of London; and finally, that the whole rich program was carried out with the most extraordinary efficiency and perfect management. For the rest, one must note only the high lights in the vast, kaleidoscopic picture which the mind's eye sees as one looks back on the busy week. To a SURVEY contributor, of course, these high lights shine on the problems of social welfare

more intensely than on those of architecture, traffic or commerce. For town planning is a many-sided question, including in its scope all that is of interest to urban dwellers. It was a tribute to its breadth of view that sociology received as much attention as it did, in a conference called by architects, and in which those whose interest was primarily social were in a small minority compared to the professional architects, the engineers, and the city councillors.

The program, very briefly summarized, provided for an inaugural meeting at the Guild Hall on Monday, at which the principal address was by John Burns; then for a big general meeting every morning, at which the principal papers were submitted; and for two afternoon meetings each day, at which were given papers on special phases of the morning's general subject. To the two Americans who presented papers places were given on the morning programs, and such audiences did these sessions draw that the great gallery proved insufficient and overflow meetings had to be held. The general theme of Tuesday was The Cities of the Past; of Wednesday, The Cities of the Present; of Thursday, City Development and Extension; of Friday, Cities of the Future. The paper of D. H. Burnham of Chicago came Friday morning; that of the writer, the other American, on Wednesday. Mr. Burnham discussed democracy and town planning, finding in the power of the people the great hope of the future. The writer considered the connection between street widths and rents and the folly of standardizing streets.

It was doubtless due to Mr. Burns that social welfare occupied quite as important a place as it did in the conference discussions. One could not expect that it would have first place. But John Burns emphasized it strongly; and the point which a cabinet minister, who was also author of the town planning act, emphasized in an hour's stirring address was likely to stick in the minds of the delegates. He stated the belief that squalid environment is a direct cause of a poverty of spirit akin to lack of means and not less deplorable. "The cheerful spirit," said he, "is very difficult in Tabard street in the Borough; hope is not eternal in Hard street, Walworth, and you do not find much of the buoyant temperament in Peter street, Westminster. . . . Some of us think that the town where the money is made ought to be as cheerful as the town where the money is too often foolishly spent. . . . The East End wants West-Ending. Wigan must be taken in hand as well as Westminster, the Potteries as well as London, and Bermondsey needs it more than Belgravia." He traced the suffering due to sickness, and declared that to fight disease we must "let the sun and air into our houses and our streets. Motherhood and youth demand the demolition of the slum, and ask for the pleasant town and the comfortable but dignified city." Again, he said: "Mean streets breed mean men. It is not an accident that the stately homes of England, the delightful country parsonages, the beautiful public schools have produced the Ruskins, the Kingsleys, the Nelsons, the Wellingtons, the Newtons and the Darwins." He recounted from his own experience how much he felt he owed to beauty of environment when a Westminster apprentice. "Make wider roads, but"—he added, "don't narrow the tenements behind."

The garden city movement, which was very fully set forth in the conference, owes the greater part of its interest to its social aspect.—and this in spite of the picturesque architecture that has become associated with it. Both Raymond Merwin, the garden city architect, in a formal paper of a morning session, and Mrs. Barnet, the "mother" of Hempstead, in a papers which she read to the visitors to that city, emphasized the importance of intermingling the classes in suburban districts. This, they thought, could be accomplished, as to some extent it is now at Hampstead garden city, by bringing houses of different sizes together.

The paper by Dr. Eberstadt of Berlin was a very frank and generous comparison of English and German town planning methods—much to the advantage of the former. English visitors, said he, are driven through the imposingly broad

streets of modern German towns, where "they see asphalt enough to empty half the pits of Italy, a show of granite sufficient to level the mountains of Sweden, and lines of huge five- and six-storied tenements." They admire the effect; but the Germans, he said, wish to do away with a system so pernicious for the people; their aim now is the English home, the cottage, the individual house." Admiration for the German method comes too late. To admire it now is like getting a play from Paris or a scarf from London at the moment that it goes out of fashion. But the German method, he added, was worth studying, for nowhere could one better see the connection between street planning and housing, which is the basis of social life.

There were several papers on parks and open spaces—a matter in which the foreigners could teach Americans little. In fact, the idea of radial parks, which has ceased to be a novelty in the United States, was received with great interest and some enthusiasm. The *Westminster Gazette*, summing up the results of the conference several days after it had closed, reported a unanimity of opinion "as to the evils of a uniform street width for needs totally unlike . . . resulting on the one hand in unnecessary cost, reflected in rent, and on the other in main arteries totally inadequate to carry a large stream of traffic"; a general preference, if there must be choice, for radial parks rather than for isolated patches of open space; and a disavowal on any wise town planner's part of a wish for "a clean slate" that he might make his designs unhampered by the historical evidences of a people's development.

As far as it goes, this summary is probably accurate; but the strongest general impression which one carried away from the conference was of the virility, the breadth and might, of the town planning movement; of the high aim and earnestness of purpose which characterized its exponents from many nations, and the consequent belief that for cities a new "dream . . . is coming to birth."

THE DEVELOPMENT IN THE WORK OF CHILDREN'S PROTECTION

C. C. CARSTENS

During the week of October 10-15 in conjunction with the thirty-fourth annual meeting of the American Humane Association in Washington, the First International Humane Conference was held, which was attended by representatives from many states, Canada, Great Britain and other European countries. The meetings were the first to be held in the commodious new building of the United States National Museum. A humanitarian exhibition was installed in adjoining rooms. It was the week following the sessions of the International Prison Congress, and a number of delegates from abroad remained in Washington for the Humane Conference.

In interpreting the development of the American Humane Association, one must not lose sight of the fact that it is a federation of societies and individuals interested in the prevention of cruelty to both children and animals. Organized work for the protection of animals began in England in 1824 and even in New York it antedated protective work for children by eight years. In 1874, when the New York Society for the Prevention of Cruelty to Children was organized—the first society in the world distinctively organized for the protection of children—several humane societies were already actively at work, the Illinois and Minnesota societies since 1869, Washington (D. C.) 1870, Oregon, 1872, and Atlanta and Cleveland, 1873.

It was not surprising that this effort to protect children from the cruelties of recreant parents or guardians soon developed large enthusiasm. Many societies for the prevention of cruelty to children were organized between 1875 and 1885, and the previously organized humane societies broadened their purposes to in-

clude work for children. Naturally the emphasis in this work, because of its relation to the protection of animals, was on prevention of physical cruelty and punishment of offenders. As a result, shocking cruelties, many times so revolting that they may not be mentioned in public, have been materially reduced in number, and the whole civilized world has felt a humanizing influence in which these societies have been among the strongest forces.

But during the last thirty years, besides recognizing the constant presence of flagrant physical abuse of the type which led to this movement, new forms of protection have been recognized. We have become increasingly sensitive to the fact that many children are living in unwholesome and immoral surroundings; that they are underfed or infected with loathsome diseases; that girls, while mere children and before they know what they are doing, invite or are unwillingly subjected to horrible abuses from men, and that all these are worse than the inhuman punishments common in an earlier day. A study of children's abuses has naturally directed attention more toward the future welfare of the child and less toward mere punishment of the offender. It is also recognized that a multitude of other agencies include in their purposes the protection of children though they may seek to accomplish it in other ways.

The question whether certain societies had, or should have, distinct police functions has therefore become of decreasing interest at successive conferences, because of the broadening purposes of children's protective societies to satisfy the needs that exist in their respective communities, and the question as to what functions a children's protective society can well serve in the community has been increasingly thrust into the foreground.

It was noticeable at this year's conference that the combination of work in behalf of animals and of children in one society was held a detriment, especially to the work for children. The sentiment was frequently, though perhaps not often publicly, expressed that the proper development of children's work by children's protective societies requires a complete separation of the two functions. These functions, which were originally similar, are growing increasingly diverse as the viewpoint of the child's future, and not the mere punishment of the offender, is more universally accepted among our societies. On the other hand, where this combination of work has persisted in growing communities, societies are constantly in danger of not keeping up with community needs and by that means of giving occasion for other agencies, particularly juvenile courts, to take over the children's function, a result that is not necessarily for the best interests of the child. It was therefore urged that in every community of 50,000 inhabitants or over a separate children's protective society be organized, and where a society performing both functions exists, that they be separated by the formation of a new society. To encourage this movement, the employment of a field secretary was considered. He should assist in organizing new societies, in resuscitating moribund organizations where practicable, and in standardizing work.

Inevitably, such a differentiation of functions and such a recognition of the broadening purposes of a children's protective society led to consideration of the relation of the children's work of the American Humane Association to the work of the children's committee of the National Conference of Charities and Correction. In order that the functions of the two organizations may be better understood, a committee of three members of the American Humane Association has been appointed to visit the National Conference at its next meeting in Boston and report on the advisability of arranging co-operative relations.

Perhaps the most important result of the Humane Conference was the clear recognition of the necessity for trained service. First steps were taken to bring the needs of children's protective work to the attention of schools of philanthropy, that they might adapt their courses and practical instruction to the work of these societies, with the alternative, if this cannot be brought about, that a separate school be founded for training humane workers.

The last three days of the week were

given to considering the protection of animals, and these meetings were the more largely attended. The exhibits in animal protection were particularly interesting, that of the Pennsylvania Railroad being perhaps the most notable.

Dr. William O. Stillman of Albany, N. Y., was elected president for the sixth successive year, and Nathaniel J. Walker, also of Albany, secretary. The next meeting will be held in San Francisco in October, 1911.

FIFTEENTH ILLINOIS CONFERENCE OF CHARITIES

GRAHAM ROMEYN TAYLOR

Social advance and civic reform are keeping pace in Illinois this fall. The Peoria Conference[1] started the citizens' campaign against political corruption and for progressive legislation to safeguard popular rights. The State Conference of Charities at Galesburg, October 22-25, proved to be the most successful rally of forces for social advance the state has thus far seen. Both gatherings were characterized by earnest enthusiasm and a focusing of effort on urgently needed legislative "next steps."

The two movements joined hands in support of the effort to extend the merit system, one of the three referendum propositions urged by the committee of seven of the Peoria Conference, to be voted upon November 8. Charles L. Capen of Bloomington, chairman of the Peoria Conference, made one of the principal addresses at the Galesburg conference of charities. He pointed out the evil effects of the spoils system in the penal institutions of the state. These, as well as many other administrative branches of the state government, will come under the civil service—as the charitable institutions now are—if the referendum vote is carried and the next Legislature executes the will of the people.[2] The conference of charities unanimously adopted a resolution favoring this extension of the merit system. The evolution of civil service in Illinois was traced with painstaking accuracy in a paper by Joseph C. Mason, secretary and chief examiner of the State Civil Service Commission.

Two of the most important sessions were devoted to public health, one on tuberculosis and the other on mental diseases. The Sunday afternoon mass meeting listened to Dr. Woods Hutchinson at his best as he told of the frontal attack which the whole community must make if consumption is to be exterminated. He referred to the pride of the medical profession in breaking loose from traditions to assume a new and active part in public life and work. In emphasizing the value of fresh air he pointed out that the fine houses on the avenues are frequently the least ventilated. Of 350 observed at 5 o'clock in the morning open windows were found in only twelve. Such conditions mean that tuberculosis bacilli are born and reared almost as pets. A big community campaign would very perceptibly check tuberculosis in five to seven years, and the money Illinois loses every year by disability and death from this disease could rid the state of it in a comparatively short time. The social implications of such a campaign would mean injustices corrected, a fair chance for children, a humanized standard of living, fewer orphans and widows, and fewer crimes occasioned by dependence. Dr. Hutchinson closed his fine address by saying that the undying human service of efforts against the plague constitutes in itself a religious sanction.

Bad housing and Its Relation to Tuberculosis was discussed by Charles B. Ball, Chicago's chief sanitary inspector, who cited many authorities to show that "evils worse than wars"—darkness, dirt, dampness, overcrowding and bad air—curse the houses of the poor in congested districts and cause tuberculosis to thrive.

Dr. Caroline Hedger of Chicago told the story of open-air schools. Referring especially to those in Chicago, she said that 92 children gained 230 pounds in

[1] See THE SURVEY for September 3 and October 1.

[2] Pending returns at the time of going to press indicate a sweeping victory for civil service extension.

a total of 3,148 days of attendance at a cost of $1,200. As a result, the child is taught that he owes it to the community to take care of his health and strength; teachers are taught to build the child as a whole, physical as well as mental, into a citizen; and the community is taught not to impose conditions that blast life.

A special gathering of secretaries, nurses, and other workers connected with tuberculosis organizations drew an attendance of thirty including several people from nearby states. Attention was centered on the question of a state sanatorium. The consensus of opinion was opposed to it on the ground that the state is too large a unit, as proven by experience in other large states; that advanced cases should not be sent across the state to die, and that under Illinois laws cities, villages and counties have power to establish sanatoriums, which in their educational value should prove more effective than a state institution. It was pointed out that a state sanatorium would unfairly impose double taxes on such progressive localities as establish their own sanatoriums.

Discussion of The Prevention of Mental and Nervous Diseases by Dr. V. H. Podstata of Chicago, former superintendent of the Elgin State Hospital for the Insane, was especially timely in view of the recent organization of the Illinois Society for Mental Hygiene.[1] He outlined a legislative and educational program for the state as follows:

Legislative: (1) Study by the state or national government of the causes of mental breakdown. (2) Elimination of inherited weakness through regulation and often prohibition of marriage, sterilization of those unable or unwilling to abide by laws regulating marriage, and segregation of the hopelessly defective. (3) Safeguarding motherhood—especially by relieving the wives of the poor of worry and work. (4) Hospitals for alcoholism so as to avoid the mingling of alcoholic and insane patients. (5) A systematic fight against excessive drinking. (6) Every person legally detained for any cause to be examined for so-called blood diseases; if found infected to be treated until free from infection; such diseases to be dealt with as are other dangerous infectious diseases. (7) Psychopathic or neuropathic hospitals in every large city to provide early treatment; admission voluntary and with little legal formality. (8) Intelligent supervision of patients discharged from institutions for the insane, feeble-minded and epileptic, for such a period as to protect the patient against relapse.

Educational: (1) Public instruction in upper primary grades on sexual hygiene and the social evil and its consequences. (2) Public instruction on rearing children and home welfare. (3) Co-operation of teacher and physician with reference to abnormal children.

In line with this program, Dr. H. G. Hardt, superintendent of the Lincoln State School and Colony for the Feeble-minded, urged that attention be directed to the high class border line cases of feeble-mindedness termed "moron" in the classification recently adopted by the National Association for the Study of the Feeble-minded. These cases appear at home to be normal and cause many illegitimate births of still more defective feeble-minded children. By means of the new Binet test, Dr. Hardt said that it has become comparatively easy to discover the moron cases which have heretofore been so difficult to diagnose. He urged also that the state provide additional institutions so that classification of cases may be accomplished better than it now is at the Lincoln Institution, which handles all the feeble-minded whether they are young or old or have additional defects such as blindness or deafness.

The movement in Illinois to secure an adult probation law, which failed at the last legislative session and is now being renewed in view of the forthcoming session, gave special point to an address on Adult Probation by Edwin E. Mulready, deputy commissioner of the Massachusetts Commission on Probation. He outlined the experience in Massachusetts, upon which was based the proposed Illinois law, and said that out of 150,000 arrests, 15,000 lawbreakers—of whom 3,000 were children—were placed upon probation. The economy of the system—Massachusetts spends $208 a year on each prisoner—is surpassed by the saving of character through the judicious work of probation officers, many instances of which were cited. Mr. Mulready emphasized dis-

[1] See THE SURVEY for August 20.

crimination and classification as essential for the best results. That care in these respects is necessary with regard to parole as well as probation is evident in the light of atrocious crimes which have recently been committed in Illinois by paroled prisoners. The conference adopted resolutions in favor of an adult probation law and an increase in the number of parole agents.

One of the noteworthy addresses was by Sophonisba P. Breckinridge of the Chicago School of Civics and Philanthropy on The Community and the Child. She declared that the home should be maintained at all cost and not broken up if the trouble is simple poverty. The various ways of accomplishing this, she described, such as the Scottish "special list" which provides for poor families, the juvenile court law in California which allows the family out of public funds eleven dollars a month for each child if the court sees fit, and the compensation scheme of the Chicago Jewish Aid Society, which pays a pension to the mother for doing the thing which the community would have to do if it took the child from the mother. Miss Breckinridge urged that the cause of the poverty of the family, if it involves no moral delinquency, should make little difference in the community's purpose to keep the family together and do the right thing by the child. If the community is to hold together fit families and to discontinue holding together unfit families, some standard of fitness must be worked out, perhaps by the charity organization societies.

From the point of view of real and all-around helpfulness, Mary E. Richmond of the Russell Sage Foundation placed a similar emphasis on the thorough understanding of family situations. She made it clear that the welfare of both the community and the poor depends on the efficiency of social workers in devising plans to deal with the unworthy as well as the worthy. In discussing details of charity organization work, she showed vividly the absurdity of clinging to outworn traditions, and made many suggestions as to methods of questioning and investigating, enlisting co-operation and interest, and relieving the pressure of work by doing each thing well so that it will not involve recurrent treatment. Following her address, the same problems were discussed by Victor Young from the standpoint of his work as assistant county agent of Cook county, and by Mabel E. Beverly, secretary of the Monmouth Charity Organization Society.

The readjustment of delinquent children in life after institutional experience was the subject of some definite suggestions by C. B. Adams, superintendent of the St. Charles, Ill., School for Boys, and Fannie F. Morse, formerly of Massachusetts, now superintendent of the Minnesota Training School for Girls. Colonel Adams said that with more frequent visitation through a larger force of probation officers, many released boys could be saved from careers leading to the reform school or penitentiary. Mrs. Morse pointed out that readjustment depends in some measure on how well the institution prepares the child. She dwelt upon the importance of having the placing-out department directly under the institution rather than under a different organization, and upon the necessity of not sending girls back into an old environment which is still bad.

School care of deaf children occupied one session. Mary McCowen, principal of the Chicago day schools for the deaf, outlined what can and ought to be done in the light of the new understanding that the limitations imposed by deafness are not much greater than the various limitations which affect people who hear. Papers sent by Prof. J. W. Swiler of Burlington, Ia., on the Competency of State Schools for the Deaf, and by Margaret Artingstall of the Jacksonville, Ill., state school on the Educational Value of Basketry in Schools for the Deaf, were read. An interesting local incident was the gathering of a group of deaf people by a former pupil of the Jacksonville School for a little "talk" by Dr. Charles P. Gillett of Jacksonville.

The Illinois Association of Poor Farm

Superintendents met for the last session of the conference, the principal address being by Judge B. R. Burroughs, secretary of the State Board of Administration, who urged that things be provided for the inmates themselves to do, as this might sometimes lead to independence, and that in any event it would add greatly to the interest in life. He also dwelt upon the need for better buildings and sanitation. The association re-elected as president S. D. Weiser of Carthage and chose as secretary William Ehrler of Galena.

A larger number of exhibits than have been displayed at previous conferences were shown. Most noteworthy was a large map of Springfield prepared by Health Commissioner George T. Palmer, indicating every house, well, privy, sewer and water main and giving other data. Perhaps never before has so complete a sanitary map of a community been prepared, yet its cost was only sixty dollars, the work being done by Dr. Palmer's enthusiastic regular force. Other interesting exhibits were a poverty map of Chicago prepared by the United Charities, a showing of tuberculosis activity from various points in the state, and of handicraft work from the state hospitals for the insane, taught by attendants trained in the courses of the Chicago School of Civics and Philanthropy.

For the first time in the history of the Illinois conference the sessions included a Sunday. This arrangement, which has been so successful in Indiana and elsewhere, proved equally so at Galesburg, and the whole city seemed to be stirred, the appearance of delegates in the local pulpits helping materially. The Rev. E. B. Rogers of Champaign in his conference sermon issued a splendid challenge to the church to do its duty for social betterment, driving home his message by asking church people if they knew the facts of social conditions.

Advantage was taken by Galesburg people of the opportunity to confer with recognized leaders concerning the possible organization of a local associated charities. The evident interest in social questions aroused among the students of Knox and Lombard colleges in Galesburg may in some degree have determined the selection of Urbana and Champaign—the location of the University of Illinois—as the meeting place for 1911.

The presidential address of William C. Graves suggested a program of social legislation which was embodied in the main in the resolutions adopted by the conference. In addition to those already mentioned they are:

Place the two penitentiaries and the reformatory under supervision of the State Board of Administration.

Eliminate political qualifications, short terms and small salaries from this law.

Transform the Cook County Hospital for the Insane into a state hospital.

Establish a true psychopathic hospital in Chicago and a state inebriate institute.

Appoint a commission to take a census of the blind in Illinois.

Furnish more experienced care for education of the feeble-minded, and

Furnish two state schools for delinquent boys and girls.

That the conference, through a committee, study infant mortality in Illinois;

That a State Board of Children's Guardians be provided for by law;

That the conference co-operate with the committee on family treatment in establishing charity organization societies in Illinois cities; that the co-operation of public and private agencies be promoted; and that destitute people be not passed on from city to city without investigation as to the responsibility of the people to whom they are sent.

The following officers were elected:

President, Sherman C. Kingsley of Chicago; vice-presidents, Mrs. R. N. McCauley of Normal and W. E. Simonds of Galesburg; secretary, A. L. Bowen of Springfield; committee chairmen: executive, F. E. Lyons, Chicago; feeble-minded children, H. G. Hardt, Lincoln; social legislation, F. H. Wines, Springfield; exhibits, Mrs. Mary R. Parsons, Jacksonville; children, Colonel C. D. Adams, St. Charles; family treatment, Pert. N. Hiser, Peoria; infant welfare, Dr. Caroline Hedger, Chicago; social hygiene, Dr. George T. Palmer, Springfield; corrections, Prof. C. R. Henderson, Chicago.

MASSACHUSETTS STATE CONFERENCE OF CHARITIES

The Eighth Massachusetts State Conference of Charities met October 26-28 in Fitchburg, the smallest city in which a Massachusetts conference has yet convened. Judging from the attendance, however, both of delegates and citizens, the smaller communities have a livelier interest in charity conferences than the big cities, where social problems are more acute. At any rate the Fitchburg meeting was one of the most successful in the history of Massachusetts conferences, in point of attendance and in general interest.

At the session on Wednesday the delegates were welcomed by Mayor O'Connell. David F. Tilley, the conference president and president of the Society of St. Vincent de Paul, Boston, spoke for broad-mindedness in religious and social work—broad-mindedness which would forget creed and differences of opinion in considering great questions of social work. "The man or woman who is earnestly religious," said Mr. Tilley, "cannot be bigoted, and we must not mistake bigotry for sincerity."

The first session of the conference was given up to the subject of recreation. Frank L. Boyden, principal of Deerfield Academy, presided. Joseph Lee spoke in favor of Sunday play.* Sunday has become the great day for gambling and lawlessness in the cities, Mr. Lee thinks, because we forbid work and we forbid play and we close the public schools.

> We cannot spend all our waking hours in church, even if all the hours we spend there are waking hours.
>
> Our Sunday laws are also an evil to those who are at work. The reason for the existence of Sunday is that there is a great deal more in human nature than can be packed into week-day pursuits, especially under conditions of modern industry. Sunday is the day of compensation, the day of the lost talents, the day for the exercise of those essential powers of our human nature for which the week day left no room and without the use of which we are not quite alive. Our Sunday laws defeat the purpose for which Sunday stands. They forbid its true observance.

*For a full statement of Mr. Lee's views see THE SURVEY for October 1.

Lee F. Hanmer explained the boy scout movement and said that in less than half a year 150,000 boys have been enrolled in the Boy Scouts of America. Some 350 local committees have been formed, which have appointed approximately 2,500 scout masters in forty-four states, in Porto Rico and the Philippines.

The Thursday morning meeting was devoted to the question of insanity. Owen Copp, the secretary of the State Board of Insanity, reviewed recent progress in the treatment of mental disease in Massachusetts, giving the two great problems of the future as "the early and adequate treatment of acute and curable mental disease with the hope of its prevention and cure, which is the main purpose of the new psychopathic hospital in Boston, and the re-education and occupation in recreational activities and useful industries of the many comfortable chronic patients in institutions, to whom the pleasures and natural interests of a home should be afforded, in farm and industrial colonies similar to those at Templeton, Gardner and Grafton."

Dr. E. E. Southard of the Harvard Medical School explained the purpose of the new psychopathic hospital at Boston, which plans to cure "sick people" rather than to lock up the "legally disabled." Dr. Southard thinks that when insanity is looked upon as a disease, the lot of the insane—particularly of the borderland cases—will be greatly alleviated. Industrial Activities for the State's Dependents was the title of a paper by Edmund A. Whitman of Cambridge, who said that even excited and demented patients can do useful and lucrative work. The success of the Gardner State Colony, which was visited in the afternoon, well proved Mr. Whitman's point. The colony consists of an estate of fifteen hundred acres which is being gradually di-

vided up into farms to be brought under cultivation and tilled by the patients, who live on them in groups of twenty-five to one hundred. In the houses may be seen many patients busily working on rugs, weaving cloth and baskets, embroidering, tailoring and shoemaking.

On Thursday evening, under the chairmanship of Harvey H. Baker, justice of the Boston Juvenile Court, the conference discussed the Neglected Child, who Judge Baker thinks is a far more important and fundamental difficulty than the delinquent child, because neglect usually leads to delinquency. Thomas B. Fitzpatrick of Brookline dwelt on the importance of the public's attending to its neglected children and Eldon B. Keith, president of the Brockton Y. M. C. A., spoke on The Relation of Societies for the Prevention of Cruelty to Children to Cases of Neglect. About a year ago the Brockton branch of the S. P. C. C. was established and during that period about ninety cases, involving 266 children, have been handled. Mr. Keith believes that the smaller the place, the greater the need for organized effort of this kind.

In the small community a citizen of standing cannot individually handle such cases as may come to his attention, because of the attendant publicity and community knowledge of the affair. No society or organization can do its best work without local support. This is why the Massachusetts society has instituted the formation of local branches.

Nathan C. Upham, truant officer of Fitchburg, speaking on Truancy and Neglect, said:

When proper home conditions exist real truancy is reduced to a minimum. When the parent does not realize his responsibility in the proper training of his child, he should be brought into court and punished for failing to co-operate with the school official in his effort to break up truancy.

Mr. Upham cited several instances where parental neglect was responsible for truancy. In such cases the children cannot fairly be called truants. The truant officer should do all he can to improve such homes through the co-operation of the church, the relief agencies and the children's aid societies. If those means fail he should bring the children before the court as cases of neglect rather than of truancy.

What Massachusetts Does with Neglected Children was the subject of a paper by James E. Fee, superintendent of minor wards of the State Board of Charities. Mr. Fee said that the state aims to procure for each child the nearest approach possible to a normal home. When families can be rehabilitated, the children who have become state wards are gladly returned, but in the meantime juvenile dependents are clothed and fed and sent to school.

The state's children turn out very much like other children. There are some who come to grief and have to be disposed of by transfer and commitment to the state's institutions for delinquent children. These are comparatively few in number and I doubt if the percentage is much greater, if any, than that in the community at large. The state also has its conspicuous successes, and some of its children so improve their opportunities that they become part of the best life of the community.

The discussion on the Neglected Child was led by Zilpha Smith, assistant director of the School for Social Workers, Boston. Non-support was discussed under the chairmanship of Alice L. Higgins, general secretary of the Associated Charities, Boston, who reviewed the nature of the problem and the duties of courts, societies and individuals in attempting to rehabilitate the family. C. C. Carstens, general agent of the Massachusetts Society for the Prevention of Cruelty to Children, gave the results of a study of non-support cases and advocated improvement in handling them. He favored probation, but said that the administration is often at fault. Edwin Mulready, deputy probation commissioner of Rockland, presented facts and figures to show the success of probation. He said that last year $25,000 was collected from 617 cases of non-support in Massachusetts, and this year over double that amount has been collected. In the Boston Municipal Court alone the increase has been from $1,400 to $4,300, and in Roxbury from $3,600 to nearly $9,000. Judge Charles Almy of Cambridge spoke on Probation in Non-Support Cases. He said:

Non-support cases vary greatly in merit. In

some cases the wife is extravagant or incompetent, but insists on holding the purse strings. In other cases the complaint in court is the result of a spree on the part of the husband who is ordinarily a good husband. In most cases the parties can usually be brought together without proceedings in court, and it is much better that they should be. It is the duty of the probation officer, though he gets no credit for it in his statistics, to take all such cases in the beginning and try to keep them out of court.

The final session of the conference was given over to Co-operation under the chairmanship of Frances G. Curtis of the State Board of Charity. Miss Curtis outlined the mutual help that should exist between public and private agencies. Mrs. H. D. Sleeper explained how co-operation works at Northampton, and Dr. H. Lincoln Chase of the Brookline Board of Health read a paper on Co-operation for Public Health. Ida G. Cannon of the Social Service Department of the Massachusetts General Hospital led the discussion.

The place of meeting of the 1911 conference will be decided by the executive committee. The officers are as follows:

President, Dr. Walter E. Fernald of Waverly; vice-presidents, Frances G. Curtis of Boston, William H. Hardy of Boston and Dr. J. F. C. Adams of Pittsfield; secretary, Parker B. Field of Boston; treasurer, Lehman Pickert of Boston.

OHIO'S PROBLEMS

FRANCIS H. McLEAN

Undoubtedly the specific problem emphasized by the sessions of the Ohio Conference of Charities and Correction in Newark, October 14-17, was proper state care of girl and young women delinquents. In the address by Blanche Vignos of Canton, president of the Board of Visitors, on Needs of Some State Institutions, the distressing conditions existing in the Delaware Industrial School for Girls (under sixteen) were vividly presented. This has been a frequently visited institution of late, and many people have expressed their opinion of it; but Miss Vignos gave the whole plain story.

There is, of course, the man superintendent, because Ohio permits only electors to serve in responsible positions in state institutions. More of this in a moment. Furthermore, there is the gravest suspicion as to whether all the counties have religiously obeyed the law and have not sent hither dependent girls on nicely arranged delinquency charges, thus relieving the county of future thought. Certainly the kinds of girl vary; no classification is possible with the overcrowding; the reception ward has no facilities for preventing the spread of infection among girls detained there. Girls sleep two in a bed and it is affirmed that there are, and in fact can be, no adequate safeguards against infection.

Again, at the great meeting on Sunday afternoon, when the auditorium of the High School building was filled and when the Delaware home choir itself gave the service of music, Katharine B. Davis, superintendent of the State Reformatory for Women at Bedford, N. Y., told what a real reformatory for women is. For be it known that Ohio has absolutely no correctional facilities for girls and young women over sixteen except the state prisons. Knowing the different brands of conservatism which have ever hedged the Ohio state institutions, Dr. Davis fought her battle with brilliancy and dash. No reformatory or industrial school for girls could possibly succeed without a woman superintendent. If there is a constitutional provision against appointing such an officer, knock it out—nothing is impossible. Don't kick the poor Legislature, but the public behind it which does not say to the lawmakers, "This you must do!"

All this has given impetus to a current campaign in Ohio, involving the establishment of a woman's reformatory, the complete reorganization of the Delaware school and lastly the abolition of the utterly absurd constitutional provision above referred to.

The presidential address on Isms by Dr. Henry C. Eyman, superintendent of

the State Hospital at Massillon, was a splendid exposition from something of a new standpoint of the essential unity of all real social effort, with some telling illustrations from the speaker's special field. The power of suggestion to furnish newer interests to take the place of older and evil tendencies in a subject's mind, the social theory plus the personal touch with the individual human being—nay, indeed, the need of this for even the most general of social reform—this was the theme.

Dr. Louis Stricker of Cincinnati in his address, Is Work for the Blind Desirable, presented the results of the Blind Relief Commissioners' work in connection with pensions for the blind. The most significant part of this report urged that workshops be established in various sections of the state to supplement the state school. Dr. Stricker contended that the more ignorant blind could not make their own way, but that these workshops, with organized industry and centralized output, would enable the incompetent to support themselves. Attention was called to the lack of success of some state school graduates. Whether Dr. Stricker's suggestion regarding workshops, or that of a permanent society for the welfare of the blind, to develop their industrial abilities and fit them into the right niches, promises better results, may give rise to difference of opinion; but how limited the opportunities are for self-development by the blind in Ohio, both on account of the scope of the state school and the mistaken sentimentality of the friends of the blind, was the burden of Dr. Stricker's paper, and constructively his considerations deserve the closest examination.

The remainder of the general session programs covered Admission, Treatment and General Management of the Insane, by Dr. Charles Gilliam, superintendent of the State Hospital, Columbus; Cure of the Feeble-Minded, by Dr. E. J. Emrick, superintendent of the Institution for Feeble-Minded, Columbus; The State Sanatorium, by Dr. S. P. Wise, president of the Board of Trustees, Nullersburg; The Dependent Colored Child, by the Rev. R. A. Longman, Cincinnati; The Child Labor Situation in Ohio and Neighboring States, by E. N. Clopper, Ohio Valley, secretary of the National Child Labor Committee; The Delinquent Parent, by Judge Samuel L. Black of Columbus; Impulse and Law, by the Rev. George Stibitz, of the Central Theological Seminary, Dayton; Thirty Years' Experience by Addie Kidwell, governess Children's Home, Marietta; Traffic in Babies, by Dr. H. M. Platter, inspector of the State Board of Health; Some Phases of the Work of a Humane Society, by A. B. Williams, Jr., superintendent Humane Society, Cleveland; Needs of Newark in Organized Charity, by Francis H. McLean, field secretary, Charity Organization Department, Russell Sage Foundation; School Gardening, by Louise Klein Miller, curator of gardens, Board of Education, Cleveland.

There were well attended section meetings of infirmary directors and matrons, county visitors, children's home officials and matrons, blind relief commissioners, city charities and the Ohio Crittenton League.

The conference meets next year in Toledo. The officers are:

President, the Rev. R. A. Longman, Cincinnati; vice-presidents, Mrs. Apollo Opes, New Philadelphia, and the Rev. Joseph A. Bennett, Newark, secretary, H. H. Shirer, Columbus.

MAINE STATE CONFERENCE

The fourth annual meeting of the Maine State Conference of Charities and Corrections was held in Portland October 26-29 under the presidency of William DeWitt Hyde, president of Bowdoin College.

The program was in practical touch with the needs of the state. Juvenile delinquency and juvenile courts were discussed by George E. Fogg of Portland, Hastings H. Hart of the Russell Sage Foundation and Mary Dewson. The conference appointed a committee to cooperate with the Maine Prison Associa-

tion in securing needed legislation this winter. The need of a state board of charities was presented by President Hyde, Robert Treat Whitehouse, United States district attorney, and Alexander Johnson, secretary of the National Conference of Charities and Correction. Vocational direction for young people was discussed by Everett W. Lord of Boston. The Rt. Rev. Louis S. Walsh, bishop of Portland, delivered an address and the work of the new Maine School for the Feeble-Minded at Pownal was described by Dr. George S. Bliss. Mrs. A. R. Scott of the Bangor Associated Charities dealt with problems of outdoor relief.

Dr. F. H. Gerrish of Portland gave an impressive address on The Social Havoc of Venereal Diseases, in which he showed their enormous prevalence and destructiveness, the futility of public licensing and registration, and the necessity for a sane and wholesome attitude toward the whole subject, arguing especially for freer discussion and the instruction of children by their parents. He urged that venereal diseases be made reportable to boards of health and that legislation be secured making the communication of such diseases a crime.

Prof. Robert J. Sprague of the University of Maine called attention to the number of divorces in the state and assigned as one cause the lack of sanctity in the marriage ceremony as performed in law offices by justices of the peace and other officials. He advocated legislation to insure a proper performance of the ceremony and to restrict the places where it may legally be performed to homes, churches, and rooms especially designated by municipalities.

The closing sessions were in charge of the Maine Children's Committee, an organization of child-helping agencies of the state established a year ago with the aid of the Russell Sage Foundation to facilitate co-operative work in child-placing in foster homes. It was decided as a result of these sessions to continue the work and to sustain it entirely by the resources secured from the constituent organizations, making the movement self-supporting.

The following officers were elected: President, E. P. Wentworth, superintendent State School for Boys; vice-presidents, the Rev. John H. Quint, Brunswick; Prof. Robert J. Sprague, Orono; secretary, Mrs. A. R. Scott, Bangor; treasurer, Charles H. Hitchborn, Augusta.

THE NEW YORK CAMPAIGN FOR THE PREVENTION OF INSANITY

HOMER FOLKS
SECRETARY, STATE CHARITIES AID ASSOCIATION

THE SURVEY of August 20 gave some account of the proposed work of the Connecticut, Illinois and Missouri Societies for Mental Hygiene. Announcement is now made of the beginning of active work in the field of the prevention of insanity in New York state, by a special committee of the State Charities Aid Association. In 1906 this association appointed a special committee on after-care of the insane. In the course of two years it became evident that the work of after-care led naturally and inevitably to the work of prevention, and the committee became the committee on the after-care, relief and prevention of insanity. More recently its name has been shortened to committee on mental hygiene.

The members of the committee include Dr. M. Allen Starr, Dr. Charles L. Dana, Dr. Frederick Peterson and Dr. Bernard Sachs, all physicians of wide experience in the treatment of mental and nervous diseases. Louisa Lee Schuyler, who was chiefly responsible for the adoption of the policy of state care of the insane in New York, has been an active member of the committee since its appointment. The president of the State Commission in

Lunacy, Dr. Albert Warren Ferris, the director of the State Psychiatric Institute, Dr. August Hoch, and the general medical superintendents of the two state hospitals for the insane, located in Greater New York, Drs. William Mabon and William L. Russell have consented to serve as *ex-officio* members. Florence M. Rhett, a member of the board of managers of the State Charities Aid Association, is chairman; Homer Folks, secretary, and Mary Vida Clark and Everett S. Elwood, assistant secretaries. Miss Clark has for several years had immediate charge of the State Charities Aid Association's work in behalf of the insane. She has been closely identified with the development of after-care work and has gained recognition as an effective advocate of advanced measures in the care of the insane, of the broader social mission of the state hospitals. Mr. Elwood is a graduate of Syracuse University, and has been principal of the Academy at Penn Yan, N. Y. He left the latter position to devote his entire time to the work of the committee on mental hygiene.

The committee undertook some months ago to raise a fund of $6,000 a year for three years, and has already secured contributions amounting to $4,200 for three years, and an additional $500 for the first year.

The lines of work which the committee has decided to undertake from the outset include the following:

1. An effort to secure the active cooperation of state authorities in a statewide movement for the prevention of such forms of insanity as are already known to be distinctly preventable. The president of the State Commission in Lunacy, Dr. Ferris, is deeply interested in this subject, and has already gone on record in favor of bringing the various hospitals into much closer relations with the medical profession and with social workers in their respective districts, and also in favor of a general campaign of education as to the causes of insanity. His colleagues, Commissioners Sheldon T. Viele of Buffalo and William Cary Sanger of Oneida county are in full sympathy. The commission will undoubtedly ask the Legislature of 1911 for an appropriation to enable it to undertake educational work, and the committee on mental hygiene will lend its active support to securing such appropriations as may be necessary to enable the State Commission in Lunacy to do in this field, work similar to that done by the Department of Health in the prevention of tuberculosis. The close and effective co-operation between the New York State Department of Health and the State Charities Aid Association has been one of the most important features of the state tuberculosis campaign, and has greatly contributed to the degree of success attained. It is believed that in this later preventive campaign, the dignity and prestige of the state and the initiative and interest of private benevolence will co-operate from the start in an equally effective manner.

2. A campaign of popular education as to the causes of certain forms of insanity, as to which there is a comparative unanimity of opinion among medical authorities. The committee has already issued one leaflet (State Charities Aid Association Publication No. 117), The Prevention of Insanity, which states briefly the range of our present knowledge as to the causes of insanity, based largely upon the close study of the history of each patient, which has been carried on in recent years in state hospitals. In this leaflet the following are indicated as causes of insanity which may be regarded as preventable:

(a) General paralysis, also called paresis, and popularly known as "softening of the brain," is considered by medical authorities as being, in from 85 to 100 per cent of cases, a result of syphilis. This is a particularly distressing form of insanity, being incurable, resulting in rapid physical and mental deterioration, and in death in a few years. It comprises from 14 to 21 per cent of new admissions of men to state hospitals, and from 4 to 8 per cent of women.

(b) Alcohol is a direct and unmistakable cause of insanity in a very considerable number of cases. In many more cases alcohol is undoubtedly an important contributing factor. Statistics as to the exact proportion of cases vary considerably. In the *Medical Record* for May 28, 1910, Dr. Ferris states, "Of the insane in New York state, 28.9 per cent owe their insanity to alcohol." The uncertainty as to the exact total number of cases due to this cause does not, however, impair

the directness and certainty of the relation between alcoholism and many cases of insanity.

(c) Certain physical disorders requiring surgical or medical attendance are often the causes of nervous and mental diseases, and unless relieved lead to permanent mental impairment. Overwork, overstrain, worry and exhaustion, especially when combined with under-nourishment and unsanitary conditions of living, are evident causes of insanity in a certain number of cases.

(e) Less readily recognized, but coming more and more clearly into view, is a cause which may be termed "bad mental habits"; excessive introspection, brooding—the condition which is coming to be known among alienists as "the shut-in personality."

The committee plans to enlist the interest and co-operation of the clergy, teachers, public officials, physicians, leaders in labor unions, fraternal orders, farmers' organizations, and other classes of persons whose position gives them influence, and opportunities for effective service in social betterment. It also plans to publish a leaflet, stating in popular form, with the authority of scientific experts, the essential facts as to the causation of some forms of insanity, stated above. It believes that if the facts concerning the relation of syphilis to insanity, which are as yet hardly known generally in the medical profession, and are practically unknown to the laity, can become widely and clearly understood, a substantial diminution in the number of paretics to be cared for in the state hospitals may confidently be expected. It believes that to bring home to people generally the fact that alcohol is conclusively known to be a cause of much insanity, will have considerable effect upon the habits of the coming generation in this regard. It believes that to make people understand the fact that bad mental habits, which can be described in detail, are apt to lead to insanity, will result in the earlier recognition and consequent earlier treatment of impending mental disaster.

3. As features of the educational campaign, the committee plans, in co-operation with the state authorities, to arrange for a series of lectures in the larger cities of the state. It is hoped that an exhibit familiarizing the public with the more important facts concerning the hospitals for the insane, and concerning the cure and the prevention of insanity, will be prepared by the state, to be shown at various conventions and conferences.

4. The committee has also in mind definite work in bringing to light individual cases of approaching mental impairment at a much earlier stage than at present, and in securing such medical attention and social aid as will, in many cases, delay or prevent what would otherwise have been a serious impairment. There are already in New York city a number of clinics for mental and nervous diseases, including those connected with the Bellevue Dispensary, Cornell Medical College, Vanderbilt Clinic and the Neurological Institute. The work of the existing clinics could be extended, and additional clinics in various portions of the city, connected with public or private hospitals, should be established as rapidly as funds can be procured therefor. It would perhaps be unduly optimistic to look forward to the districting of the city among an adequate number of neurological clinics, comparable to the Association of Tuberculosis Clinics, but such an outcome is by no means an impossibility. It is hoped also that each of the thirteen state hospitals may follow the example of the Ogdensburg State Hospital, which has already established a clinic or outdoor department to which any patient, from any part of the district of that hospital, may go for medical attention, advice, and instruction. A more perfect co-ordination of existing and proposed clinics with public and private relief agencies in all parts of the state, is also contemplated.

In the nature of the case, the work of the committee on mental hygiene cannot attract so wide attention, nor be carried on with the help of so large a degree of publicity, as the campaign against tuberculosis. It is expected, however, that in comprehensiveness, thoroughness, soundness of educational method, co-operation on the part of public and private agencies, and in arousing interest on the part of all classes of people, this later campaign will not suffer by comparison.

Probably no member of the committee has ventured to hazard a guess as to how

much may be accomplished in the way of reducing the volume of insanity by such preventive measures. It is their conviction, however, that it is not necessary to await more complete scientific data, nor a more definite forecast as to precisely what may be accomplished before setting on foot various measures on a considerable scale. The program of work will be flexible, subject to revision and modification as experience may indicate, and as new scientific discoveries may require. It is possible, for instance, that the recent achievement of Professor Ehrlich in producing the remedy, "No. 606", for syphilis may, within a few years, considerably modify the methods most likely to be effective for the prevention of paresis. This possible change in method, common to many forms of social work, should not, in the judgment of the committee, delay a most serious effort to bring home to the population of the state the close relation now existing between insanity and certain factors susceptible of control by the individual or by community action.

The humanitarian aspects undoubtedly interest the committee most. To diminish the volume of disease and consequent suffering and death; to decrease the heavy burden placed on the families and friends of those afflicted; to assist in building up a strong and efficient people —these certainly are worthy objects, fit to engage the active interest and the serious labors of the best and the strongest. The economic aspect, however, is one sufficiently serious to engage the attention of any to whom other considerations might not make a conclusive appeal. The number of insane in the state is now in excess of 32,000—roughly one in every 200 of the total adult population. The average annual increase exceeds 1,000. The annual cost of maintenance exceeds five and one-half million dollars. The necessary cost of new buildings exceeds a million dollars each year. About one-sixth of the entire current income of the state is expended for the insane. In view of these facts, can anyone question the wisdom of expenditure of a modest sum in an effort to secure the effective application of our present knowledge as to the causes of insanity?

A CLINIC FOR INDUSTRIAL DISEASES

JOHN B. ANDREWS
SECRETARY AMERICAN ASSOCIATION FOR LABOR LEGISLATION

Some of us had hoped that industrial America with its wonderful resources, its famed philanthropies and its uncounted thousands of work-diseased men and women, might be first among nations to recognize the need of a special hospital and clinic for industrial diseases. But the honor belongs to Italy.

Eight years ago a group of social-minded medical men in Milan united in a demand for systematic study of diseases of occupation. Four years ago they called together from many nations the first International Congress on Industrial Diseases. Last March they saw the hopes of years culminate in the dedication of the first labor clinic.

"For the scientific study and prevention of occupational diseases," is the inscription in letters of gold on a background of white marble over the entrance of this unique hospital. Three large four-story buildings, new and well-equipped with the latest scientific apparatus in laboratories, hospital wards, lecture room and library, are here frankly dedicated to the elimination of those diseases peculiar to industrial employments. Already twelve scientific men are co-operating with the director, Dr. Devoto, although the laboratories were not opened until March 20. In one of the hospital wards the director is giving special attention to fourteen patients. One of these, a man trembling with the peculiar palsy due to mercurial poisoning, began work in a hat factory when ten years of age and felt the effects of the poison almost immediately. Another patient suffers with "lead colic", the result of his work as a house painter. Seven of his thirteen children died during the

WHERE ITALY LEADS.
The first clinic for industrial diseases, recently dedicated at Milan.

first few months after they came into the world, on account, perhaps, of the presence of poison in the father's system. Other patients are being treated for ills occasioned by work in high temperatures, in dusty or poisonous atmospheres, and for the results of overstrain.

The laboratories, too, are fully equipped. Here we find treadmills in which dogs patiently trot up endless hills in order that their blood corpuscles may disclose new truths concerning the toxin of fatigue. Machines register on revolving discs the fluctuating curves inscribed by long series of muscular strains, in order that the effects of overwork and artificial stimulus may be correlated with immunity from disease. Here, too, "leaded" mother goats and guinea pigs add to our fund of knowledge concerning the effects of lead poisoning upon premature birth and the supply of mother's milk.

These experiments, moreover, are of much more than ordinary laboratory interest. A practical provision extends the activities of the clinic into industrial establishments, and supplements the work of government factory inspectors. Dr. Carozzi, who has devoted much time to this important work, is fully supplied with portable air-test devices. When called upon by the department, he is authorized to enter establishments to inspect sanitary conditions.

These practical experiments, carried on with a broad scientific devotion to the conservation of human resources, offer both encouragement and reproach to us in the United States. What have we of equal value to offer the sons and daughters of Italy whom we invite to our shores? Country dentists have confessed to us that they were merely "experimenting" with match factory employes afflicted with the dreadful "phossy jaw". Industrial diseases of many kinds are leaving pitiful wrecks to burden and shame us. Is it not a matter of reproach that it was not in weary, smoke-begrimed Pittsburgh, nor amid the textile mills of New England, nor among the mines and smelters and factories of the great industrial centers of the United States, but beneath the sunny skies of Italy that this need found tangible expression in the first clinic for industrial diseases?

When Florence Nightingale and Henri Dunant saw the battlefields strewn with dead and wounded, they gave a moment to thought, and then passed on to the world an idea which grew into that beneficent organization known as the Red Cross. Since that time, wherever men might be injured in the activities of war the means for quick relief have been supplied. During that same half century, however, the industrial field with its activities of peace has extended and grown more mechanical, until it now maims more men than war ever did. In the United States we are just beginning to realize that 30,000 wage-earners are killed by industrial accidents every year, and that at least 500,000 more are seriously injured. And now, carefully prepared by a committee of experts appointed by the president of the Association

for Labor Legislation and thoughtfully received by the president of the United States, comes a Memorial on Industrial Diseases,[1] which discloses industrial injuries of still greater magnitude. In this admirable memorial of facts and figures we learn that in the United States there are probably not less than 13,000,000 cases of sickness each year among those engaged in industrial employments. The money loss each year (for those who find dollars more impressive than lives) is calculated by these conservative experts as nearly three-quarters of a billion dollars. At least one-fourth of this painful incapacity for work and consequent economic loss, we are told, can be prevented.

Germany has gathered and displayed in special governmental institutions the latest devices for preventing accidents and disease in workshops. These suggestive permanent exhibitions rank among the interesting museums pointed out to the stranger. And it was only yesterday that Germany among nations nosed into the industrial class. In Minnesota and Wisconsin we are tardily securing the attention of the state to this important subject and are gradually building up permanent exhibits on that sure and effective foundation.

But in the United States we need an institution that will correlate the experience of our scattered little group of hygienists and enable more medical men to direct their attention to the problems of industrial hygiene. We need for the purpose a special laboratory and hospital to accelerate progress in the study of the causes and prevention of industrial diseases. With such an institution, phosphorus poisoning would quickly disappear from our match industry as a matter of scientific common sense. The long list of poisons affecting scores of different occupations would gradually be shortened. Conditions which lower vitality, lessen efficiency and invite disease, would quickly be improved to the advantage of manufacturer and wage-earner. The necessary research would be carried on by scientists of unquestioned ability and singleness of purpose, and in a manner which would enlist from all the heartiest co-operation.

For the past two years the American Association for Labor Legislation has had an able commission on industrial hygiene, and last June we held our first American Congress on Industrial Diseases. As an outgrowth of that congress a committee of experts has submitted to the president a memorial calling attention to the urgent need of a national investigation. The most valuable aid in such an inquiry would be an American clinic for the study and prevention of industrial diseases.

BOOKS FOR SOCIAL WORKERS

LILIAN BRANDT, Department Editor

THE RURAL LIFE PROBLEM OF THE UNITED STATES. By Sir Horace Plunkett. New York. The Macmillan Company. 1910. Pp. 174. Price $1.25; by mail of THE SURVEY $1.33.

In this book, to which one of our esteemed contemporaries alludes as "one of the new nature books", Sir Horace Plunkett has amplified the five articles contributed to the *Outlook* under the title Conservation and Rural Life. With his remarkable success in helping Ireland to solve her own rural problems, and with his ten years' experience as a ranchman in the foothills of the Rockies and an "annual holiday" in the States for the last twenty years, America could hardly find a more competent observer and adviser. What is needed in the country, he thinks, is "better farming, better business, and better living", to all of which co-operation is the first essential. To secure these desiderata he urges the creation, or the development out of existing organizations, of two bodies—a "popular propagandist association" and a "scientific, philosophic, research-making" institute; and he advises with a sagacity that belies his claim to being "an unwilling politician", that, "since the one idea has caught on while the other lags", the "Country Life Wagon" be hitched to "the Conservation Star."

[1] A review of this memorial will be published in an early issue of THE SURVEY.

THE LIFE OF DANIEL COIT GILMAN. By Fabian Franklin. Dodd, Mead and Company. New York. 1910. Pp. 446. Price $3.50; by mail of THE SURVEY $3.67.

This story, succinctly and interestingly told, is full of inspiring suggestions. Dr. Gilman's statements of principle and outlines for action are masterly in their brevity, pointedness and practical wisdom. Most of them relate to education, but many apply equally to other social problems. The common welfare was his absorbing interest. He gave himself unceasingly to the development of society and of individuals. His keen insight discovered directly what was valuable in whatever and whomever came before him. The motto he chose for the Johns Hopkins University, "The truth shall set you free", expressed a sentiment that was fundamental through all his life. He believed in seeking and following the truth boldly, as well as in caution against half truth.

Few men have served their country in as many different capacities. Besides his work as builder in two universities and the Carnegie Institution, he was a member of the Slater, Peabody, General Education, and Russell Sage Foundations, president of the National Civil Service League, member of the Venezuela Boundary Commission, member of the Charter Commission of Baltimore in 1897, president of the Charity Oragnization Society of Baltimore, as well as a member of boards of other important institutions. He identified himself thoroughly with local interests wherever he went. One of the chief merits of the Hopkins University has been its fine influence in widening the outlook and raising the public standards of the people of its city.

OPEN AIR SCHOOLS. By Leonard P. Ayres. Doubleday, Page and Company. New York. 1910. Pp. 170. Price $1.20; by mail of THE SURVEY, $1.32.

The little red schoolhouse has grown up with the cities into a big brick hothouse, with plenty of steam heat, as is natural and necessary in a forcing plant, whether it be for ripening tomatoes in January or adding the latest frills to the Three R's. So it is a most wholesome thing that Dr. Ayres has brought between covers the good and sufficient reasons for reverting to the open-air school, which may be anything from a class out under a tree in the summer to an old building with the sunny side ripped out in the winter.

There is nothing new in the book, as he frankly says. A few reports from Germany, England and America, and articles in THE SURVEY and the *Journal of the Outdoor Life*, give the groundwork. The tuberculosis societies have pioneered the movement in this country, but it is too big and important for them alone. As Dr. Ayres puts it, these schools mark "one long step toward that school of the future in which the child will not have to be either feeble-minded or delinquent or tubercular or truant to enjoy the best and fullest sort of educational opportunity." Here, as in so many school matters, the abnormal or subnormal child has opened the door—and the windows—for the normal. In open-air schools, or open-air-recovery-schools as the Germans, their inventors, call them, pre-tubercular and anaemic children show improvement nothing short of marvelous in physique, school work and deportment. If the sick youngsters do that, the well may do even more

Besides the historical and descriptive chapters there are other very practical ones on Feeding, Cost, Construction and Clothing, and Forms for Record-keeping.

THE AMERICAN RURAL SCHOOL. By Harold Waldstein Foght. New York. The Macmillan Company. 1910. Pp. 361. Price $1.25; by mail of THE SURVEY $1.37.

This book—the first comprehensive treatment of its important subject of which we know—is "affectionately dedicated" to "the thousands of conscientious hard-working teachers who are devoting their best energies to prepare our twelve million country boys and girls for useful citizenship." It should help them materially, both by the suggestions it contains which they can themselves apply, but still more by the influence it should have on school boards and other authorities who shape the conditions under which they work.

The underlying idea is the same one that pervades current discussion of city schools, that the school should fit the child "for life", but in this case "for sane, wholesome lives on the farm—the only normal American life of our day." It is easy to agree with this, without stopping to argue against the qualifying phrase at the end of the sentence, or against the assumption that city life is "terribly devitalizing," and to follow with interest the very concrete discussions which make up the bulk of the book: problems of organization and administration, maintenance and supervision, training of teachers and their salaries, architecture and equipment of buildings, curriculum, affiliated social activities, and at the end a page and a half of "simple rules by which to recognize symptoms of some common diseases."

VOCATIONAL EDUCATION. By John M. Gillette. American Book Company. New York. 1910. Pp. 303. Price, $1; by mail of THE SURVEY, $1.09.

Mr. Gillette allies himself with those who would begin training a child for "his niche in life" at the age of twelve. "If the very constitution of this social world which environs him demands that the individual shall be specialized in terms of its nature, which in my estimation is the case, then the specializing of the child to meet the terms society imposes is the dominant thing. This is the great goal of education."

Does, however, the socialization of education mean the "vocationalization of education"

for the child of twelve? This assumes that at twelve the child will, or must, know what his vocation is to be. It assumes also a far more static condition in industry than the facts warrant at a time when all sorts of occupations are passing through kaleidoscopic changes.

The practical suggestions for the reconstruction of certain school subjects, in Methods of Socialization, are the most valuable part of the book.

THE MAKING OF A TRADE SCHOOL. By Mary Schenck Woolman. Whitcomb and Barrows. Boston. 1910. Pp. 101. Price 50 cents; by mail of THE SURVEY, 54 cents.

Sincere gratitude is due Mrs. Woolman for putting into shape the experiences of the Manhattan Trade School—the problems encountered in the eight years of its existence under private auspices, and the methods adopted to meet them. Unfortunately the account is marred by careless writing here and there: *e. g.*, "Others (other trades) were not chosen, as there was little chance in them to rise on account of men's trades intervening."

MEDICAL EXAMINATION OF SCHOOLS AND SCHOLARS. Edited by T. N. Kelynack, M.D. London. P. S. King and Son. 1910. Pp. 434. Price $2.43; by mail of THE SURVEY $2.63.

Dr. Kelynack seems to have a confirmed habit of getting out such volumes as this—compilations of papers by well-known authorities on various aspects of a general subject. It is not a wholly satisfactory method of book-making, from the public's point of view, for it always involves hiatuses, divergences, inconsistencies, and repetitions in the development of the subject, though on the other hand each chapter can, in such a book, be the work of an expert, as in this case the editor claims.

The aim of this collection of thirty-two papers is stated, in labored phrases: "To provide a complete guide for school medical officers, and to afford educationalists and all interested in the welfare of the school child with a reliable and authoritative exposition of the methods and means whereby the best use may be made of the machinery at present available."

Chapters are devoted to the methods used in Canada, Australia, New Zealand, the United States (contributed by Dr. Gulick and Dr. Ayres), Germany, France, Norway, Sweden, Denmark, and Switzerland, with one on physical education in American universities.

CHILDHOOD. Edited by T. N. Kelynack, M.D. Charles Kelly. London. 1910. Pp. 151. Price, limp cloth, 32 cents; stiff cloth, 48 cents. Not on sale in America.

This compilation is the second of the National Health Manuals, the first of which was concerned with Infancy. The series represents a laudable effort to furnish trustworthy literature at popular prices.

The normal growth of children, their psychology, physiology, diet, diseases, moral training, protection against cruelty and care in dependence, are treated in brief essays, each one prefaced by a page of quotations from the poets and philosophers of the world and the ages.

THE VAGRANCY PROBLEM. By William Harbutt Dawson. London. P. S. King and Son. 1910. Pp. 270. Price $1.20; by mail of THE SURVEY $1.28.

Mr. Dawson's uncompromising contention is that "society is justified, in its own interest, in legislating the loafer out of existence, if legislation can be shown to be equal to the task."

Twenty years ago Mr. Dawson first called attention to the continental detention colonies and labor houses which he still considers the foundation of a rational treatment of the "social parasite." Ten years ago he outlined a comprehensive plan for dealing with vagrancy in England. Two features of it—the establishment of public Labour Registries and the prohibition of child vagrancy—he has recently seen put into effect. This volume, therefore, concentrates attention on the disciplinary institutions which have been found feasible and salutary in Germany, Switzerland, Belgium, and which Mr. Dawson thinks should be substituted for the "casual wards" of England. To provide for the bona fide work seeker, for whom the casual wards are equally unsuited, he urges "wayfarers' hostels" affiliated with the Labour Registries.

1911 CALENDAR OF CONFERENCES

INTERNATIONAL

International Congress on Tuberculosis. September 24-30. Rome, Italy. Secretary-general, Professor Ascoli, Via Lucina, Rome, Italy.

International Prison Congress (Quinquennial). London, 1915. Secretary, F. Simon van der Aa, Groningen, Holland.

NATIONAL (NEW)

Conference on Vocational Guidance, November 15-16. Boston, Mass. Secretary, James A. McKibben, Boston Vocation Bureau, 101 Tremont street, Boston, Mass.

American Society of Sanitary and Moral Prophylaxis. Second Thursday in November, December, February, and April. New York, N. Y. Corresponding officer, James Pedersen, M.D., 29 West Forty-second street. Subject of Meeting of November 10: Clause 79 of the Page bill.

American Academy of Medicine. Midyear meeting, December 1-2, Buffalo, N. Y. Annual meeting, June 24-26, Los Angeles, Cal. Secretary,

THE COMMON WELFARE

GARMENT WORKERS' STRIKE IN CHICAGO

A strike of garment workers in Chicago, which was started about seven weeks ago by twenty workers in one shop, has spread now to nearly 40,000. Although the employers insist that there are no real grievances and that intimidation is responsible for the large numbers who continue on strike, it seems clear that no such rapid, spontaneous and enthusiastic enlistment of working people in a long, hard struggle could have come about without general discontent over work conditions in the trade. The grievances concern various questions of shop control, in regard to fines, overbearing foremen, speeding up and wages—especially the way in which the amount of earnings is calculated. The lack of any way to present grievances, except at the personal risk of an employe, was a complaint common to all the shops.

Further indication of the spirit of the strikers is afforded by the summary way in which they turned down an agreement into which their leaders, both local and national, were willing to enter. This proposed agreement provided for the return of all former employes without discrimination because of their affiliation with the United Garment Workers of America, and for the selection of one person by the employers, one by the United Garment Workers, and a third by these two, to take up the alleged grievances and to devise methods both as to redress and the avoidance of like difficulties in the future. It was specifically stated, however, that this should not be considered as a recognition of any union; that the question of union or open shop should not be submitted to or decided by the committee, and that the open shop should not be considered as a grievance. This document was signed by President T. A. Rickert of the Garment Workers of America, and by the firm of Hart, Schaffner and Marx in whose shops the strike originated. It was felt that a settlement with this concern, which has 10,000 employes, would lead to a general settlement. Meetings of strikers on the same day overwhelmingly repudiated the proposed agreement because of its failure to provide for collective bargaining of any sort and for the closed shop, which the workers finally demanded.

When the strike assumed large proportions a citizens' committee organized "to investigate the grievances and if possible to remedy the situation." Emil G. Hirsch was chosen chairman and Anna E. Nicholes, secretary. The other members are: Jane Addams, Mr. and Mrs. T. W. Allinson, Grace Abbott, Mrs. Joseph T. Bowen, S. P. Breckinridge, Dr. Henry B. Favill, Prof. Ernst Freund, Luke Grant, Alice Hamilton, Mrs. Charles Henrotin, the Rev. Jenkin Lloyd Jones, Sherman C. Kingsley, Judge Julian W. Mack, Prof. George H. Meade, Allen B. Pond, Father Spetz, Rabbi Joseph Stolz, Dean W. T. Sumner, Graham Taylor, Mrs. Harriett Van der Vaart and Mrs. M. H. Wilmarth.

A sub-committee consisting of Professor Meade, Miss Breckinridge, Miss Nicholes, Professor Henderson and A. A. McCormick was appointed to investigate the grievances. Its report consists of a statement of certain points with reference to the character of the trade, a statement of the grievances as learned through interviews with strikers gained by the department of social investigation of the School of Civics and Philanthropy, a report of interviews with three men identified with the clothing manufacturers, and the conclusions of the committee.

SWEATSHOP TO FACTORY

Until recently, the trade was characterized as entirely unorganized from the technical as well as from the industrial standpoint. There has been an effort by Chicago dealers, notably by Hart, Schaffner and Marx, "to regularize the employes in well-appointed factories and

work shops." In health and physical equipment this marked a notable advance. But this sudden transfer of workers from their homes to well-equipped factories, however, with great sub-division of labor has involved economic and industrial weakness in the position of the workers. The seasonal character of the trade was emphasized, and it is stated that the burden and costs of this are shifted to the shoulders of the workers. "The demands of common justice would require the assumption of a larger share of this risk by the manufacturers to whom the profits of these undertakings accrue." It is pointed out that the industry depends upon recent immigrants almost wholly for a large number of processes. They are especially helpless and in need of protection.

Concerning grievances, the strikers interviewed represented the employes of seventeen firms in addition to thirty-one out of the forty-nine shops under the control of Hart, Schaffner and Marx. Fines and deductions are a frequent source of complaint. Loss of spools, bobbins and needles may reduce earnings, and it is even complained that there are charges for the use of soap in the washroom. Deductions are made for small pieces of cloth in addition to the piece given to the cutter as just large enough for a suit. The workers claim that they are sometimes compelled to purchase garments at retail prices if there are slight imperfections in the workmanship. It is alleged that increase of speed or complexity of work is not accompanied by an increase of pay, and there is a general belief that certain employes receive secret inducements to act as pacemakers.

In the relation of foremen with employes, a chief difficulty alleged is that the pay of foremen is in some degree determined by the amount of work or the economy secured in their department. Incessant small friction between worker and foreman doubtless accounts for much of the feeling now manifesting itself, hitherto without any natural channel of expression. Typical of these difficulties is the loss of time, and therefore a lessened wage for piece workers, when it is necessary to hunt for the foreman in order to secure a pass to leave the workroom.

The strikers claim that the efforts of the employers to regularize the work are due to a desire to be more advantageously placed when the rush season begins. They resent the necessity during slack season of spending the whole day in the shop when they are able to work and draw wages during only a portion of it. Time clocks are often subjects of grievance, and some workers say that if they forget to punch the clock their time pay is refused them although their work tickets show that they have been working.

Apprentices, who the strikers say are trained to be fast rather than skilled workers, are looked upon as a labor supply designed to replace older, more skilled and better paid employes.

With reference to wages, in addition to the ways of reducing them already mentioned, there is complaint of the methods of calculating earnings, no system having been developed which enables the workers to estimate their earnings or correct the estimate of the employer. Fines, often listed as "merchandise," make a difference between what workers expect and actually receive.

All three of the men on the employers' side who were interviewed—Harry Hart of Hart, Schaffner and Marx, Harry Pflaum, president of the Wholesale Clothiers Association, and E. J. Rose of the National Wholesale Tailors' Association—insisted that none of their employes has had a real grievance. Mr. Hart said that his employes were free to express their own grievances to him or to the other members of the firm, and that the fact that they did not was sufficient evidence to him that they had no serious grievances. He declared that the strike was fomented by agents of the union who had taken advantage of a small walk-out, due to a misunderstanding, and reiterated his insistence that most of the workers stayed out only through fear of violence. The attitude of Mr. Pflaum and Mr. Rose was substantially the same. They admitted, however, that foremen might be brutal and inconsiderate, and also that some form

of organization within the shops would be useful in giving expression to grievances and leading to their correction. Mr. Hart added that the strike might be a blessing in disguise in bringing attention to evils of which they did not know and which might be corrected.

FINDINGS OF THE CITIZENS' COMMITTEE

The conclusions expressed by the citizens' committee are that the present contract system does not differ materially from the sweatshop in principle, and that in passing from its original sweatshop condition into a factory condition, there are still present in the clothing trade, even in the highly organized factories of Hart, Schaffner and Marx, many of the social conditions which belong to the sweatshop. The committee states its impression that the shop procedure results in unwholesome methods of speeding up, and that the foremen and inspectors naturally give their first and every interest to increasing the efficiency of the operatives even to the point of physically injuring them. The strike is felt to have been made possible by the continued irritation arising from conditions in the shops, there being little evidence that it was due to organized labor. While there is evidence that many operatives have been induced to remain away from shops through fear of violence, the committee does not believe that so large a number could have thus been kept out. The committee believes that

> the natural method of removing the causes of irritation and of making more healthful social life is some form of organization among the workers in the shop. The industry is so very complicated, the labor so highly subdivided, the dependence, as yet, of the operatives upon the foremen is so great, that it seems next to impossible to bring about normal conditions unless the operatives themselves are able to express their own views and their own complaints through committees and thus without fear of the loss of position or of the enmity of the foreman.

Such representation seems necessary also as a protection for the many immigrants whose skill and knowledge of American conditions is not yet sufficient to enable them to protect themselves. The report concludes:

> There seems to be no manner in which the firm can insure itself against the recurrence of such disturbances except by instituting some system of dealing with their operatives through representative committees or other forms of of shop representation.

The Women's Trade Union League, one of the participants in joint conferences—which include representation from the national executive committee of the United Garment Workers, the local union, the strikers' committee and the Chicago Federation of Labor—has also issued a statement covering many of the points which appear in the statement of the citizens' committee. The league specifically states, however, that through various methods the reduction in wages has amounted to from fifteen to twenty per cent. Incidentally, it gives the interesting information that there are fifty-six divisions in the manufacture of a pair of pants, over sixty for a coat and twenty for a vest. The statement concludes with a strong declaration that the only practicable and effective method of collectively presenting grievances and securing protection is through trade union organization. The league is maintaining three commissary or lunch stations, one in each section of the city especially affected by the strike.

With the strong endorsement and active support of the Chicago Federation of Labor, the striking employes both in and outside the garment workers 'union, have united in presenting to the employers, through National President Rickert of the Garment Workers, the following demands:

> (1) Only members of the union to be employed in the cutting and manufacturing departments.
>
> (2) A week's work for all cutters and trimmers to consist of forty-eight hours, and for all tailors fifty-four hours; overtime work to be paid at the rate of time and one-half, and double time for holidays.
>
> (3) Any misunderstanding as to wages and other working conditions in any shop shall be referred for adjustment to the firm and the shop steward of the union, and if they cannot adjust it, then it shall be submitted to a third party mutually agreed upon between the union and the firm.

CLAUSE 79 OF THE PAGE LAW

Clause 79 of the Page Law on Courts of Inferior Jurisdiction in New York city was discussed for three hours last week at a meeting of the American Society of Sanitary and Moral Prophylaxis and at the end, as at the beginning, the audience was divided sharply into two groups—those who find it the first step into the European system of regulating and licensing prostitutes, and those who find it the first step toward a better protection of public health and morals.

Segregation of prostitutes as a means for reducing syphilis was first proposed in the fifteenth century when, as Dr. Prince A. Morrow, the president of the society, recalled, certain learned men declared, in the quaint phrase of that day, that the disease could readily be cured if the infected women were set apart and treated by chirurgeons by authority of the princes temporal and princes spiritual and the Grace of Almighty God. The women have been set apart and treated with varying degrees of thoroughness—and today we have syphilis and gonorrhoea in every part of the civilized and uncivilized world—the white man's burden freely carried over to the heathen, be it noted—to a degree never before known. As an integrate and ineradicable part of this method, we have, as our twentieth century science tells us, babies blinded, girls ruined, boys debauched, women surgically mutilated, men crippled for life and work, and an annually recruited army of paretics in the insane hospitals. It is high time, Dr. Morrow and his associates hold, that we throw overboard a theory based on the belief that sexual intercourse is a necessity for men, and therefore to be safeguarded; and a practice based on the treatment and the punishment of the woman, who has been forced into prostitution through the lust of men and the pressure of man-made economic conditions. Self-control, a single standard of morals, punishment of men as well as of women who transgress the moral and the statute law, sex education for boys and girls, frankness of speech, publicity, a general knowledge of the harvest as well as of the sowing of wild oats—that is the platform of the American Society of Sanitary and Moral Prophylaxis.

Those who differ with Dr. Morrow on the specific issue of Clause 79—and it is fair to note that many of them agree with his whole general program—find that clause not a beginning of state regulation and licensing of prostitution, but a measure for substituting hospital treatment for jail treatment of diseased prisoners and a valuable supplementary factor to his campaign. The wording of the statute, they hold, bears them out, for the medical inspection applies only after conviction, while the European regulation systems invariably give power to the police to have examinations made of any women whom they may believe to be prostitutes. It is, they contend, in very truth a first step, making toward medical examination of all prisoners; finger print records of all convicted persons in order that probation, or reformation, or permanent segregation, may be applied as needed; and, so far as prostitutes are directly concerned, removing from the streets at least a few of the diseased women. They are convinced that there is a gain in every street-walker torn from Broadway, for not only is she denied this easiest and freest possible commerce with the man who seeks her, but she is removed from active solicitation of boys returning from the theater or any innocent evening amusement.

TWO SIDES OF A QUESTION

There are the two views. As Dr. Morrow said, the society seldom expects to convince anyone of anything when it is discussing mooted questions. But it believes the discussions are worth while, nevertheless, for frank discussion is the only possible solvent for divergent views, and as it seeps down through the laity it starts more and ever more discussion and thus aids mightily in that education of the general public which, after generations of false silence, is so important.

Not the least interesting part in the discussion was that taken by the women. Without a place on the program, although they formed three-quarters of the

audience; with no chance to speak until a motion to adjourn was before the meeting, they nevertheless made an impression on all who were present. Moral fervor is greater than parliamentary usage.

The arguments against the bill were presented by Dr. Morrow, in a paper which carried weight not only because it was by the foremost American authority on venereal disease and the author of the standard work on the subject,[1] but because of the evident care in its preparation, the temperate language and the orderly array of argument. This clause of the Page law comes within the scope of the society, he said, for the society's specific object is to check the spread of venereal disease and the essential intent of the law is sanitary. In that it is unique, for all previous American legislation on the social evil has ignored these diseases. The question is, does this represent advanced legislation, or is it the entering wedge of regulation in the European sense? There is no suggestion that the law is reformatory in its purpose, although the women caught under this law are probably the debutantes of vice, for all medical history shows that it is the youngest who are most diseased. The law is clearly not in the interests of the women; it is evidently in the interests of the men these women might infect. That is class legislation, directed against a particular class of women in favor of a particular class—a licentious class—of men, though the members of the Page Commission had no such end in view. Such disease can be contracted only by seeking it. Should the state protect the men who seek it?

The argument that the number of foci of disease present in the city at any time will be reduced by the number of diseased women then in hospital, will not hold, he said. The supply of contagion is constant, for the demand for prostitutes is constant. Those in hospital will be immediately replaced by a fresh supply who will themselves become infected, and when the first are released there will be a larger number than ever.

[1] Social Diseases and Marriage. By Prince A. Morrow, M. D. Lea and Febiger, Philadelphia. Pp. 380. By mail of THE SURVEY, $3

With the practical working of the law, he took strong issue. The evidence upon which conviction rests is in the hands of the police who are not fitted to give it, he said. Sentence to a hospital and discharge from it depend on an examination by a doctor stating that the woman has or has not venereal disease —"making a demand which it is beyond the power of medical science to give," for only the most virulent cases of gonorrhoea will be caught, while the deep-seated but equally infectious cases will escape detection. The most that the hospital can hope to do in so short a term is to whitewash the case—clear up the obvious symptoms. That is no protection to the men who patronize the woman after discharge. Moreover, every woman discharged will be held by an ignorant public to be safe.

To those who ask why not try the law out, his reply was that it has been tried out for a century in Europe and condemned by its practical results.

ALL ARE EQUAL BEFORE INFECTION

Since segregation and medical treatment were first proposed in the fifteenth century, the masculine spreader of contagion has been practically ignored. The whole blame, he said, has been laid on the woman. Yet the male is the disseminator and the cause of the social results which are the most serious. The prostitute is the purveyor. In the field of immorality she is the more active, but she is confined to that field, while her partner takes the disease home to his wife and children.

So, he held, to lock up the woman, to isolate one factor and leave the other free, would be a satire on sanitary science. It would be an attempt to create a double standard of sanitation which is impossible, for science recognizes the absolute equality of all before infection. There should be equality of responsibility as well.

His proposal of reform, with which he closed, was for obligatory notification of the venereal diseases, like tuberculosis and smallpox, to the health authorities, under specified conditions; and the wid-

est possible publicity of their consequences in order to create public opinion in favor of the sanitary measures deemed necessary for their effective control. The need is for general enlightenment and antiseptic publicity. He was heartily applauded.

Homer Folks, secretary of the State Charities Aid Association and president of the State Probation Commission, made the chief reply. Social as well as medical factors are involved, he said. The crucial point in regard to Clause 79 is, is it a regulation of the social evil? If it is, he is against it without further argument, but he can find in it no features common to the regulation acts abroad. It appears to deal only with a small number of persons—those arrested; and of those arrested, only with those convicted; and of these it proposes to segregate for a time the ones found to be diseased. Is that a regulation of prostitution, or is it a measure for public health and morals? It cannot possibly be regarded as a comprehensive plan to treat the social evil.

Mr. Folks's point of cleavage with Dr. Morrow—and as a social rather than a medical point, he claimed the right as a social worker to present and maintain it—is whether the number of active foci of disease will be reduced by segregation of diseased women after conviction. To him it seems almost an arithmetical proposition. He does not believe that the demand will remain the same.

> I believe that the demand is in an appreciable degree dependent upon the supply—the number of women actually on the streets soliciting and thus actively creating the demand——and that every removal from that number is a removal of demand as well as of supply. I favor Clause 79 because it removes women who are otherwise foci of infection. It reduces the incitement to the demand and so reduces that demand itself. It does not discharge the non-diseased. They are left under conviction and subject to just the same penalties as they were before the Page law was passed.
>
> I will stand for the most stringent law for the segregation of diseased men, too. But will some one tell us how, when, and where we can get hold of them?
>
> A law cannot be condemned for the good things it does not do, if the things it does do are valuable. The administration of the Page law to date has been faulty, and commitment should not be to the workhouse, nor even to a well-equipped hospital, but to a reformatory with adequate hospital features. Dr. Morrow is right in urging an educational campaign. This law is not a substitute for such a campaign and does not stand in the way of it.

In closing, Mr. Folks said, referring to Rabbi Harris's criticism that the Page law is not a comprehensive handling of the subject, that he had given up trying to get all the reform he wanted at one time. The only way to progress is to get what you can, and then get some more, and again some more. "If this law is good as far as it goes, and is impartially enforced—then I will go ahead with any others to get more of the progressive things that this law is criticised for not doing."

There was a hearty round of applause when Mr. Folks closed.

Rabbi Maurice H. Harris, speaking on the moral aspects, got into a position of opposition to the single standard of morals that to many of his hearers was unconvincing. A number of others spoke briefly. Dr. John S. Billings told of the arrangements for medical examinations which the Department of Health has made in accordance with the provisions of the law. Only one woman of 168 convicted has objected to examination. Gonococci were found in fifty-nine, or thirty-five per cent.

Julius H. Mayer, counsel to the Page Commission, who had been the opening speaker on legislative aspects, was given an opportunity to close the discussion. The bill, he had said, was not new legislation on the general subject of prostitution, but a development upon the existing laws which run back to 1833. The failure to make Clause 79 apply to men who live on the earnings of prostitutes was purely an oversight due to the great number of points and laws to be considered. He could only see objection to Clause 79 on two grounds. The first was a fundamental objection on the part of some to any legislation whatever on the subject. With that view he could see no use in arguing. The other objection was upon specific phrases or upon administration. On that he urged time to see what some of the results are. "We

must confer and co-operate and work it out together", he said. In the time allotted to him he had not given anything like an adequate description of the law or of the commission's reasoning in drafting it, but urged his hearers to read the report of the commission. In closing, he repeated a plea for a fair trial. It was not in any sense a complete measure, but a first step. Let it be tried out practically and made the basis for further steps.

"FIRST STEP" TOWARD WHAT?

Then, with the chairman's gavel raised to declare adjournment, the women took a hand. By his use of the phrase, "a first step," Mr. Mayer had given the cue to their chief contention—that medical inspection under Clause 79 is essentially regulation and the next step will be licensing. Twenty women were on their feet, claiming the floor. Finally one of them put the question that was on every tongue. Would the gentleman state what, if he had the power, the next step would be? He had not the power, he said—that lies with the Legislature—but if he had the power he was frank to confess he had no next step. He had done his best in the Page law.

One woman after another got the floor and in explosive phrases told the tale that Dr. Morrow had put dispassionately. As discussion it was emotional and incoherent, but it struck home to many as evidence of an absorbing moral fervor. Under it all lay a sex-consciousness of deep wrongs suffered by women, a storm of protest that has been gathering for centuries and is wreaking itself pell mell on what they regard as a "hypocritical and pharisaical law."

Finally, Lavinia L. Dock, secretary of the International Council of Nurses, got to the platform and flayed the law and its makers in stinging phrases, amidst bursts of applause. She challenged the wisdom and the sincerity of its supporters and the "weak excuse and feeble argument" of the "philanthropists who had failed to enforce the old law." Much had been said of soliciting by women, but nothing of soliciting by men, she said. Let any girl ordinarily protected by good clothes and a good neighborhood put on the clothes of a working girl and go to a factory. She would find that solicitation of women by men went on unceasingly wherever girls work for a living. The essential characteristic of state regulation of prostitution, the core and essence of the whole thing, she said, was the enforced medical examination and compulsory treatment. All the rest is unessential. Take the medical examination away from foreign systems of regulation and see what is left. Clause 79, she said, has not the slightest tendency toward minimizing prostitution. Let the money and machinery wasted on it be applied to enforcing existing laws which are now notoriously not enforced. She left the platform in a storm of applause and congratulation by her supporters, and the meeting broke up into little groups to carry on the discussion indefinitely.

To an outsider, it appeared that the evening was spent more in considering the general question of the social evil than the Page law. Dr. Billings's figures were the only statistics offered on its operation and Mr. Folks was the only one who spoke on actual administration. There was no evidence by judges, probation officers, police, matrons, examining physicians or any of the officials engaged in the actual administration of Clause 79. Sources of direct information were present, but unheard from, in a police magistrate, a former executive secretary of the Committee of Fourteen, the first woman probation officer at the Night Court, the secretary of the New York Prison Association, officers of the new Committee on Criminal Courts, and the director of the Rockefeller Institute, which is experimenting with the Ehrlich discovery for syphilis, which had not even been mentioned. A later meeting, on the same subject, which was proposed, may include them.

OPENING UP A WIDE FIELD

The discussion of Clause 79 has thus brought the whole subject of the social evil and the venereal diseases to general

attention, and has showed throughout that a public commission which puts through new legislation without calling into consultation the groups of people most interested, will be roundly criticised. Conversely, these groups are put in the difficult and embarrassing position of having to fight a long campaign for revision of a statute which they should have known about and challenged before it was passed, and especially while it was still under consideration by the commission—the report of the Page Commission was widely circulated and the bill was the subject of public hearings. Further, those who believe Clause 79 is the thin edge of the wedge for securing medical examination and finger print records of all prisoners, have found it in fact the large end of the wedge, which is balky about entering backward, after the contrary manner of all wedges. Finally, legislation directed at one sex, however well grounded in legal practice and precedent, will be fought as class legislation.

It has shown, moreover, the prime need for a body of actual fact concerning the social evil in American cities today. The history of European regulation is not enough. The reports of the Immigration Commission, the Committee of Fourteen and the Rockefeller Grand Jury touched single phases. The forthcoming report of the Chicago Vice Commission, a study of things as they are, will be impatiently awaited as the next contribution to the subject and one of national significance.

AMERICAN AND GERMAN STANDARDS OF LIVING

Bulletin No. 88 of the United States Bureau of Labor contains a study of the income and expenditures of 852 families in about thirty cities and rural districts of Germany, with incomes ranging from about $300 to about $1,200, made by the imperial statistical office during the year 1907-8. As Robert C. Chapin's study of the cost of living in New York, based upon 391 family budgets was made at about the same period, a comparison of average percentages of expenditures is not without interest. The first column is a general average from those on page 70 of Chapin.

	Chapin.	German.
Food	44.4	45.5
Rent	21.3	17.9
Clothing	14	12.6
Heat and Light	5	4
Miscellaneous	15.3	19.7

As the percentages for New York families are averaged on salaries from $400 to $1,200, the German percentages cover a slightly wider range. With the exception of food all the special expenditures in New York are higher, rent noticeably so, with the result of cutting down that miscellaneous group which represents the comforts of life.

Both German and American families of different incomes show widely different percentages for special expenditures. Percentages for rent, fuel and light decrease as income increases. For food the German percentage of the maximum income ($1,200) is 30.3 per cent as compared with 54.2 per cent for the minimum ($300), though the money expenditure on the larger income is three times as great; in New York on the other hand the percentage of the larger income is larger, 45.6 per cent as compared with 40.8 per cent for the smaller and this represents a money increase of only between two and three times the smaller. For clothing, those having the maximum income in New York spent less than three times what those with the minimum income expended, while in Germany this class spent nine times as much as the minimum income class.

As to sources of income, the German study shows the fathers of families supplying only 82 per cent of the total family income, the American 89 per cent, the German families showing a much greater percentage of working mothers and both having the same proportion of child workers. Almost one-third of the American and one-half of the German families showed an annual deficit, real in some cases and made up by borrowing or pawning, in others due probably to an understatement of resources in the shape of fees and of gifts from friends. It is noteworthy that a majority of the German deficits are in the salaried in-

come class, that class whose income in all countries is apt to be supplemented by gifts from the surplus prosperity of the wealthy classes to whom it is related.

FIELD SECRETARY FOR HOUSING ASSOCIATION

Systematic and aggressive work throughout the country is to be undertaken by the National Housing Association through a recently appointed field secretary, John Ihlder. For the last two years Mr. Ihlder has been secretary of the municipal affairs committee of the Grand Rapids, Mich., Board of Trade.

The noteworthy civic service of this body has been due in no small part to Mr. Ihlder's earnest and intelligent work. Its first achievement was the securing of a city plan for Grand Rapids. So little did the citizens and officials appreciate the significance of such a plan that a vigorous educational campaign was necessary. This took the form of a "civic revival"—a week of stirring meetings under the leadership of Prof. Charles Zueblin—which attracted widespread attention[1] and has since been iniated by more than a dozen cities.

An enthusiastic civic spirit thus stimulated led to a thorough scheme of committee activity dealing with various phases of municipal affairs, the work being kept constantly before the public so that well informed popular sentiment was rallied. In addition to the civic revival several other departments of the committee's work have become annual fixtures in the life of the city. Among these are an Arbor Day distribution of trees and shrubs, and a milk contest. The committee has co-operated with public-spirited citizens in other Michigan cities to secure the passage of home rule legislation. It took a leading part in Grand Rapids charter revision.

Most effective has been its ability to unite and focus effort on the thing which in the opinion of a representative conference was the most urgently needed next step of civic advance. In this way a large majority was secured in the vote on bonds to provide pure water. Similarly, at the present time civic and social organizations throughout the city have been lined up in a vigorous campaign to carry the bond issue of $200,000 for parks and playgrounds on which the people will vote at this November election.

A score of definite civic reforms or improvements have been agitated or accomplished by the committee, whose work has put the Grand Rapids Board of Trade in the forefront of the business organizations which devote real effort to the general public welfare. Mr. Ihlder's success in helping direct such work by a business organization augurs well for his service in gaining the support of practical men for the movement to secure improved housing conditions throughout the country.

JOINT FELLOWSHIPS FOR SETTLEMENT TRAINING

Believing that the field of social investigation is now thoroughly covered by the Russell Sage Foundation, schools of philanthropy and other like agencies, the College Settlements' Association has decided to replace its fellowships in investigation by fellowships in settlement training. With the co-operation of the New York School of Philanthropy, the Boston School for Social Workers and the University of Pennsylvania a course has been offered in New York and Boston, which will soon be extended to Philadelphia.

This course, which was planned by a sub-committee of the association consisting of Eleanor H. Johnson, Alice E. Robbins and Mary Van Kleeck, includes the full course of lectures in one of the schools and one year's residence and carefully supervised field-work in a settlement belonging to the association. The plan of field work, which is designed to give a clear view of the relation of the settlement to its neighborhood, covers attendance at lectures and meetings on social matters; visits to city institutions; comparative study of the methods of several settlements in the same community; detailed study of some one definite social problem, to be used as a final thesis, as well as practical experience in club work, house duty and visiting. A detailed outline of the plan may be obtained from

[1] See THE SURVEY for December 25, 1909.

Miss Johnson, 37 Madison avenue, or Miss Van Kleeck, 31 Union Square, New York. Fellows have been assigned for this year in New York and Boston, one being a graduate of Wellesley, the other of Smith.

The investigation fellowships have been in existence for twenty years and many of the fellows have made valuable contributions to our knowledge of social conditions. As early as 1893 Isabel Eaton made a study of the garment trades which was published by the American Statistical Association and of the problems connected with the American Negro which was edited by Dr. DuBois. The annals of the American Academy of Social and Political Science published Mary B. Sales's study of housing conditions in Jersey City in 1902. Frances A. Kellor made a study of employment agencies which formed a basis for legislation in New York. Mary Van Kleeck made an investigation of overtime work for women, published in THE SURVEY of October 6, 1906, and of tenement house work, whose results were published in THE SURVEY of January 18, 1908.

Jessie B. Adams's study of the Working Girl in the Elementary Schools in New York appeared in THE SURVEY of February 22, 1908, and Louise Odencrantz's study of Irregularity of Women's Employment, in THE SURVEY of May 1, 1909. Some of these fellows are now doing like work for the Russell Sage Foundation.

CUT THEATER RATES FOR WAGE-EARNERS

The New Theater in New York has set aside certain evenings on which plays with the regular casts are presented to wage-earners at one-quarter of the regular prices. The tickets are distributed through settlements, evening schools, and organizations of workingmen and women. Self-governing branch clubs, to be known as Wage-Earners' Theater Leagues, are being established. Each league has a committee of two to represent it.

Any working man or woman may join a branch league by paying monthly dues of ten cents, which are deducted from the cost of the ticket chosen during the month. The prices for these range from ten to fifty cents.

At the performances already given, the audiences were large and intelligently appreciative, showing there is a very real desire for good drama among those who cannot ordinarily afford to see fine plays. The fact that the settlement workers and club officers attend with those for whom tickets have been procured is some guard against abuse of the privilege.

The first special performance at the New Theatre on October 10, which was of Maeterlinck's Blue Bird, was so successful that the plan is spreading. Oscar Hammerstein has reserved Monday evening for a similar experiment at the Manhattan Opera House. The managers of two other theaters have agreed to set aside their entire houses for special Monday evening performances. The New Theater will even give up a Saturday evening to enable many to come who cannot stay up late other nights. Special matinees of fairy plays are also in store for the children.

The tickets have been distributed mainly among the Jewish factory workers, although any others who belong to certain settlements can secure them. Refined people of the clerical class, particularly women on salaries of from forty to sixty dollars a month, are not adequately provided for in the scheme. This is a defect which the New York *Evening Post* points out in connection with the plan in Chicago, by which three theaters reserve the first Tuesday night of each month as theater evening for business girls.

The People's Institute of New York aims to marshall an audience which can be used to secure better plays for the whole public. It selects certain performances each year. Then arrangements are made by which those who apply by letter and are vouched for by responsible officers of certain associations, after paying a membership charge of a quarter, receive identification cards. These are good usually during the early nights of the week and entitle the holder to a reduction of from a quarter to a half. The idea of bringing

good drama within the range of the wage-earners is quite similar in last analysis to that of creating a larger audience to demand better plays and the two forces should work in harmony.

REPORT ON EQUAL PAY

The New York Commission on Teachers' Salaries, which was appointed by Mayor Gaynor last February, has submitted its findings in 140 pages of material, so bulky that they have not yet been published in full. In the main the report is favorable to the advocates of "equal pay" for women teachers. Much carefully compiled information is given which is of interest to educators throughout the country.

The commission found that while only one-eighth of the positions in the public schools are suited to men, there are more men than women on the waiting list. The proportion of men teachers was found to be greater in the cities where equal pay for the sexes prevails than in those which discriminate. The commission was unanimous in believing that men should be employed in the upper grades of elementary schools and in the high schools.

The commission finds that men do not appear in large numbers below the sixth grade and practically all are employed in teaching boys' classes. In the sixth, seventh, and eighth grades there are 905 men and 789 women teaching boys' classes. Many boys leave the public schools without ever having had a man teacher.

The commission assumes that it is more difficult to teach boys than girls in the two upper grades, and recommends larger salaries for teachers of either sex for this work. For the lower grades and for girls in the last two years the report suggests for both sexes the rates that are now in force for women.

The commission recognizes the evidence on the cost of living furnished by the investigations of the State Conference of Charities in 1906, of the Russell Sage Foundation,[1] and of the Association for Improving the Condition of the Poor in 1907, and finds that $600 a year is not enough even for a beginner. The A. I. C. P. found $600 a difficult wage for a single woman in New York. Instead of a slow advancement every year, it suggested a minimum salary of $720 unchanged for three years. The Board of Estimate and Apportionment has passed a resolution in favor of this change which will take effect as soon as the necessary changes in the Davis law can be made.

Salaries for principals, it is said, should be based solely upon the size of the schools and not upon sex. In the high schools it is suggested that teachers of boys' classes, irrespective of sex, shall be paid more than those who have girls. In order to avoid the multiplication of salary schedules a system of bonuses in addition to salaries is recommended for teachers of classes of mentally defective and backward children and of cripples. It is recommneded that clerks receive a yearly salary of $600 instead of three dollars a day.

The commission believes that the wages paid substitute teachers should be so advanced that "it will no longer be possible to effect any considerable saving by employing the services of substitutes rather than those of regular teachers."

Under the head of "sex comparisons," the commission finds that promotion and attendance on the part of children are practically equal in schools under men and women principals, but that they are slightly better in rooms taught by men. The average woman is absent from duty two and a half times as much as the average man, but women are not tardy so frequently.

The commission consisted of Clinton L. Rossiter, chairman; Mrs. Frank H. Cothren, secretary; Leonard P. Ayres, Lee K. Frankel and James M. Gifford

THE HOUSING PROBLEM OF TWENTY CITIES

The article by Mr. Veiller on another page opens a series of twenty on as many cities which will be published in THE

[1] The Standard of Living Among Workingmen's Families. By Robert Coit Chapin. Russell Sage Foundation Publication. By mail of THE SURVEY, $2

SURVEY once a fortnight. Since the organization of the National Housing Association, for which he was responsible, small but increasing groups of earnest men and women have taken up anew the study of local conditions as the necessary basis for legislation. THE SURVEY is fortunate in securing for its readers the first publication of these studies in communities ranging all the way from tiny villages to New York, Chicago, Philadelphia and Boston. The illustrations will offer significant evidence.

The list of articles, to which there may be additions, is as follows:

The House Awakening, Lawrence Veiller.
The Awakening of a State—Indiana, Albion Fellows Bacon.
Two Million People in Small Houses—Philadelphia, Helen L. Parrish.
Teaching the Tenant, Johanna von Wagner.
Socialists and Slums—Milwaukee, Carl D. Thompson.
A City with 70,000 Earth Closets—Baltimore, J. W. Magruder.
Two Hundred Miles of Alleys—Chicago, Charles B. Ball.
"Romeo Flats"—San Francisco, Alice S. Griffith.
A City of Huddled Poles—Buffalo, Frederic Almy.
Housing Reform in Cold Storage—Boston, Edward T. Hartman.
A City Awake—Detroit, James B. Williams.
American Housing Reformers, Lawrence Veiller.
Housing in Cleveland, Howard Strong.
New Tenants and Old Shacks—St. Louis, Roger N. Baldwin.
The Slum Invasion of a College Town—New Haven, Mrs. Henry Wade Rogers.
The Discoveries of Columbus, Otto W. Davis.
A Neglected Community—Cincinnati, C. M. Hubbard.
Turning Alleys into Playgrounds—Washington, William C. Woodward.
New York—The Pioneer in Housing Reform, Lawrence Veiller.

SEWAGE AND NEW YORK BAY

The letter by Mr. Holmes on another page refers to an article in THE SURVEY of October 8 which was a discussion primarily of the problem, at which New York is now at work, of properly disposing of the sewage of her five boroughs.

A solution of this will obviously be impossible if neighboring communities continue to pollute the harbor. Action by one community cannot solve such a problem; there must be co-operative effort in which all bear their share of keeping clean a body of water which is immediately adjacent to the homes of millions of people. The problem is vastly complicated by the fact that not only numberless cities and towns but two states front on New York bay. It would thus seem to be obviously an interstate question which, as Mr. Holmes suggests, may yet find its way to the United States Supreme Court.

In that case, the mere creation of the Metropolitan Sewerage Commission indicates New York's desire, if not her accomplishment, to appear with clean hands. As things stand, it would seem that if such a case as Mr. Holmes suggests came into court, the burden of proof would inevitably fall upon New Jersey, and that that state would be called upon to answer yes or no to some such question as this: "Have you done everything in your power to purify your sewage which you propose to discharge into a neighbor's front yard, and have you co-operated with that neighbor in devising a comprehensive plan for keeping New York harbor clean and healthful?"

Physicians, engineers, sanitarians and municipal commissions have differed widely as to the standards to be set up and as to the value of the various cleansing processes proposed. The records of inter-municipal relations go to show that if New York, situated at the discharging end of waters which carry the sewage of hundreds of towns, did not set up high standards, her neighbors might gorge her waters with raw sewage. A degree of treatment adequate for today might be quite inadequate tomorrow—or in a few years—with the enormous growth of population in New Jersey and in Westchester county, N. Y. It is easier and safer to demand a comprehensive plan and adequate treatment now than to wait until the harbor waters are saturated. White Plains and other Westchester towns did not project the Bronx river sewer until the river became literally a stench in the nostrils of the commuters. Why ask New York to repeat the experience?

"THE UNENDING MILES."

PASSAGE TO TEXAS

FRANCIS H. McLEAN

FIELD SECRETARY, CHARITY ORGANIZATION DEPARTMENT, RUSSELL SAGE FOUNDATION

There may be a few men who know Texas. Many know parts of it. Even to a Californian, however, its striking and manifold variations are a never ending source of amazement. It is something to have sojourned in it a month and even in that time to have realized the incorrectness of many impressions. Generally it takes longer to relieve one's self of hasty impressions.

Let us see. In that month it took 3,000 miles of traveling to visit six cities. Important as those cities are, their own confusing variation forbids generalizing. Far to the west, scarcely of Texas though in it, is El Paso, up a titanic incline of 619 miles from San Antonio, its altitude 4,000 feet; a desert city of the mountains, with nothing but sand and air which thrill and tingle and colors which intoxicate. Many come for their lungs, come and go; and the permanent group of residents are well within their shells.

At the other end of that incline is San Antonio, green and beautiful, with its memories going back to Lone Star days, now undergoing the pangs of a land boom, with its civilization a mixture of old and new, the gay city of Texas. Still to the east, another half day's journey, is Houston, with something of Atlanta's assertiveness, claiming business primacy with more or less justification. Perhaps a little more southern in feeling is this lower tier of cities, excepting El Paso. El Paso is a reflection of the world. It is not only the Negro who is a separate class, but the Mexican—the Greaser—is to the ordinary inhabitant a being inferior. Then the capital, Austin, where one seems to strike the very heart of Texas: a tight little city of not so many ten thousands, sufficient unto itself, with a generous social democracy which has no counterpart in the other cities. Here is not only politics, but culture, the great University of Texas here having its domicile; or, rather, this is its home address, for ever the university is linking itself to the life of the people of the state.

The Conference of Education and the university have been fighting the battles for primary education and the socialization of the schools through parents' associations. Its law and other professors are furnishing the material for more than one social campaign. Progressive enough to adopt the commission form of government, though a city of but 25,000 or 30,000, Austin is showing what efficiency may be introduced by that system, even in a small city. Clean, generous and delightful is Austin.

Something tells you that you are reaching towards the northern borders when Fort Worth and Dallas are reached. The few railroad lines have merged into many, there are fewer Mexicans, manufactures are on the increase, the population type has become more cosmopolitan than in San Antonio or Houston. Here, too, the growth of the public conscience is apparent, particularly in Dallas. Indeed, in Dallas, and to a slightly less degree in Fort Worth, one realizes that the social problems are keenly felt and that the social agencies have reached a degree of organization quite complex. Situated within twenty miles of each other, they have developed only the most good natured of rivalries.

As to the relations among the five cities, so far as the social field is concerned, there is very little interplay. Here, as elsewhere, the charity organization group has struck up more acquaintanceships, but outside of the State Federation of Women's Clubs, the Labor Council, the Conference of Education people, and the university, very little general knowledge is current of what is happening in the other cities. There has been comparatively little visiting, and excepting in the case of Fort Worth and Dallas, whose interplay is undoubtedly responsible for some of the progress achieved, one has an ever present feeling of isolation.

And having seen these cities, what has one seen of Texas? What of the wonderful Pan Handle country, transforming its pastures to golden-lined crop fields, measuring its expanses by millions of acres? What of the still remaining pastures to the west, in the vast reaches stretching to the desert which encompasses El Paso? What of the glitter and fascination of the gulf cities, indeed, if one confines one's self to centers of population? What of a thousand other aspects of a land whose marvelous diversity of face and clime and geography bewilders?

Once the writer was endeavoring to plan a way of having the question of juvenile probation discussed comprehensively by the judiciary.

"There is the State Association of County Judges," replied a wise judge, "but it is no use your trying to get that before them as a whole."

"Why?" he was asked.

"Because, in scores of counties, some of them without railroads," was the reply, "the county judge is also superintendent of public schools, and does not have to be a lawyer. They are not bothering themselves about public questions, but trying to make their own way."

This brought out, as a mere incidental, the diversities even in agricultural conditions, throughout the state.

November 19, 1910.

BUILT OF RUBBISH

A row of huts near the international bridge at El Paso where the presidents of two great republics met.

So, to speak of Texas as a whole, as a result of even this long journey, is absurd. If one traces the location of the five cities mentioned upon the map of Texas, he will find that after all only a little of the center has been visited with a short trip of 600 miles to the western border. Nevertheless, because these are five of the most important cities, and because there are at least three organizations (already alluded to) which have state-wide affiliations in the social field and whose point of view may be obtained at second hand, and because the results of rural mishandling are sometimes apparent in cities, there are certain problems standing out prominently in these selfsame cities, which are certainly state problems.

There can be no doubt that tuberculosis, both imported and domestic, hangs like a black cloud over Texas. It is extremely difficult, practically impossible, to form any idea of just how serious the situation is; but this is known: that wherever there exists an associated charities, there also exists a feeling approaching despair, caused by facing a situation without facilities to combat it. There is very little provision for sanatorium care; the state regulations for registration and disinfection are variously carried out in the different cities; a traveling exhibit and some few fairly

A HUT OF DIRT AND TWIGS.

About 300 people live here. Light and air come only from the door. The infant death rate is very high. Rent, seventy-five cents a week.

effective local campaigns comprise the sum total of educational effort. Then consider that into this state, which, after all, is just beginning to know itself, there is pouring a stream of unfortunates from other states, fleeing, as they think, to save their lives in this sunny clime. Some do; but they are the ones who have resources. Many others, whose resources are small, through the criminal ignorance and incompetency of local medical practitioners, waste what would go a long way at home toward securing adequate care in coming here to strive and scrimp for a few weeks or a few months, and then collapse. They become public charges. Even then they may become victims of a ghastly comedy, may be shipped from place to place, by public officials, at public expense; shipped wherever their despairing whims suggest; hastened to death, and the public treasury in the end the sufferer.

So far only the associated charities have attempted to send home sufferers of this sort. Public officials in some instances have acted humanely in providing what care they could.

In this chaotic condition Governor Campbell, at the last legislative session, vetoed a measure for the establishment of a state sanatorium, a course in which he was amply justified. The situation demands something far more general than that. Governor Campbell's suggestion that there should be a state tuberculosis commission is, in the writer's mind, the first necessary step. Such a commission should have very wide powers of investigation and recommendation. It will be necessary for it to jack up the local health officials, who are lax, much more abruptly than in the past. It must gather statistics and data of the present extent of the disease. It must very carefully consider the question of a deportation law, or of other measures which will prevent the incoming of those who come only to die at public expense. It must see what system of sanatoriums is best adapted to the peculiar conditions existing in the state, and this with relation to the comparative wealth and comparative civilization of different sections. Then must come a consideration of the educational campaign. Other states have suffered because of lack of a great state program. Texas is in a position to lead the way by a strong state commission.

Because we have expressed the opinion, voicing the belief of trained observers in the four larger cities at least, that tuberculosis is a menace, it must not be presumed that present conditions are much worse than in other states. The

THE MODEL CORRAL OF SAN ANTONIO.

Renting for $5.50 a month, these little houses are occupied by steady, hard-working men.

only difference is that Texas is adding rapidly to its burden by reason of alien accretions. With this added burden, only a few health officers have acted with any degree of vim. A few have attempted to hide conditions. Others have affirmed that there were no "native" cases, which is nothing less than wilful blindness. But whether there has been activity or laxness, it matters not. Because of climatic and present social conditions, the tuberculosis problem is primarily a state problem in Texas.

In the field of the juvenile court and probation there is the same apparent need of a state juvenile court commission. The history of this movement in Texas plainly indicates that it is now in need of the patient, careful, intensive field work which must always follow the active propagandist stage. As the result of enthusiasm, there was imbedded in the Texas statutes a law covering juvenile court and probation which was practically copied bodily from the statute books of another state. In some ways lawyers have affirmed it was a misfit. Its legality on some points is so seriously questioned that the judge in one important city juggles his dockets so that technically juvenile court cases are tried on a criminal docket. As a result, we were told of one case where a weak-kneed jury refused to take a child from a notoriously immoral woman, on evidence which any juvenile court judge would have accepted as convincing.

In another large city the probation system has been badly discredited because the judge has been trying to work out a "big brother" volunteer scheme with no paid official as a center. In short, some of the best friends of the movement acknowledge that, excepting

THE CONTINUOUS CORRAL.

Under new ownership it has been brought up to a high standard of cleanliness.

in a very few places, it has broken down completely. There is need to see where the law should be remedied, what system would best fit counties varying in wealth and in social conditions, when the paid officer should be paid from the public moneys, and so on through the whole long chapter. Texas was not ready for the plan; it had not been worked out in sufficient detail. What is being done now should have been done in the first place. The day was saved in a few places, like Dallas and Houston.

THEIR ONLY OUTLOOK.

A city beautiful movement has been started in San Antonio—but not in this alley.

For instance, in Dallas the Women's Club paid for a good officer until the county was willing to pay for him, following the old Chicago plan. But there cannot be the slightest doubt that probation needs rejuvenation on a carefully thought out and intensive plan.

Though in tuberculosis the state has been slow in awakening, this is not indicative of its attitude in other fields. The child labor problem now receiving attention in the state is practically one of prevention. There are unmistakable evidences of increasing manufacturing interests. At the same time there is nothing resembling the cotton mill conditions in some of the other southern states. Whatever of administrative coercion is now exerted in this broad state must be by one lone commissioner of labor statistics and a deputy at Austin, who notifies the district attorney in case violations come to his attention. The district attorney notified must prosecute. In several pretty bad situations the commissioner or deputy has gone to the scene and righted matters. But everyone recognizes that they can give only incidental protection.

The present child labor law prohibits employment of any child under twelve in factory, manufacturing mill, or any establishment using machinery. Children between twelve and fourteen the statute bars out, and those who cannot read nor write, unless the child has a widowed mother or incapacitated parent to support. Employment under sixteen is prohibited in breweries, distilleries, and in marine service. The twelve- to fourteen-year-old children who are employed, can drive away idleness only between the

hours of 6 A. M. and 6 P. M.. They cannot work all night. Proof of age is most rudimentary. Furthermore, there is no compulsory education law.

With this situation, leaders in social work in Texas are considering two things: first, the organization of a state child labor committee; and, second, the placing of all emphasis just now upon legislation which shall fix an absolute standard age limit of fourteen, and shall further, as the opportunity offers, a state compulsory education law. No wiser decision could be made. It is not a situation which indicates improving the administrative machinery, in order completely to accomplish what the present law intended. Rather every detail of the situation seems to cry out for the strategic advantage of getting a better and absolute standard on the statute books, and then fighting for the administrative details later on; especially so as industrial interests grow apace, and problems become more complicated.

With reference to a legislative program of this sort, it is interesting to the writer to remember some comments made to him upon the uncouthness of the Texas Legislature. It was not his fortune to see it at work. But certainly it cannot be accused of unwillingness to accept "new fangled" ideas, an accusation which could rest against certain other Legislatures.

Let us take these two movements, for instance, child labor and juvenile probation. Its legislation on these two subjects is really remarkable, when one remembers how strong in Texas is the tradition that a man's home is his castle, and his children his own. Even in some of the cities it is so. The writer was called sharply to account in Fort Worth for having ventured to remark that in the ultimate analysis the state must be responsible for its children. The "castle" idea is still a more or less popular tradition, redolent though it is of Middle Age isolation and oppression.

While the three campaigns above mentioned must begin from the state end, there is another which must be taken up in the individual cities. From El Paso, with its miserably damp and dark Mexican adobes fringing the international boundary along the historic Rio Grande, to the opium shacks in the bottoms of Dallas, there is in every one of the five cities a need for some rudimentary housing regulation. There is an amusing yet sardonic tale of the time when the presidents of the United States and Mexico were to meet at the Rio Grande. It was discovered that a most irreverent, unreasonable and utterly miserable group of so-called houses bordered the line of progress, and refused to hide itself. What easier than to hide it with a huge fence! That is the logic which El Paso used. Visiting physicians affirm that only the climate has saved it from desolating scourges. But even the climate cannot avert all disease, and the worst of the adobes have been responsible for the spread of indigenous tuberculosis. Nevertheless, adobes built lately have been better, and work for mothers and babies carried on by the Woman's Charity Association last summer gives promise that El Paso will slowly awaken to the need of cleaning house. More definite word has come to us in a recent dispatch from El Paso, that the city physician, W. H. Anderson, has recommended the destruction of 1,500 shacks for the protection of the health of the city. The City Council ordered him to begin to destroy the worst ones, and to force sewer connections in those that are habitable.

This habit of setting apart ugly facts by themselves is not confined to El Paso. In San Antonio, for instance, the news-

MANUFACTURE IS ON THE INCREASE IN FT. WORTH.

Back yards of Swift and Armour packing plants.

papers viewed with suspicion and alarm a little description of a visit paid to some picturesque horse corrals which thrifty property owners had transformed into "model dwelling houses." Imagine a hollow oblong, pointed on three sides, with a continuous row of corrals, more or less partitioned off, and housing, apparently, fifty families or more. Incredible as it may seem, there was even danger from fire because of the possibility of the one single and narrow place of egress being blocked with people and household belongings. Certainly the sanitary arrangements had the virtue of being plain and above board. Nothing was concealed—a few common privies, a common pump or two, everything deliciously Arcadian and odorous. The cheerful Mexican families, one newspaper assured us, positively joyed in these simple houses. There was, too, a link which tied these peaceful retreats to busy downtown, for here the pecan nut workers were getting their wares ready. In a city in which the use of the word "tuberculosis" by the Associated Charities secretary in her newspaper articles was resented, it is not to be wondered that it was considered quite bad form to speak of corrals. When they were mentioned, nothing would do but to send a reporter to about the best one of the lot, to bring his impressions back, enriched by the rosy hues of an active imagination.

But despite its land boom and tourist boom and hotel boom and all, San Antonio is beginning to awaken to the need of cleaning up its back yards. Curiously enough a city beautiful movement has been started in San Antonio, but its leaders evidently were not taking housing into their program. Their talk was of beautifying the two banks of the canal which runs through the city, and such like. Imagine a beautiful canal and man corrals in the background! It has remained for the owner of one piece of corral property to improve it, and since then there are the evidences of the beginning of a social conscience. A campaign will be waged this coming season.

It is only because of the somewhat picturesque side of the housing problems of these two cities that they have been so specifically mentioned. There are sores in the other cities as well. The housing problem is already part of the program of the newly organized Central Council of Social Agencies in Dallas, and there

should be a corresponding movement in all of the cities of the state. All in all the conditions are pretty bad.

DOORYARD OF A MEXICAN HOME, EL PASO.

So this leviathan commonwealth is beginning to find itself. In age not so young, in youthfulness very, very young, but big, it is like some boy giant of sixteen, all bulging and bursting out of his outgrown clothes, awkward and ungainly. Whilst harking back to the pioneer days, cities have been growing and growing, railroads have been invading, the hordes of well and ill have been encroaching, the social problems have come, most insistent of all—not only those spoken of, but others.

What will be the outcome? If the writer mistakes not, there will be some mighty interesting tussles down there in the Lone Star State—sharp and pointed and fruitful encounters! It would be invidious to mention the strong men and women to be found in the Associated Charities of the different cities, the Mothers' Congress, the Women's Federation, the Conference of Education, the Labor Council, and the settlements, or to single out those men in the university who are helping in the socializing of the schools, and in gathering and furnishing data for penal reform, for state civil service, for every progressive movement. There is something of the pioneer strength and doggedness about those who have already enlisted; they are always eminently practical save in one point—state legislation.

A most interesting illustration of this is given by the Women's Club in Dallas. It could count upon a small amount of money to use each year in encouraging new social work. Therefore it induced the city authorities to create the office of matron in the jail if the club would pay her salary for six months or a year. It had a hand in the selection of the matron, and of course when the agreed upon time expired, no one would hear of abolishing the position. The matron had made herself too useful and she was put on the city pay roll. In the same way the club for a time paid for a probation officer. Now the county pays him, and he is a good officer. Next came a

PLAYGROUND AND BATH HOUSE AT DALLAS.

The Women's Club secured the playground, a paid probation office and a jail matron.

playground director, and, if not already a city employe, he soon will be. Thus in about three years, by attending strictly to one thing at a time, the club has three most helpful social agencies at work.

Not always, but sometimes, as we have indicated, there has been lack of wisdom in state legislation. We believe this is due as much as anything else to the isolation forced by the unending miles which seem to separate city and city. There has not been sufficient exchange of views, sufficient understanding, sufficient criticism, between different groups, different cities.

It is for this reason that the formation of a state conference of charities and correction has been urged. It is plainly and apparently one of the chief needs of the state. The unending miles must be overcome.

In both city and state there seems to be one other handicap to overcome. Many of the business men of the state have seen their business grow, without relieving themselves of the details which could be entrusted to able subordinates. They have become slaves to detail, and have not allowed themselves the margin necsary for interests outside the walls of their own offices. A few have come to realize how inevitably this leads to a slowing down in their purely routine work, as well as in the evolution of those larger plans which only a stimulated business imagination can produce. These men have become intensely interested in one or another phase of social development, and have realized the moralities involved. Ethics, something more than personal ethics, is undoubtedly receiving more and more attention, and the fruition will come when more men refuse longer to be mere machines of addition and subtraction.

It is true that some complain of inadequate support of voluntary work. But adequate support is dependent upon the vitality of the interest in any particular work. It is true that the habit of subscribing liberally may not be present; but it can only come when men actually make sacrifices, and they do that when a social activity has become as much a reality to them as their own business.

That outlook upon a little of the center of Texas and at one of its edges, with its teeming acres, its horizon-confined pastures, its desert splendor, its wide-flowing rivers, its magnificent vastnesses, its fascinating cities, its vigorous peoples, convinces the observer of one thing: it is to no mean destiny that this princely state is tending. And in that destiny social progress, if one may judge by what has been forthcoming even in these earlier days of isolation and lack of cohesion, will play no mean part.

Not Mexico, but preventable disease and the curing of social and individual ills—this is the fight in which the Lone Star State will engage with all that matchless vigor and audacity with which it waged warfare in those never-to-be-forgotten days of the fifties.

November 19, 1910.

THE HOUSING AWAKENING

I.

LAWRENCE VEILLER

SECRETARY NATIONAL HOUSING ASSOCIATION

America has at last awakened to the consciousness of her slums. Throughout the land a new sense of social and civic responsibility is stirring. The "new view" of charity has brought with it a new sense of values. Social workers are now seriously asking themselves what shall it profit a man to go to the hospital if he must soon return to some vile slum.

It is now the rare person who does not immediately assent to the view that prevention is better than cure, and there is a growing conviction in all our cities that poverty is curable and even preventable. That bad environment is responsible for many of the ills of the body social and the body politic, is denied by few.

Ignorance, folly, vice, sin, and other forms of human weakness will not altogether disappear from our horizon, but we are beginning to see, as never before, the blighting effects of adverse circumstance upon both the weak and the strong. We refuse longer to believe in the innate depravity of the human race and seek outside of the individual for the causes of human frailty.

We are rightly charging to our travesties of homes, the responsibility for much of poverty, crime, insanity, disease, industrial inefficiency, political degradation. The shame of the cities is upon us, and we are feeling, as never before, the moral responsibility for the continued existence of our slums.

These sentiments, moreover, are confined to no one section of the country—from ocean to ocean, the country is aroused. North, South, East and West share in this awakened conscience.

Nor are these views by any means limited to social workers. Editors, magazine writers, public officials, conservative business men, nurses, physicians—all are awake to their responsibilities.

Mirabile dictu, these beliefs are being translated into action. Here and there a social worker, overborne with the sense of the futility of the old methods of relief work, is pointing out to his associates and directors that it is more important to have adequate sanitary inspection in the homes of the poor than it is to provide coal and clothing—that instructive visiting nursing may be better than grocery tickets, that the city itself had better spend its money to strengthen its health department, than to supply outdoor relief.

It is not strange that we should have awakened to the dangers of our slums, for they have forced themselves on our attention with an insistence that could not be disregarded. Their coming has in most cases been associated with the advent of new races of immigrants, and, like most imported articles, they are costing us dear. No tariff wall has been high enough to keep them out. Few cities have been immune from the slum invasion. Staid New England college towns like New Haven have awakened with a start to find that one-third of their population is of recent foreign importation, that they have not only slums but a serious housing problem. Aristocratic Baltimore has discovered that she has heretofore been "barbarous Baltimore", and now rises in her wrath determined to slay the hydra-headed monster that has been sapping her vitality.

Indiana, stirred to its depths by one woman's recital of the wrongs of the poor, has determined to do away with her slums, and taken the first step towards that important end.

Milwaukee, a younger city of the Middle West, stimulated by its new socialist leaders, is going not only to stamp out its slums, but purposes to build for its workingmen new homes on the city's outskirts.

On the Pacific coast, the stirrings of the new ferment have been profoundly felt. Los Angeles, the city of most things good, is wiping out its small slum nucleus, and through its capable woman sanitary expert is affording the whole country an object lesson in the possibili-

ties of reform through "teaching the tenant." San Francisco, risen from its ashes, is unfortunately rearing for itself future plague-spots—but here, too, public-spirited men and women are alert and on guard.

Ohio is aroused and militant. Cleveland, city of civic spirit, and Cincinnati of civic shame, are joining hands with Columbus in sounding the death-knell of the slum.

Philadelphia, rightly famed as the "city of homes", is anew affording the country an object lesson, showing how two million people are being housed in individual small houses.

Buffalo, which for years has been the admiration of housing reformers, with its miles and miles of small houses, now shows that what has seemed so fair, may be most foul; and how the problem of room overcrowding is inseparably bound up with problems of race, in her "city of huddled Poles."

Chicago, with her miles of alleys and her magnificent distances, offers an example to the whole country in her wise standards of height limitation for new buildings; Detroit, with its sudden extraordinary growth and marvellous industrial development, has not escaped the common lot of other cities and is now fighting her incipient slums, determined to nip the evil in the bud. St. Louis, partly aroused, is at work, seeking relief from many intolerable conditions.

In the South, Kentucky has led the way and has passed the best housing law in the country, due to the public-spirited work of a few men and women in Louisville.

Washington, the nation's capital, whose blind alleys have for years been the nation's shame, is soon to show the country how a city may deal with its plague-spots and make them into gardens of delight.

Hartford, unduly burdened for a city of her size, has at last determined to throw off the reproach of her bad housing conditions, and has evolved a plan for building model houses for her workingmen in the outskirts of the city, combining this with a plan of industrial development.

New York, distinguished for having the worst housing conditions in the world, but long the leader in housing reform in America, continues that leadership. Her 7,000 privies are now a thing of the past, and her 100,000 windowless bedrooms are fast disappearing.

Even Boston, where housing reform has been "in cold storage" for the past twenty years, seems at last to have been stung out of its self-satisfaction and complacency, and, though prophecy is dangerous, it may translate thought into action.

The Russell Sage Foundation through its interesting and valuable researches is about to demonstrate in outward and visible form the possibilities of cheap concrete construction through the "poured house."

Finally, the National Housing Association has come, to focus attention on the problem, to tie together the scattered threads of effort throughout the country, to stimulate and encourage, to place its experience at the service of those who need and desire it.

What strikes the observer about all these cities is the similarity of the problems. Disease-breeding privies, neglected alleys, filthy out-premises, lack of water supply, room overcrowding, defective drainage, windowless rooms, insufficient ventilation, dilapidation, neglectful landlords, and inadequate attention by the health authorities seem to be the common lot.

The outlook for the future is hopeful. The old idea that the housing problem could be solved by building a "model tenement" is fast disappearing. In its place, one finds emphasis laid upon housing laws which will control the situation for all time; on efficient and vigilant sanitary inspection; on Garden Cities and model small houses in place of huge tenements; on instructive visitation of our immigrant population, and the teaching of the elements of hygiene in the public schools and in the home. The country, though awake and aroused, does not yet sufficiently realize its obligations—does not yet quite appreciate that eternal vigilance is the price of liberty and that when it enlists in the cause of housing reform it must enlist for life.

FRANCES PIMM STRICKLAND

HARRIS ELY ADRIANCE
CHAIRMAN YORKVILLE DISTRICT COMMITTEE, NEW YORK CHARITY ORGANIZATION SOCIETY

Death has again deprived the Charity Organization Society of one of its oldest and most efficient workers, and in the sudden passing away of Mrs. Strickland, the Yorkville District finds itself bereaved of its faithful secretary. On Sunday afternoon, November 6, as she was about to enter a friend's home, Mrs. Strickland was smitten with apoplexy and fell unconscious at the threshold. She was taken to the Presbyterian Hospital and lay in a state of coma until Tuesday afternoon, when she fell asleep.

It was in 1890 that Mrs. Strickland first connected herself with the Charity Organization Society, as a clerk in the Registration Bureau and a general visitor. As she familiarized herself with the duties that fell to her lot to discharge, she gained in resourcefulness and vision, until in 1897 she was appointed superintendent of the Joint Application Bureau, which office she capably filled for seven years, passing in 1904 to the oversight of the Yorkville District. Here she labored until she was smitten, as it were, on the "firing line," and fell in the fullness of her powers.

It is as a social worker that the writer knew Mrs. Strickland, and in passing her life in review it is simply fitting to chronicle those features of it, that within such lines made the deepest impression.

Mrs. Strickland was a devoted woman. Some tasks, as we all know, become in process of time almost mechanical in their performance. They are done, to be sure, but done because they have to be done, and the grinding of the machinery is ever in evidence. When human lives are the materials with which one is working, the mechanical mode of effort is deplorable. How far removed Mrs. Strickland was from this chilly mode! Despite the fact that her duties were most exacting and ever drew upon vital forces not over strong, she never lowered her standard, but kept nobly at the level of love and sympathy. On the records of the society there stand cases that testify to her devotion. She bore with the stubborn, she patiently strove with the ignorant, she instructed the simple-minded and won back to health and service the plague-smitten life. In the heat of summer and through the stormy days of winter she clung to her duties, though ofttimes at the risk of her own well-begin.

Mrs. Strickland was discerning. Discernment is a prize requisite in charitable work, and she possessed it to a marked degree. The ability to discriminate as between the false and the true, to sift statements, to strike a just balance, and to minister relief accordingly, is the fruit of earnest and untiring effort. Again and again in the final discussion of difficult cases the committee sought the opinion of its district secretary, and her ideas prevailed in its ultimate conclusion.

In fact, it simply remains to be said that Mrs. Strickland was a wise woman. Her words to a new worker bear witness to this. The keynote of her service lay in the advice she modestly gave to the friend, "Always when you are inclined by your head, listen to your heart." Could there be a clearer or safer motto for one who must face and unravel the tangled tales of distress and want? To know that head could not do all and that heart must guide as well, is to mingle kindness with sane judgment, and so this good woman did.

And now her work is done.

> Others shall sing the song,
> Others shall right the wrong,
> Finish what I begin,
> And all I fail to win.
> What matter, I or they,
> Mine or another's day,
> So the right word be said,
> And life the sweeter made.

"Faithful unto death" is the simple tribute worthy of inscription above her resting place.

EYE-STRAIN AND THE TEN-CENT STORE

LILLA A. GREENE

Last winter I visited fifteen five- and ten-cent stores in Manhattan, in each of which I bought or tried to buy glasses just as any other purchaser would. My first two visits were rather unsuccessful because I had not yet learned how to ask questions and consequently left without much information. In the first store the clerk sent me to the manager, who naturally declined to state how many pairs of glasses the store sold each day. Two months later, however, I returned to those two stores and had all of my questions answered.

The fifteen stores are not entirely under the one management best known, but include others as well. They are situated in all parts of the city, the lower East Side, Fourteenth street, Third, Sixth and Eighth avenues, 125th street, Columbus and Amsterdam avenues. It is not only the poor who buy cheap glasses at the ten-cent stores.

Sometimes I went into the store without my own glasses—much to my own discomfort, because I was barely able to find the counter—while at other times I wore them and asked for magnifying lenses or some glasses that would ease my headaches. Various were the attempts to fit me, either with or without a test card. The card which is used for testing is quite different from even the ordinary card used by an oculist. It contains lines of type, the largest at the top and gradually diminishing in size towards the bottom. Opposite each line is a number, which does not correspond to any scientific prescription for lenses but merely represents the numbers pasted on the glasses. The "patient" reads down the type, holding the card fourteen inches from the eyes, until he reaches the finest type that he can read without glasses; then the spectacles corresponding to the number opposite the line, are the pair which he needs. This is crude testing in comparison with the method of the best oculists, which involves several visits, "drops" in the eyes to dilate the pupils, and sometimes hours of "fitting" until the right lenses are obtained. Out of 150 pairs of glasses I tried on, there was not one which I could even see through. I cannot see across the street without my own glasses; with these I could not see the clerk. Although my sight without glasses is not very satisfactory for reading, with these I could not read nearly so well. I shall have to forbear testing for myself the statements of those who say that they find them a great help in preserving the sight.

In thirteen of the stores I bought the glasses which, according either to the test-card or the clerk, my eyes required, and afterwards these glasses were examined by a competent oculist and their measurements noted. The results were as follows:

Store	Stock number of glasses bought	Description of these lenses in terms of an oculist's prescription
1	5	+6.75
2	10	+1.25
3	18	+2.25
4	24	+1.62
5	24	+1.62
6	32	+1.25
7	34	+1.0
8	38	Right +.87 cyl. +.25 ax 155 Left +1.25
9	44	+.87
10	48	+.75
11	50	+.87
12	60	Right +.62 Left +.37
13	70	+.50

Note how the numbers vary in the glasses with which I was fitted. The lowest numbers are supposed to be the strongest lenses, the lenses gradually becoming weaker as the numbers grow higher. The measurements do not confirm this theory, except in a general way. No. 5 was the strongest lens. We should expect +2.25 to come next, but it is third; while the lens which comes third in actual strength (+1.62) is numbered 24. No. 10 and No. 32 both measured +1.25; No. 44 and No. 50, both +.87. The complicated measurement of No. 38 is due to the fact that the pieces of glass were so poorly ground that they represented one thing in one spot and something quite different in another. It is noteworthy that in two of the stores, 4 and 5, the same "prescription" was

given me, glasses No. 24, and these two pairs of No. 24 turned out to have the same lenses.

Compare now, with the glasses in the table above, the prescription for the lenses which really fit my eyes:

	Spherical	Cyl	Axis
Right eye.....	—2.37	—0.75	30°
Left eye.....	—2.37	—0.25	40°

With + .75 added to each for near work.

All the glasses that I tried on were for far-sighted eyes; mine are for near-sighted. They are mostly plain spheres, while mine are rather complicated. Both lenses are the same for both eyes, while mine are quite different. Perhaps I am not a fit subject to buy ten-cent store glasses, because of a complication of defects, "unsymmetrical myopic astigmatism with sub-normal accommodation." Probably, however, many near-sighted people like myself try to fit themselves with these far-sighted lenses. As a matter of fact, these particular lenses would not be apt to fit anyone correctly and are just so many waste pieces of glass.

It is surprising to learn how many such glasses are sold. The statements of the clerks cannot be relied on absolutely, but nearly all emphatically stated that they sold "lots of them." A crowded store in one of the best business sections averaged six dozen a day. In a lower East Side store, when I told the clerk that some stores sold as many as five dozen a day, she answered: "We seldom sell more than two dozen. They might sell more in some places but not in this district." The least number given was from half a dozen to a dozen pairs a day, in a small store situated on a street where few people pass by. One clerk said that "people come in almost every minute"; another that "most everybody that passes the counter buys a pair, if only to rest the eyes." If the estimates can be depended on, in the thirteen stores about thirty-five dozen glasses are sold each day—thirty-five dozen glasses which cannot but cause a vast amount of injury, because neither the clerk nor the purchaser has any idea as to whether the lenses are the ones needed. It is safe to say that nine out of every ten are wrong, causing strain, although perhaps each individual thinks that he can "see better."

Fortunately children and young people do not buy them much. At one place the girl said that children came for them only when they wanted "grandfather glasses" for parties. I know one girl who as a child bought greenish-blue glasses at a candy store for a penny and wore them "just for fun" when her mother did not know it. She wore them so often that serious injury resulted, and this is probably due to the fact that the glasses were cheap and where she could easily get them. Almost everywhere I was told that most of the customers were "elderly" people. I do not agree with the *Ladies' Home Journal*[1] that "men know better than to buy these cheap glasses," because I have seen more men than women buying them. In the first store that I visited a man came to the counter and began looking over the glasses. He said that he had worn three or four pairs from the ten-cent stores and liked them. When I remarked that they were harmful, he admitted it and left the store, probably to go into another one nearby, as there are three in the same block. One of the men whom I saw buying glasses tilted his head nearly to his shoulder in order to read. When I asked a clerk who was wearing glasses whether they were the kind that she was selling, she said, quite indignantly, "O no, I got mine from a doctor!" Another clerk said that people told her that the glasses which she sold were "better than the ones they pay eight or nine dollars for." This particular girl was wearing a seven dollar pair which she did not consider much better than the ones she was selling, "except of course mine are gold." While I was in this same store a woman came in to buy a pair because she had left her "near ones" at home. She often bought them, for they were just as good as the ones for which she had paid eight dollars. She often puts them on in the evening, but supposes if she wore them much they might perhaps hurt her eyes. "The truth is," she liked her ten-cent glasses so well that she sent in a friend, who had expensive glasses but now wears the others. This woman was remark-

[1] October, 1909.

ably well-dressed and of good appearance, but her face showed the effects of eye-strain. Still another clerk remarked that "lots of people like them better than four or five dollar ones. They usually have been wearing them before and know what number they want." One man with whom I talked said he had several pairs in his pocket. These he interchanged when his eyes tired of one pair.

There were two other stores at which I bought no glasses. At one the entire stock consisted of a few pairs of Nos. 5, 12, 16, and 30. They had sold all the others. The clerk did not consider that any of these were suitable so I went away without a pair. The other store was a small independent one. The proprietor himself waited on me. I told him that my eyes were bothering me and I wanted to rest them, which was the truth. He thought that I needed about No. 30 because I was young. When I could not see anything through them, nor through No. 5, nor No. 12, he asked me, "Have ye astigmatism?" I told him that I had. "Well, don't believe it. There are a lot of fakirs who just tell you that to get you to buy their glasses." He thought his glasses helped people—"they are fine for some people." Then he tried on my own glasses to see what they were like and removed them very quickly with the remark, "I guess your eyes are pretty bad; perhaps my glasses would make them worse. As much as I want to sell them to you, I advise ye, lady, not to take them."

The five- and ten-cent stores are not the only places to be criticised on this score. There are the street peddlers of Canal and Grand streets, who charge twenty or twenty-five cents, and the department stores, where it is possible to get eyes examined and a pair of spectacles for a dollar. There are many places where eyes are tested free and high prices charged for worthless lenses. In all of these places a vast amount of misery is being manufactured. Legislation is needed to restrict the sale to opticians who fill the prescriptions of oculists. There are poor oculists, of course, who are doing harm, but these girls and men "test" eyes and "prescribe" glasses without the slightest knowledge of opthalmology or optometry.

BOOKS FOR SOCIAL WORKERS

LILIAN BRANDT, Contributing Editor

WILD OATS. By James Oppenheim. B. W. Huebsch. New York, 1910 Pp. 261. Price $1.20; by mail of THE SURVEY, $1.29.

The seventh commandment, in breach or observance, is not a new theme for a novel, but never before have we had fiction written to teach the facts regarding venereal disease. The wild oats sown by a careless boy are harvested in his baby's sightless eyes and his wife's broken health—this is the gist of the little book, which is written with Mr. Oppenheim's characteristic charm and grace. The story is good and Dr. Rast's reappearance will be widely welcomed. Much of the interest comes from the author's intimate and colorful knowledge of the East Side, where the scene is laid. But the romance, the first glimpse into a new and wonderful world which comes to his lovers, holds good the world over. All through the book carries in clear, convincing terms a message which has hitherto been confined to the writings of sober, statistical folk. It grows in importance from the everyday likeness to us all of the heroine and the young man she marries. It is a good book for young boys and girls and for all who have to do with them, parents and teachers and club leaders. The past summer it was read aloud in several boys' camps, for which its wholesome frankness and its strong suggestion of clean living are particularly valuable. That it has sold into a second edition in a short time promises that the author's brave purpose is bearing fruit.

THE SCIENCE OF LIVING OR THE ART OF KEEPING WELL. By William S. Sadler, M.D. A. C. McClurg and Company. Chicago. 1910. Pp. 420. Price $1.50; by mail of THE SURVEY $1.62.

This is a very good book on medicine for popular education. Perhaps its most important portions are the chapters on digestion, nutrition, and the chemical composition of foods, which take up about one-third of the book, but all other aspects of personal hygiene also are well discussed.

Some anatomy and physiology is included, but to what purpose is not clear, since it is not essential to the practical instruction given. Too many scientific terms are introduced, and

the attempts to astonish the reader (*e. g.*, by the total number of cells in the body and other incomprehensible numbers which even the medical student never comes across) are too apparent.

The author is to be congratulated on being true to his religious colors in emphasizing that what patients need today is not "psychotherapy" but a practical demonstration of their professed Christian faith.

THE FRESH-AIR BOOK. By J. P. Müller. Frederick A. Stokes Company, New York. 1910. Pp. 152. Price $.85; by mail of THE SURVEY $.91.

This little book is a very personal presentation of the writer's opinions on fresh air. He would reduce all clothing to a minimum, and that limit for him is almost zero: no hat, no stockings, only sandals, or better still nothing, on the feet, no night clothes, and when possible "air baths," and gymnastics according to "my method." He seems to belong, however, to those non-medical hygienists who cannot recognize that there is a difference between a disease and susceptibility to that disease, and his comments on appendicitis, rheumatism, gout, and so on, are correspondingly unfortunate. If air baths combined with gymnastics so raise a person's resistance that he is not susceptible to a given disease,—splendid! But that throws little light on the nature of the disease itself.

THE MORPHIA HABIT AND ITS VOLUNTARY RENUNCIATION, By Oscar Jennings, M.D. (Paris). William Wood and Company. New York. 1910. Pp. 502. Price $2; by mail of THE SURVEY, $2.10.

This book purports to be the story of the voluntary suppression of the morphia habit after twenty-five years' addiction as recorded in the diary of the patient. By far the greater part of the book, however, is a description of the author's method of handling these unfortunate cases, and has the tone of an advertisement. Much condensed it would make an excellent article for a medical journal.

HEALTH AND SUGGESTION. THE DIETETICS OF THE MIND. By Ernest von Feuchtersleben (sometime professor of medicine in the University of Vienna). Translated and edited by Ludwig Lewisohn, M.A. B. W. Huebsch, New York. 1910. Pp. 168. Price $1; by mail of THE SURVEY, $1.06.

The American reading public may well congratulate itself that this little German classic has been translated. We are too apt to speak of the mental medicine of which we now hear so much as "new thought", when as a matter of fact it is not at all new. We have not yet appropriated all that was well known over sixty years ago, when this book was written.

This book has passed through many editions in Germany, and has been included in several of those series of very inexpensive publications so popular there, which means that it has reached a large part of the German reading public. It is a classsic but it cannot now serve as a text book of mental therapy. Written at a time when psychology was unborn, and when that part of philosophy which might serve the practical purposes of the therapeutist was little developed, the author must of necessity preface each topic by introductory paragraphs explaining the philosophical basis of the practical lessons he wishes to teach. The college graduate of today who has studied psychology, and who remembers it, will see here much that is familiar and perhaps some to which he must take exception. Again, pathology, as a serious medical subject, began its existence after this book was in print, and those trained in the subject will not agree to some of the medical premises which our author states: for instance, that melancholia is merely, or chiefly, due to faulty mental habits. But the lessons Feuchtersleben tried to teach are just as valid today as during his lifetime, and it might be added, as valid as during the lifetime of those who wrote the New Testament, where these same lessons are taught with even more emphasis.

It is our ignorance of what other nations and other generations talked about which makes us speak of the present movement as "modern." This was not the only book on mental therapy written during the first half of the nineteenth century and perhaps not the most important, but perhaps the most popular. It is very important as well as interesting that the movement towards mental therapy then was headed by physicians, rather than by clergymen and other laymen as today; that is, by men who were well trained in observing the effect of various kinds of therapeutics. This may be one reason why their writings have lived so long.

A MESSAGE TO THE WELL, AND OTHER ESSAYS AND LETTERS ON THE ART OF HEALTH. By Horatio W. Dresser. G. P. Putnam's Sons. New York and London. 1910. Pp. 204. Price $1.25; by mail of THE SURVEY, $1.35.

This book is one of a series of fifteen on this and kindred subjects by this author, and is one of the great number of books now appearing on mental medicine. The author, like most who are now writing on this general subject, is not a doctor. He is a lecturer on philosophy. From the medical point of view the two illustrations of the success of mental therapy given on pages 117 and 118 are almost ludicrously unconvincing. It is hardly possible to diagnosticate "tumour on the brain" certainly before operation or autopsy. One may suspect it strongly but is never sure until he has looked within that firm, bony, closed cavity of the skull. Eminent medical men have made the diagnosis in cases which presented all the classical symptoms, only to find that the trouble was—in one case, for instance, Bright's disease, and in another, simple eye-strain. The second case is funnier yet. This patient, who recovered

under mental treatment, was "incurably ill with tuberculosis."

While these points are relatively unimportant, they show the wisdom of allowing a physician to read such a manuscript before it goes to press. Most of the book is excellent. We have read nowhere else so good an historical sketch of the movement which it represents, and of kindred movements, while the messages to the well and to the sick, to the clergyman, to the student, and to all, cannot be read without profit.

THE TRUTH ABOUT TUBERCULOSIS AND ITS ONLY CURE. Written and published by J. V. Moore. Royal Oak, Md. Pp. 64. Price, $.25; by mail of The Survey, $.28.

This is similar in plan and purpose to the pamphlet issued a few months ago by Will M. Ross, both of them being written by patients, who have thus given valuable contributions to the literature on tuberculosis.

Mr. Moore's book conveys but one message: that the cure of tuberculosis depends entirely upon the patient, and that no amount of medicine, care, or treatment will produce a cure unless the patient himself co-operates fully. The tone is perhaps a little too positive in some places, for while all reputable physicians are in perfect accord on the essentials in the cure of tuberculosis, there are many minor details (such as "forced feeding," the use of some drugs, such as creosote, or the value of tuberculins) upon which there is still dispute. Mr. Moore's dogmatic statements on some of these points may easily discredit him with some physicians. On the whole, however, the little book is one from which any tuberculosis patient will receive great help and inspiration, and its price is a good feature.

THE CONQUEST OF CONSUMPTION. By Woods Hutchinson. Houghton Mifflin Company. Boston. 1910. Pp. 138. Price $1; by mail of THE SURVEY, $1.08.

This book is particularly adapted for gaining adherents to the tuberculosis movement. It is especially recommended, therefore, to everyone who is not already interested in the subject.

COMMUNICATIONS

TRANSPLANT THE JUVENILE COURT

TO THE EDITOR:

At the last meeting of our Social Service Club in Seattle, the topic for discussion was The Juvenile Court. Judge A. W. Frater was the principal speaker. A lively discussion followed, engaged in by teachers, nurses, probation officers, clergymen and others. At the close of the meeting I met Prof. Edward O. Sisson of the University of Washington. He had spoken of the use of the psychological clinic for juvenile offenders. I took him by the hand and said: "Do you know what ought to be done? The whole work of the juvenile court should be taken bodily out of the judiciary, have its name changed and be set down in the educational department of the municipal life." He exclaimed, "Why, I was thinking tonight of that very thing."

The thought may not be new. To us it was new. It seemed to be exactly the culmination of the trend of thought in the treatment of delinquent and defective children. All have observed that the delinquent boy, ten years ago, was treated as a criminal. Very swiftly, however, public opinion has changed. The judge is gradually assuming a parental aspect. The whole treatment is fast becoming an educational problem. Why not put it then where it can be best solved—in the educational department?

There would be many advantages. The juvenile delinquent would thus escape the taint of criminality. The public school board is generally better equipped to handle the boys and girls. The modern treatment of the "bad boy" could thus be applied to small towns all of which have rather efficient school boards. It would eliminate the discord, now existing, between the several societies that each wish "to have a finger" in the treatment of the boy or girl. The public schools are nearest the people and may safely be relied upon to exercise the paternal function. The policeman would be largely eliminated and the great work of treating the defective and delinquent would be placed just where it belongs—in the bureau of education.

SYDNEY STRONG.
Pastor Queen Anne Congregational Church, Seattle.

TO THE EDITOR:

The suggestion in Dr. Strong's communication is not new. Aside from grave legal difficulties in the way of accomplishing the proposed change, the reasons urged in favor of it do not seem conclusive.

The courts that treat the child before them as a criminal do violence both to the letter and spirit of the law. Is not the remedy here to socialize the court so as to bring it into harmony with accepted methods, rather than attempt the doubtful expedient of taking the whole matter out of the court's hands? It is quite possible—even in modern juvenile court laws—to go a step further than has been done toward eliminating from the law all evidence from adherence to the criminal law. Instead of saying, as we do now, that a "delinquent child" or a "wayward child" or the "juvenile delinquent" is one who violates any law of the state, etc., it would be better to say any child who violates any law of the state or city, or

who is within any of the things set out in the statute, shall be deemed to be a child in need of the care and protection of the state, and the judgment would follow the original definition and merely adjudge the child to be in need of the care and protection of the state. The new bill creating a juvenile court for Rochester, N. Y., is framed along the lines indicated here.

It is by no means certain that the whole subject would be better handled by the department of education than by the court, even were it possible to place it there. The policeman is eliminated, serious efforts are made to reach the real cause back of the child's appearance in court, the court itself is brought into close working relationship with the school, church, and with every social and preventive agency in the community in all courts where the chancery idea prevails and an effort is made to carry out the spirit of the law.

Advocates of the suggestion made by Dr. Strong overlook an insurmountable difficulty in the effort to take away from the courts the question of determining the liberty of the child in cases where it is necessary to disturb the child's custody. Nowhere in our jurisprudence do we find so much power and a power of such delicate nature as that lodged in the judge of the juvenile court, and a real danger lies, it seems to me, in minimizing the importance of the legal phases of the court's work. Instead of taking the jurisdiction away from the court, it would seem better to attempt to draw to the court lawyers with real legal training and social ideals.

BERNARD FLEXNER.

Louisville.

ASSERTION—STERILE AND CREATIVE

TO THE EDITOR:

If you call a cow's tail a leg how many legs has a cow? That seems to be the fundamental question in many social problems at the present time.

I have just read, for instance, that the feeding of school children in England at public expense was adopted partly because "it was generally agreed to be undesirable that the meals should be regarded as charitable relief." The English Board of Education says that the act permitting public feeding "is primarily of an educational character." The dining halls in London "are so arranged that the entire effect shall be educative." This is done by having them "painted and furnished in light colors," providing white table cloths and flowers and plants. One would think some nutritive effect would still creep in unless the meals consist wholly in contemplation of these correct and desirable surroundings. In Italy, it is said, the work of free feeding "is regarded as distinctly educational and not as a charity." While we are in the *regarding* business why not regard it as religious? Why not regard it as a solution of all moral and economic problems, as comprising the whole duty of man? Or why not select anything else we do—joy-riding for example—and regard it in the same way? Perhaps it is in some such direction that the solution of all our difficulties is to be found.

For my part, however, I have a sneaking suspicion that the cold fact will get us in the end. I think in the long last of it money paid, or money's worth furnished, to a child or man, not because it has been earned, but because of physical need, will appear, not as what we may choose to call it—whether "educative", "reward of merit, or of motherhood" or "living wage"—but as what it is, simply public charitable relief; and I think that what it is, rather than what we call it, will determine its effect.

Not but that I believe there is a place for asserting things, and a way of asserting them, that makes them true. "Creative assertion" is indeed a hobby of mine. You can, for example, so assert a man's true self that he shall be convinced of it—if you are enough of a man yourself—and souls are saved in that way every day. But the thing must be within the power of action to effect, in order to be so created. You cannot by assertion alter a matter of cold fact nor make a relation something other than it is.

My answer is—the cow has four legs, and only four (at most), whatever you may choose to call her tail.

JOSEPH LEE.

Boston.

P. S.—Your editorial glorifying the minority report of the English Poor Law Commission, which has come since the above was written, is a case in point. You speak of "the minority, true to their principle of avoiding a duplication of agencies brought to bear on any individual," putting the children entirely under the education authorities, the aged under the pension office and the sick under the health department. If a sick person is thus prevented from growing old or an old person from getting sick, and if a child has no parents or the treatment of his parents has no bearing on the child, then this plan must work to admiration. Otherwise it would seem indeed to avoid duplication but only by making triplication the rule.

Your editorial says that the minority would "search out destitution and prevent it in its incipient stages," largely by pensions to the unemployed and others, and by whatever other care was necessary.

The pensions, etc., are to come from sources "not associated with the reproach of pauperism" and so "the social disease which produces a pauper class can ultimately be eliminated."

Incidentally this searching out of an existing disease and then preventing instead of merely curing it indicates in a striking form, the new omnipotence of labels. It beats Joshua at his own game by making the sun go backwards. Hitherto the past has been secure even against omnipotence itself.

But the method of the prevention used is equally striking and important. You are going to prevent pauperism—which as a fact, apart from calling names, is the condition of receiving public money because of poverty—by searching out incipient cases of poverty and handing out public money to them. Or, if we look below the outer fact, at the moral condition that pauperism characteristically presents, you will cure the disposition to give up in the battle for economic independence by multiplying the temptations to such surrender. Will these words "prevent", "cure", etc., win in the end or will the actual conditions govern in spite of labels?

ENGLISH FOR IMMIGRANTS

To the Editor:

Permit me to point out certain facts in response to your article, Classes in English for Immigrants.

The Immigration Commission estimates that "$275,000,000 was sent abroad from the United States in 1907" not taking into account "the large sums carried abroad by returning immigrants." Statistics published by the Bureau of Immigration show that almost forty per cent of all arrivals return from here.

Immigrants who have saved funds re-migrate; the thriftless do not re-migrate, they remain here. This process of removing the fittest is accomplished artificially. The Immigration Commission reports: ". . . there are in this country at least 2,625 concerns doing an immigrant banking business" exclusive of the multitude of those who "in a quiet way" export the savings of our immigrants. "Of the estimated number New York state leads by far with one thousand banks . . . in New York city there are known to be as many as five hundred." "In only two of the states have any laws that curbed these hybrid institutions been of any effect." While our laws provide regulation and supervision for legally constituted banks, the "banks" which solicit and receive the cash savings of immigrants are unmolested in the United States excepting Massachusetts and New Jersey. Congress and the Legislature should enact corrective measures to improve this condition.

Our farming is decadent because the natives forsake the farms for life in the cities, and because the peasant immigrants who are hungry for land are denied information of our agricultural opportunities of which they might avail themselves. If peasant immigrants were informed of the enormous difference between the price of tillable land here and in the old countries, if they could find out that no thirty-three per cent of farm products has to be paid away in taxes in this country, that no years of compulsory military service in time of peace are inflicted upon them in this country, if they knew of the benefits of American markets for farm products, facilities, institutions and the thousands of details which they do not find out in the coal mines, labor camps, and at construction or factory work—information of which is almost systematically kept away from them—they surely would stop exporting their savings, they would purchase farms here and settle down for good.

Our government should disseminate information among peasant immigrants, in the languages which they understand, of our agricultural opportunities, of our banking, of our educational facilities, of our methods and institutions, of the ways and means of becoming Americanized. To conduct such an educational campaign would involve an expenditure comparatively small in amount, and would result in keeping here large parts of the three hundred million dollars which are exported each year by immigrants, and the best of our immigrants would thus find it possible to stay here and augment American prosperity.

Chapter 514, laws of New York, 1910, and section 40 of the federal immigration act of 1907, make it practicable, if not compulsory, to perform this work.

Lajos Steiner.

Bronx.

IN THE NIGHT COURT

To the Editor:

I should like to describe a scene that I saw in the Night Court for Women the evening of October 27. A girl was brought in who, having been medically examined the night before, had been awaiting sentence. Standing in front of the judge, at some little distance from him and conspicuously elevated in full view of the whole court room, one-half of which was filled solidly with men spectators, this unfortunate had to hear the following sentence, pronounced in a sonorous and penetrating voice fully audible in the furthest part of the audience room:

"_____ _____ (the girl's true name being pronounced) the report is that you have an infectious and communicable disease called gonorrhoea, and I hereby sentence you to the hospital for a minimum of two months and a maximum of three."

In full sight of everyone the girl turned away to fulfill her sentence.

I ask the supporters of the Page clause, is this humane? is it decent? is it civilized? And one more question: Suppose that women had the power and had so used it as to compel men to submit to such a procedure—what would men think of it?

Lavinia L. Dock, R.N.

New York.

To the Editor:

Will you kindly allow the Woman's Municipal League to make through your columns a short statement in regard to its attitude on clause 79 of the inferior courts bill?

Because the league has not joined in protests by other women's organizations, it has

been stated that the league was in favor of the clause in question. As a matter of fact, the chairman of the legislative committee has attended protest meetings during the summer and has kept her committee fully advised. We feel, however, that the clause has not yet had a fair trial and we also feel that we do not as yet know enough of the subject to go on record concerning it. On October 27, a large conference of representative women met at the league to discuss the best method of observing the workings of clause 79. When our president, Mrs. Hewitt, asked the women assembled how many had read clause 79, only six hands were raised, and yet many of these women had been present at meetings where resolutions condemning clause 79 had been passed.

A committee is now being organized with the object of keeping a competent investigator in the Night Court, working for a house of detention, and to do work among the inmates when the promised house of detention becomes a realized fact.

We wish it distinctly understood that the league approaches this subject in a perfectly open-minded way. Shall it develop as a result of our investigation that we need to work for repeal or amendment of clause 79, we shall then be in a position to do so intelligently and effectively.

Such a radical departure in our criminal procedure could not but arouse active opposition, and we feel that THE SURVEY, by publishing so many letters on both sides, has done much to educate thoughtful persons in regard to it.

ALIDA B. HAZARD
(MRS. BARCLAY HAZARD.)

New York.

NEW JERSEY'S TRUNK SEWER

TO THE EDITOR:

I am surprised that you published Miss Leupp's article on the sewerage question in New York harbor without examining the other side of the case.

The twenty-five municipalities that will use the Passaic River Valley trunk sewer, now discharge raw sewage directly into the Passaic river, all of which is delivered by the ebb tide in New York bay, through the Kills, right at Robins Reef lighthouse. The proposal is to intercept all of this matter, confine it in a trunk sewer, and after careful and expensive treatment by sedimentation and filtration, to discharge it, as a colorless, harmless effluent, at exactly the same spot.

The United States government has declared the proposed plan to be satisfactory after a long and thorough investigation. The trunk sewer will discharge in New Jersey waters, and affect New Jersey shores as much as those of New York.

The South Brooklyn sewer, discharging at the opposite side of the bay, will serve a large population, and yet the city of New York does not propose to make the slightest attempt at filtration or purification. The same applies to the proposed Bronx sewer with its outlet in the Hudson. Newtown creek and Gowanus creek discharge almost a saturated solution of sewage into New York bay.

In a word, New Jersey proposes to take the first step, and a long and expensive one, toward relieving New York harbor and its own river and shore frontage. New York proposes to do nothing, but to prevent New Jersey from taking this step. If the matter comes to the United States Supreme Court, the first answer of the court will be that New York must come with "clean hands" if she desires relief from the government.

Two propositions confront New York: 1. An intercepting sewer, without screening or sedimentation basins, discharging into the ocean at a cost of over $50,000,000; 2. A screening and sedimentation system costing over $100,000,000 besides maintenance.

All talk of "disposal" of sewage, under our present circumstances, is futile. It is not possible to point to a successful example of it anywhere, and with no unoccupied area of waste land to be found in this neighborhood, it is not to be thought of.

The Metropolitan Sewerage Commission must find a better plan before it condemns ours.

JOSEPH D. HOLMES.

Orange, N. J.

[The arguments advanced by Mr. Holmes are so current in New Jersey that we welcome this discussion of them. The Metropolitan Sewerage Commission of New York has given them long and scientific study.

It does not find justification for the claim that all sewage which would be discharged by the proposed Passaic Valley Sewer at Robbins Reef now reaches the same point via the Kills. The following are, in brief, its answers to the points raised by Mr. Holmes. The sewage discharged into the Passaic river now undergoes change and dispersion—in fact sedimentation, oxidation and septic action in the long passage down the river through Newark bay and the Kill Von Kull or Arthur Kill. Under the proposed plan all of this would be discharged at one place from a trunk sewer and the proposed treatment consists of sedimentation and screening, but not filtration. The sedimentation proposed is for a short period and the ineffectiveness of the screening process may be judged from the fact that the screen openings would be four-tenths of an inch in the clear. Far from converting the sewage into a colorless and harmless effluent, this treatment would not remove the harmful bacteria or the discoloring properties.

It is true that the trunk sewer would discharge in New Jersey waters and affect New Jersey shores as truly as it would New York, but the Jersey shore of upper New York bay is much shorter than the New York shore and the two are put to entirely different uses.

New York would suffer infinitely greater injury than New Jersey.

With regard to the South Brooklyn sewer, it should be remembered that it was made very large in order to carry storm water as well as house drainage, while the Passaic sewer would accommodate only house drainage and manufacturing waste. The Brooklyn sewer, moreover, was built before New York had begun its restrictive measures.

As to the Bronx sewer, the same objections have been urged against it by the commission as against the Passaic Valley sewer. Each has been made the subject of a special study and fully described in a special printed report, copies of which may be obtained at the office of the commission, 17 Battery place, New York.

The need for purifying the Passaic and Bronx valleys has never been questioned by the Metropolitan Sewerage Commission. It is only the proposed methods of accomplishing this with which it takes issue. In each case the trunk sewer would benefit some communities at the expense of others. In neither is the discharge of crude or practically crude sewage into the harbor necessary—there are other ways of dealing with the problem and, the commission asks, if the sewage of the Passaic Valley is to be adequately purified, why not discharge it directly into Newark bay in Jersey waters, and save the expense of a tunnel from Newark to Robbins Reef?

The alternatives mentioned as confronting New York are new. No trustworthy estimates of fifty million dollars or one hundred million dollars or any other sums for such work have been made.

The statement that there is no successful example of sewage purification anywhere is an error. References to the experience of cities on this subject can be found in many books of which the following are a few: Sewage Disposal Works, by Raiks, 1908; Sewage Disposal, by Kinnicutt, 1910; Principles of Sewage Treatment, Dunbar and Culbert, 1908.Ed.]

FIGHTING FOREST FIRES

To the Editor:

In view of the recent disastrous forest fires, which have occurred in all parts of the country, and which seem to be handled in a primitive and inadequate manner, I offer a suggestion which may be of some use.

There are on the market a number of so called fire destroying powders, known as "Kilfyre," "Pyricide," &c. These are furnished in various convenient shapes for handling and on demonstration have proved very effective in a small way.

Is it not perfectly feasible to use these powders, which I understand are not very expensive, in a larger way, for the prevention of the spread of such conflagrations as have recently devastated large areas of country? It is conceivable that they could be laid in packages in the advancing track of a forest fire, or even that they could be thrown from considerable distances by mortars or other artillery. Again, they could readily be placed in rockets which are thrown from a considerable distance, and safely handled in a holder made of a section of tin pipe.

In view of the great interests at stake, including the preservation of human life, experiments on the above lines should surely be undertaken by both our state and national officials.

Not only the forest service, but our army and militia would be well employed in such an undertaking.

Joseph D. Holmes.

Orange, N. J.

SOLITARY CONFINEMENT

To the Editor:

The terrible ending of Luccheni, who murdered the Austrian Empress Elizabeth twelve years ago and has just died in Geneva, is only another proof, if proof there need be in this our day of advanced knowledge, how fiendish it is to condemn any man to solitary confinement for life. It is mistaken humanity to consider it preferable to death. One of the editors of the New York *Times* thus comments upon it: "Prolonged solitary confinement, however mitigated, is a terrible, indeed a horrible, thing, and that it should be inflicted upon any criminal, no matter how atrocious, in a country that recoils from capital punishment as intolerably barbarous is only another evidence of how inconsistent sentiment can be when it turns into sentimentality. Capital punishment can be defended fairly well as either necessary or expedient, but solitary confinement is a return to the days of torture and disgraces those who impose it even upon a Luccheni."

I copy textually the statements made above and I give them my unqualified endorsement. I hope and pray that any such punishment may soon be unheard of in New York or elsewhere in the United States.

Beveriy Robinson, M.D.

New York.

THE SURVEY BARRED

To the Editor:

After receiving your package of sample copies I could not consistently place them on our state fair literature table as I discovered it advocated the dance. Our purity books on the table did not. The samples you first sent contained nothing discordant to our work or I should not have ordered others.

Mrs. ———.

———, South Dakota.

JOTTINGS

Buffalo Children's Aid Work.—The Buffalo Children's Aid Society founded in 1872, which has confined its work hitherto chiefly to a newsboys' and bootblacks' home, now in a beautiful new building on Delaware avenue in charge of W. A. Cleaver, began on October 1 to do the usual sort of aid work for children in their homes, under the direction of Arthur Folks, who was made general secretary. In some ways work for children has been backward in Buffalo, but public opinion is intelligent and ready and it is expected that Mr. Folks will develop a strong society. For two years he has been secretary of the Pennsylvania Children's Aid Society. He was born at Pulaski, Mich., in 1881, was graduated from Albion College in 1904 and was a public school superintendent until 1907 when he entered the New York School of Philanthropy. He is a son of Charles Folks, a prominent member of the Michigan Legislature for a number of years, and a nephew of Homer Folks of the New York State Charities Aid Association.

ARTHUR FOLKS.

• • •

Miss Baylor Goes to California.—Margaret Baylor, well known for her work in Cincinnati at the Associated Charities, the Union Bethel, and as superintendent of the Anna Louise Inn—the home for business girls which was run without rules—has recently become head worker of Neighborhood House, Santa Barbara, Cal. The settlement has recently acquired an adobe house which will be restored in the style of the early Spanish residences. It opened the first free bath house for sea bathing on the Pacific coast.

• • •

New Jewish Workers in Baltimore.—Mr. and Mrs. Max Carton, formerly head workers of the Council Educational Alliance of Cleveland, O., are now head workers of the Jewish Educational Alliance of Baltimore.

• • •

Chief Probation Officer, St. Louis.—As a result of a competitive examination, the general session of the Circuit Court has appointed Hugh M. Fullerton, chief probation officer of the St. Louis Juvenile Court, to succeed Roger N. Baldwin who resigned to become secretary of the Civic League. By his experience as deputy probation officer and by university preparation and keen interest in the work, he is well qualified for the place.

Conferences on Dependence.—Four conferences on social service will be held this year at the Free Synagogue, New York, of which Stephen S. Wise is rabbi. The general subject will be Phases of Life in Relation to Dependence. The first meeting at which Lee K. Frankel presided, was on Industry and Dependence; John Martin and Owen R. Lovejoy gave papers. On January 3, the subject will be Housing and Dependence, with Henry Morgenthau presiding and papers by Tenement House Commissioner Murphy and J. A. Cantor, former president of the Borough of Manhattan. On March 7, the subject will be Sickness and Dependence, with Dr. G. G. Fischlowitz presiding and papers by Dr. James Alexander Miller of Bellevue and Rabbi Sidney E. Goldstein. On May 3, Dr. A. M. Alder will preside at a meeting on Delinquency and Dependence, with papers by Secretary Robert W. Hebberd of the State Board of Charities and Secretary O. F. Lewis of the New York Prison Association.

• • •

Maine Prison Legislation.—The Maine Prison Association will present to the incoming Legislature a bill embodying the principles of the Juvenile Court in a form consistent with existing statutes. The bill has been drafted at the request of the association and the Maine Conference of Charities and Corrections by George E. Fogg of Portland, after consultation with Judge Ben B. Lindsey, Bernard Flexner and Hastings H. Hart, as well as with local judges in Maine. The Maine Prison Association, now in its third year, has caused the introduction and extension of the probation system in Maine and been instrumental in numerous reforms in county jails. It is at present engaged in a campaign of education for county farms for inebriates, a state reformatory for women and a state reformatory for young men, as well as for the adoption of the indeterminate sentence.

• • •

Ireland's Death Rate Lower.—At a recent meeting of the Women's National Health Association of Ireland, the Countess of Aberdeen announced that the death rate from tuberculosis, which remained stationary during 1905, 1906 and 1907, showed a slight fall in 1908, and a still more decided decrease in 1909. According to advance figures from the registrar general, the total of deaths from all forms of tuberculosis in 1909 was 10,594, as against 11,293 in 1908, and 11,679 in 1907, a decrease in the two years of 1,085. The death rate per 1,000 in 1907 was 2.7, in 1908, 2.6 and in 1909, 2.4. The 1909 rate is the lowest recorded rate for Ireland in thirty-five years. The fact that an energetic campaign for health has been carried on in the last five years seems to account for the fall in the death rate.

Is Crime Increasing?—An investigation of the number of criminals, mental defectives, epileptics and degenerates is being conducted in Massachusetts by a commission appointed by Governor Draper. Dr. W. E. Fernald is chairman and the other members are Capt. H. M. Blackstone, Dr. Everett Flood, Gen. B. F. Bridges and Dr. E. V. Scribner, secretary. A report will be presented to the legislature not later than January 15. The commission has collected what statistics are available and has begun an inquiry concerning the relative frequency of crime, pauperism and insanity now and twenty and forty years ago. The money appropriated by the Legislature for the investigation does not permit of extensive field work.

* * *

Anti-Cigarette League in New York.—The Anti-Cigarette League of America has recently begun work in New York with Judge Leroy B. Crane as chairman of a committee of one hundred in charge and the Rev. Manfred P. Welcher, 156 Fifth avenue, as field secretary and lecturer. The usual propaganda work will be carried on, with a "million club" pledged not to use tobacco, as the first goal. Mr. Welcher announces that new legislation will be sought later, including a state prohibitory law. The laws of 1889 made it a misdemeanor to sell or furnish tobacco to a child under 16. In 1890 a new clause was added by which the child himself is guilty of a misdemeanor if he uses tobacco in a public place.

* * *

Not Built on the Sand.—It is not without significance that the Presbyterian Church of the Sea and Land, New York, has recently completed a new church house on the site of its old Sunday school house at 61 Henry street. It means that although there may be a movement on the part of many churches away from the crowded districts of the lower East Side, this church is definitely committing itself to work there for many years to come. The building contains a gymnasium, first aid room for the use of the district nurse, a room for the cooking classes, a kindergarten room, a large assembly room for such purposes as prayer meetings, Sunday schools, lectures, sewing schools, separate club rooms for men, boys, and girls, a settlement floor for the women workers of the church, and a roof garden.

* * *

Baby Clinics in Texas.—The Woman's Charity Association of El Paso, Tex., has been successfully conducting a "baby clinic" and classes for mothers. Miss Franklin, the secretary, has done similar work with the Association for Improving the Condition of the Poor in New York and has found it possible to utilize that society's methods in this southwestern community. The infant death rate was excessive, especially among the Mexicans. El Paso is near the border and has a large Mexican population who are living under most unsanitary conditions. Comparatively little interest has been taken in improving conditions among them. The visiting nurse who works with the clinic has a chance to visit the homes and instruct the mothers how to improve their general standards of living as well as how properly to care for the babies. This work has the co-operation of the city medical authorities as well as the support of the public.

* * *

Economic Prizes.—For the seventh year prizes of $1,000, $500, $300 and $200 are offered for the four best studies in the economic field on topics relating to commerce and industry. The two largest prizes are open to all contestants and the two smaller prizes to undergraduates of American colleges. The committee in charge is composed of Prof. J. Laurence Laughlin of the University of Chicago, chairman, and Professors J. B. Clark of Columbia, Henry C. Adams of Michigan, Edwin F. Gay of Harvard, and Horace White of New York. A list of the subjects and conditions—the contest closes June 1—may be secured from Professor Laughlin. The money for the prizes is furnished by Hart, Schaffner and Marx, Chicago.

* * *

Unitarians Appoint Commission on Social Reform.—The American Unitarian Association at its annual meeting last May authorized the appointment of a commission on the church and the social question. The president of the association, Rev. Dr. Samuel A. Eliot of Cambridge, has recently selected the fifteen members. The list is headed by the name of ex-Congressman Horace Davis of San Francisco, and includes among others Prof. Francis G. Peabody of Cambridge, former Mayor Thomas M. Osborne of Auburn, N. Y., president of the George Junior Republic; Judge Reuben E. Walker of Concord, N. H., of the New Hampshire Supreme Court; Rev. Grover G. Mills of Watertown, mover of the resolution under which the commission is appointed; Edwin D. Mead of Boston, Dr. John Graham Brooks of Cambridge, William H. Sayward of Dorchester, secretary of the Master Builders Association; Henry Abrahams of Boston, secretary of the Cigarmakers' Union, and Frederic Almy of Buffalo, secretary of the Charity Organization Society. Rev. Elmer S. Forbes of the department of social and public service of the association will act as secretary of the commission.

GENTLEMAN desires position in this city with some association engaged in philanthropic work or social betterment. Business experience. Also has devoted years to friendly visiting, charitable aid and similar activities. Address

THE COMMON WELFARE

GARDEN CITY PLATTED BY RUSSELL SAGE FOUNDATION

The Russell Sage Foundation announced this week the early opening of a garden city, similar in design to the English types which are being copied all over Europe. It will be called Forest Hills Gardens, and will be at Forest Hills station, near Jamaica, nine miles in distance and thirteen minutes in time from the Pennsylvania Terminal at Seventh avenue and Thirty-fourth street, New York, by a new line of the Long Island Railroad through the East river tunnels. It will combine one- and two-story houses in blocks with detached houses, most attractively laid out with parking and trees, designed to meet the needs of families on moderate salaries whose homes in New York are restricted to the dreary discomfort and homeliness of the typical "flat," midway between the tenement and the higher-priced apartment.

The following outline of the Foundation's plans is taken from a statement issued by Robert W. deForest, the vice-chairman:

"Forest Hills Gardens is a business investment of the Russell Sage Foundation. It will be conducted on strictly business principles, for a fair profit. Houses will be built, sold and rented. Lots will be sold under protective restrictions intended to ensure to their owners and to adjacent owners the residential advantages of the neighborhood. In its business purpose Forest Hills Gardens does not differ materially from other Long Island real estate enterprises. It is not a charity. It will not be managed as a charity. Whoever deals with it, whether as tenant or purchaser, will be expected to pay fair value for everything received.

"Notwithstanding this emphasis on the business side of the enterprise, a distinct educational purpose exists. Not but that the Russell Sage Foundation might wisely and properly make a pure business investment of this character, but that a business investment with an educational purpose is more appropriate.

"Mrs. Russell Sage, and those whom she has associated with her in the Foundation, have been profoundly impressed with the need of better and more attractive housing facilities in the suburbs for persons of modest means, who could pay from twenty-five dollars a month upward in the purchase of a home. They have thought that homes could be supplied like those in the garden cities of England, with some greenery and flowers around them, with accessible playgrounds and recreation facilities, and at no appreciably greater cost than is now paid for the same roof-room in bare city streets. They have abhorred the constant repetition of the rectangular block in suburban localities where land contours invite other street lines. They have thought, too, that buildings of tasteful design, constructed of brick, cement or other permanent material, even though of somewhat greater initial cost, were really more economical in their durability and lesser repair bills than the repulsive, cheaply built structures which are too often the type of New York's outlying districts. They

Donahey in Cleveland *Plain Dealer*.

have hoped that people of moderate income and good taste, who appreciate sympathetic surroundings but are tied close to the city by the nature of their occupation, might find some country air and country life within striking distance of the active centers of New York.

"If these expectations can be realized at Forest Hills Gardens the Sage Foundation will accomplish several objects. It will provide more healthful and more attractive homes to many people. It will demonstrate that more tasteful surroundings and open spaces pay in suburban development, and thereby encourage imitation. It will encourage more economical methods of marketing land. It will secure an attractive income for the Foundation.

"Forest Hills Gardens is a tract of 142 acres. It has been laid out by Frederick Law Olmsted, as landscape architect. Its architectural development is in charge of Grosvenor Atterbury. Its adviser on the practical business side is William E. Harmon of Wood, Harmon and Company. Edward H. Bouton, president of the Roland Park Company of Baltimore, is its vice-president and general manager. Associated with these gentlemen on the development committee are John M. Glenn, general director of the Sage Foundation, Alfred T. White and myself, two of its trustees. Careful and comprehensive initial layout; attractive, substantial, durable building; experienced management, are the keynotes of the enterprise. No initial outlay has been spared on roads, water supply, sewers and other fundamental features which make little show above ground.

"Lots of various sizes and variously located on paved, sewered and tree-planted streets will be placed on private sale as early in 1911 as possible, on which buyers may build their own houses in harmony with the general plan of development."

CIVIC ADVANCE IN CHICAGO ELECTION

Men not only, but measures of large civic importance, were put to the test of popular approval when the ballots were cast last week in Chicago and Illinois. THE SURVEY has pointed out[1] that the struggle of citizens to purge the state Legislature of corruption invoked not only a fight against the "jackpotters" who ran as candidates, but a campaign of education in support of the three questions of public policy proposed by the Peoria conference and put to referendum vote. Other propositions submitted to referendum vote in Chicago or in Cook county involved significant steps in social betterment.

So far as legislative condidates are concerned, the election resulted in the defeat of nine men who voted for Lorimer for United States senator. These, added to the twenty-four who were beaten at the primaries and the thirty-one who did not run, constitute a large proportion of the 108 who voted for Lorimer; nevertheless three were re-elected of those named in the criminal prosecutions as participants in the bribery.

Widespread satisfaction is expressed at the sweeping victory for the three propositions urged by the committee of seven of the Peoria conference—the extension of the merit system in civil service, a corrupt practices act, and the initiative and referendum. On the basis of returns still incomplete it appears that the favorable vote was in the proportion of about four to one. The civil service reform associations of Chicago and Illinois have already started to prepare two bills, one covering the state and the other Cook county. Thirty-two state departments, offices, commissions and institutions will be affected, including all the penal institutions, the free employment offices, the factory inspection department, the Board of Health, and the park commissions. The bills dealing with corrupt practices and the initiative and referendum are also receiving careful attention.

In Cook county a bond issue of $3,000,000 was voted for the rebuilding of Cook County Hospital. This will mark an advance in the care of unfortunates not less important than the provision several years ago of an up-to-date hos-

[1] See THE SURVEY for September 3 and October 1.

pital for the county's insane and of a new infirmary for the poor which is nearing completion at the present time.

Three or four new recreation centers in Chicago were assured through the affirmative vote on the $1,000,000 bond issue proposed by the West Chicago Park Commission, which is already maintaining three recreation centers established by a [illegible] bond issue of $1,000,000. This increase of the recreation facilities on the west side will do much to bring small parks of the type which has been developed by the South Park Commission to the section of the city which needs them most.

Drawn for The Survey by A. A. Root.

The great outer parkway and forest preserve, originally proposed in the Metropolitan Park Commission report of 1904 and an important part of the Chicago Plan formulated by Daniel H. Burnham and presented to the city by the Commercial Club, was brought one step nearer realization by the election. By the overwhelming vote of 120,818 to 30,407 Cook county becomes a forest preserve district, and an official commission is created under the state law passed in 1909. The five members are to be appointed by the president of the county board for a four-year term, and no more than three of them may be of the same political party. It will have the power to issue bonds up to one per cent of the assessed valuation of property in the county, and to levy taxes up to one mill on the dollar of assessed valuation.

An injunction suit, challenging the constitutionality of the forest preserve law has been brought by "a citizen and a tax payer," who is also a saloon keeper. He contends that the law allows the authorities too much latitude. It is generally believed that his suit is merely a piece of politics. The present republican president of the Board of Cook County Commissioners, having failed of re-election, goes out of office on December 5, giving way to a democratic successor. As the president of the county board is authorized to appoint the forest preserve commissioners, it is more than likely that the real purpose of the injunction suit is to delay matters so that the appointments can be made by the incoming democratic president. In any event the constitutionality of the law will have to be tested in the courts before bonds can be sold.

In Grand Rapids, Mich., a bond issue of $200,000 for playgrounds was carried by a good majority after a vigorous campaign which involved many meetings and the enlistment of newsboys. Cincinnati voted for bonds of one million dollars for parks and playgrounds.

THE "YES" VOTE ON THE HARRIMAN PARK

The people of New York state acted favorably at the recent election upon the question submitted to them, authorizing a state appropriation of $2,500,000 for the proposed park along the Hudson and in the Highlands, and thus securing the gifts of Mrs. E. H. Harriman and of other philanthropists. While this had been expected, there is a peculiar significance in the fact that the vote was overwhelmingly favorable and no open opposition was expressed. There was a time when the proposition to expend such a vast sum of money for a public park, apparently remote, would have been laughed at and rejected, or at least would have fought its difficult way against the

opposition of those who cried "economy."

One of the strong appeals made by the successful party in the last campaign in New York state was for a more economical expenditure of money, but while the candidate was urged to state in what ways greater economy could be secured, at no time was mention made of the fact that $2,500,000 could be saved to the state by closing the park. In short, the vote was new proof that the people have reached a point where they appreciate park properties. While this special domain, royal in its nature, becomes property of the state very largely through the instrumentality of Mrs. Harriman, it foreshadows a time soon to come in the development of park interest, when the initiative for securing such property shall no longer come from private philanthropists, but entirely through the people themselves. As to whether such an interest shall be speedily awakened or not depends largely upon the use made of the park, now happily assured.

In a city the size of New York, with more than 4,000,000 people, there is a very large number of families on small salaries, fond of outdoor life, careful of their surroundings, and appreciative of opportunities for healthful enjoyment during the summer. A few of this type find their summer outing in the city park system at Pelham Bay Park, where a most successful camping colony has been located for a number of years. This group was never more appreciative than during last summer under the administration of Commissioner Higgins. Where one family secured the much coveted permit, however, a hundred were refused for lack of accommodation. Should part of the development of the huge state park be especially adapted for this class of citizens, there would be no question about its value as a social agency or of its endorsement by people at large, or of the desire for similar parks near other large cities.

It is to be noted also that the state is gradually acquiring a very considerable park area, its reservations greatly varying in size, scattered through different sections of the state. Not more than one or two further gifts or acquisitions will bring prominently before the people the necessity of forming a state park department or bureau.

It is understood that plans are already under way for developing the properties so as to give largest service to the public in Harriman Park.

NEWSBOYS ELECT THEIR OWN JUDGE

During 1909, three hundred Boston newsboys were brought before the Juvenile Court for violation of license regulations. With 4,000 other cases already on its hands the troubles of the newsboys added greatly to the burden of the court, and last June the boys themselves petitioned the School Committee to establish a Newsboys' Court to deal with all infractions against the regulations governing their trade. The School Committee ordered that the plan be put into effect, and on the very day their elders were voting for governor and congressmen the "newsies" were balloting for juvenile judges who, with the assistance of two adults, will act as a trial board for all cases of infraction of newsboy licenses. The judges elected by the boys are Harry Hornstein, Jacob Rosen and Louis Gray. With them will sit Mitchell Freiman as chief judge and Alexander J. Peckham, secretary of the Boston Newsboys' Club, which is chiefly responsible for the new board. Both of the adult judges were appointed by the School Committee.

The election by the boys will be held annually and all licensed newsboys attending the public schools are qualified electors. The board has power to investigate, make findings and recommendations to the School Committee for all violations of newsboy licenses. The supervisor of licensed minors, Philip W. Davis, can at his discretion bring complaints before this board instead of before the Juvenile Court. The police commissioner will instruct the officer now specially detailed for these offenses to co-operate so far as possible with the new trial board, which has jurisdiction over all

newsboys attending Boston public schools. The newsboy judges will receive a salary of fifty cents for each session of the court.

HEINSHEIMER BEQUEST TO NEW YORK FOUNDATION

The New York Foundation, chartered to "promote charitable, educational and philanthropic enterprises," has been endowed by Alfred M. Heinsheimer with the gift of one million dollars which reverted to him from the estate of his brother Louis when the Jewish Charities of New York failed to federate and secure it under the terms of Louis Heinsheimer's will. The board of trustees consists at the start of Morris Loeb, president; Alfred M. Heinsheimer, vice-president; Paul M. Warburg, secretary-treasurer; Jacob H. Schiff and Isaac N. Seligman.

The trustees announce that "the income can be expended for the promotion of any educational or charitable objects that commend themselves to the trustees, preferably in co-operation with established institutions, but they are not expected to extinguish deficits due to a failure of the public to supply the running expenses of societies which should properly depend upon membership dues or annual contributions. No application for appropriation will be considered by the board unless made in writing, over the signature of a responsible officer of the organization in question, and addressed to the president of the New York Foundation, 52 William street."

SETTLEMENT OF EXPRESS STRIKE

After one rejection of the terms offered them by the express companies, the New Jersey expressmen have, on a second vote, ratified the New York men's acceptance of the concessions obtained through the mediation of Mayors Gaynor and Wittpenn and Henry R. Towne, president of the Merchants' Association of New York.

The terms were, briefly, the open shop with no discrimination against union men except those who have been guilty of inciting to violence during the strike. Wages and hours are to continue as before until December 1, after which a committee of the men is to meet with a committee of the express companies and arrange a new scale of hours and pay. In case of inability to agree on terms the question will be referred to the present arbitration board, consisting of the two mayors and Mr. Towne.

STATE COMMISSION ON THE DISTRIBUTION OF POPULATION

One of the last acts of Governor Hughes before leaving Albany for Washington was the appointment of an unpaid commission of twelve members to study methods of distributing population in New York state. The members are Adelbert Moot of Buffalo, chairman; V. Everit Macy, treasurer; Prof. Liberty H. Bailey, dean of the State Agricultural College; Lewis Stuyvesant Chanler of Barrytown; John Mitchell, W. N. Giles, secretary of the State Grange; Mrs. Florence Kelley, secretary of the National Consumers' League; Mrs. V. G. Simkhovitch, head of Greenwich House; Dr. Antonio Stella, president of the Italian Immigrants' Aid Society; Cyrus L. Sulzberger, president of the United Hebrew Charities, and Rabbi Stephen S. Wise of the Free Synagogue; Benjamin C. Marsh, secretary.

The commission has held a preliminary meeting for organization. Each member has taken a subject to study and will report at the next meeting, to be held in New York on December 6, what lines of investigation will be feasible. The scope of the work is indicated by these inquiries:

Nature and permanency of employment in small towns and country districts, including seasonal trades, and the need for a state employment bureau;

Living conditions, housing accommodations, rent and ownership of homes; educational conditions in cities and country districts; length of school term; nature of instruction—especially agricultural and industrial; physical conditions of schools; recreational and social opportunities;

Standard of living in various localities;

Feasible methods of distributing factories;

Roads, transportation, and communication;

Immigration, and distribution on racial lines;

The removable influences which hold people in congested districts; sweated industries; municipal and private charities;

Foreign methods of distributing population.

Albert Sudekum, a member of the German Reichstag, who is in this country for a few months, is making a report for the commission on foreign methods of distributing population.

The report of the commission, necessarily a preliminary one, will be made to the Legislature by February 1.

HEALTH CONFERENCE FOR WESTERN PENNSYLVANIA

A Western Pennsylvania Health Conference will be held for three days, November 29 to December 1, in Soldiers' Memorial Hall, Pittsburgh. The lines along which it is conceived and the practical application as the program proceeds of the principles and methods under discussion to the conditions and needs of city and district mark it as unique among hygienic conferences. It follows the example of the successful conference on the treatment of dependent children, which was conducted in April, 1909, by the Associated Charities of Pittsburgh. The present conference is held under the same auspices but with a special promotion committee numbering about 300 persons, of which Dr. William H. Murcer is chairman and Charles F. Weller, secretary. Among the out-of-town speakers will be Dr. Richard C. Cabot of Boston, Adelaide Nutting, director of Nursing and Health, Teachers College, William H. Allen of the Bureau of Municipal Research, Dr. Charles P. Emerson of Clifton Springs Sanitarium, Dr. Samuel B. Dixon, state superintendent of public health in Pennsylvania, Dr. W. A. Evans, commissioner of health, Chicago, and Dr. Sidney E. Goldstein, formerly of the staff of Mt. Sinai Hospital, New York.

People identified with hospitals, nursing associations and public health matters in neighboring cities and states could make no better investment than to attend these meetings. But it is in its local aspects that the conference has special significance. It is a concerted effort to bring together for co-operation, for the exchange of experience and for the possible crystallization of systematic schemes of service, representatives of all the hospitals, nursing associations, dispensaries, anti-tuberculosis forces, health departments and other agencies which deal with sickness and promote health in the Pittsburgh district. This is illustrated at the very outset of the conference, for the opening session will take up the question of the hospital equipment of the greater city—such points as, what funds are necessary for the support of all the hospitals of the Pittsburgh district, what beds are now provided for the various types of cases and how these provisions compare with usual needs; what are the present operations of the ambulance service in Pittsburgh; what is the need for differentiation of hospitals as to territory covered or cases treated; what the need for conference or agreements as to rates to be charged; for what charity cases is it especially hard, or impossible, to secure care.

It will be seen that these questions, if answered in the concrete, will be bound to transfer the basis of judgment from the individual success or service of a particular hospital to the relation of that service to the needs of the whole community. Other sessions will take up the dispensaries, the development of social service in connection with hospitals and health agencies, the relation between the work of specialized nurses and visiting district nurses, infant mortality and children's health agencies, the investigation and after-care of charity cases, and the education of the community in public health matters. When it is remembered that in the past there has been no effective co-operation between the hospitals of Pittsburgh, no co-ordination of visiting nurse work, no systematic mapping out of the ambulance service of the city, the constructive elements in the mere formulation of such a conference program, in which the health and hospital forces of the district are seen to be co-operating heartily, are plain.

HOSPITAL CO-OPERATION, EFFICIENCY, FINANCE

Moreover, the questions raised by this Pittsburgh Health Conference are questions which apply to every city in the country. As put forward on the program, they are so specific and pertinent that two series of them may well be published here—the session on Hospital Co-operation and that on Efficiency and Finance. Each theme is to be presented in a formal paper to be followed by a general discussion of each of the sub-topics.

General subject: Hospital Co-operation.

Theme: To what Extent is it Desirable and Practicable to Develop Means and Habits of Co-operation Between the Hospitals in the Purchase of Supplies, Relations with Employes, Admission of Charity Cases, Publication of Needs Encountered and Work Accomplished, and in the Holding of Conferences as to Common Problems?

Address

Would it be Advisable to Develop Some Central Purchasing Agency for the Buying of Hospital Supplies or the Securing of Bids?

Could Common Agreements be Developed as to Standards of Efficiency to be Observed and Compensation Paid to Employed Workers?

Should it be Possible to Learn Through a Central Agency at Any Time what Beds are Available, Where, for What Classes of Cases?

Should Joint Methods of Publicity be Developed to Help in Securing Adequate Public Interest and Support for all Needed Health Agencies and to Publish the Social Lessons Learned or Social Needs Observed?

Should Conferences be Held in which Representatives will Discuss (Without Any Formal Action Binding upon the Constituent Health Agencies) Difficulties, Problems and Successes Which Should Concern All?

Should Charity Cases be Confidentially Registered with a Central Office Through Which Information Essential to the Patients' Welfare May be Exchanged?

General Subject: Efficiency and Finance.

Theme: By What Standards or Tests Should the Work of Hospitals, Dispensaries and Nursing Agencies be Measured?

To What Extent and Under what Supervision should Financial Support be Provided from Public Funds?

Discussion:

Should the State Board of Charities or Some Other Agency Learn, Record and Publish the Essential Facts Concerning the Work of Hospitals and Other Health Agencies?

To What Extent and in What Way Should Public Supervision Accompany the Gift of Public Funds to Hospitals and Health Agencies?

Should State, County or City Appropriations for the Current Expenses of Privately Managed Hospitals and Agencies be Paid for Per Capita Care or Other Measured Service?

To What Extent and in What Way Should Public Authorities Determine the Admission of Cases to be Cared for at Public Expense?

How Should the Diverting of Funds to Unnecessary or Incompetent Health Agencies be Prevented?

How Should Adequate Financial Support be Secured for the Essential Hospitals and Health Agencies?

Milk and Ice Association.

Hospital Wards for Children.

Obstetrical Conditions and Their Improvement.

Sex Education and Hygiene.

The Prevention of Blindness.

PUT RESPONSIBILITY ON THE RIGHT SHOULDERS

LILLIAN D. WALD

Henry Street, (The Nurses) Settlement, New York

Out of the discussion that recently centered about Mr. Straus's determination to close his milk stations in New York has come a great deal of education. Many people, for the first time, have become aware of the significance of clean milk for babies.

The subject of milk supply has been brought into the open, and a very much needed discussion of the question of the life and health of the babies of the poor in the city, has focused attention upon a basic principle—namely, the fixing of responsibility for infant mortality.

The budget appropriation of $40,000 to the Department of Health (in excess of the regular appropriation) for the purpose of establishing fifteen infant milk depots, with equipment and machinery for distribution, nurses and physicians for instruction and supervision, is an im-

portant step, and at last begins to meet the question of where the responsibility belongs.

The city owes a great debt to the good people who have brought this question to the front, and there is now a conviction on the part of many that in the light of full knowledge, there is no justification in the willingness of the community as such to permit individuals to assume longer the responsibility for its infants' milk supply and logically, therefore, for its infant mortality. Indeed there is a grave ethical question involved and the city, in making its appropriation, has taken its proper and dignified position. This is the beneficent result of the milk agitation which began in the unfortunate and wholly unjustifiable criticism to which Nathan Straus had been exposed. Through his milk stations, the New York Milk Committee and the Diet-Kitchen depots, almost 5,000 quarts a day are distributed; and its demonstrated usefulness has been given wide attention by the discussion.

Commissioner Lederle of the Department of Health has not yet completed his arrangements for the municipal milk stations, but his plan is said to be to place the stations in the various boroughs of the city of New York and to permit under his guarantee the sale of milk suitable for babies. Numerous private individuals are said to stand ready to supply the 1,500 quarts which could be used by the new stations under the administration of the Department of Health. Whether this milk comes at first through the efforts of altruistic private individuals or from the dealers in milk, the first important step has thus been taken to fix the responsibility where it properly belongs—namely, upon the city. Whether these sources of milk will prove permanently satisfactory or not, need not now confuse the public. The policy has been established of holding the city responsible for the quality of the milk which its babies drink, and if it should follow that neither the altruistic private individual nor the honorable milk dealer can permanently or adequately meet this need, the city may have to produce its own milk as it now produces its vaccine and its anti-toxin.

The city has long since held its Department of Health responsible for providing clean water that its citizens may be guaranteed against typhoid and diseases traceable to an impure supply. Infant mortality, through diarrhoeal diseases, can be as definitely controlled by guaranteeing the milk supply, as typhoid fever mortality can be diminished or eliminated through pure drinking water.

In conjunction with the bureau of child hygiene of the Health Department, the distribution of milk in these stations can be perfected. Whether the milk sold in the municipal milk stations is provided by private individuals or business concerns, it must be supplemented by instruction and supervision in the homes and preferably by the city's representatives.

At one milk station in New York where the milk is known to be pure, one nurse took care of 240 babies under two years of age from January 1 to November 1, 1910, teaching the modification or the pasteurization in the homes according to the individual formula prescribed by the physician for each child. Once a week the mothers and babies have been in conference with the physicians at the settlement which has charge of this dispensary. Though those who received the milk were the undernourished, the underweight, and the marasmus infants, there were only two deaths from diarrhoeal diseases in ten months.

The city of New York will learn that it is less expensive to save the babies than to let them die. Such has been the experience in Rochester, at Copenhagen and the various communities in Europe and America which have carried out a responsible policy concerning their infants' milk supply.

November 26, 1910.

RECENT CONFERENCES

SAVING THE BABIES

ROBERT W. BRUÈRE

Out of a maelstrom of enthusiasm and erudition, the first annual meeting of the American Association for Study and Prevention of Infant Mortality issued with a largely increased membership and a fairly definite program for the work of the coming year. I doubt whether many delegates to the meeting perceived the dim evolution of that program through the rushing succession of papers that, session after session, left even the most eager spirits dazed and exhausted. With the refreshing exception of Hastings H. Hart's section on philanthropic prevention of infant mortality — which Dr. Hart wisely limited to two papers in addition to the chairman's address, with the delightful result that the speakers presented their subjects without nervousness, and the discussion from the floor was animated and effective—the programs were seriously overcrowded, and therefore, in spite of their intrinsic excellence, confusing rather than constructively helpful. There was, nevertheless, a central drift to the meeting, which took permanent form in a body of five resolutions, to the execution of which the association will direct its energies during the coming year.

The first of these deals with the establishment of a national department of health. In the opening session Prof. Irving Fisher described the sinister commercial influences that are hypocritically hampering the establishment of the national department under the pretense of safeguarding "medical freedom," and showed how such a branch of the federal government might become a supremely efficient instrument in the promotion of all those matters of public hygiene and legal enactment upon which the reduction of infant mortality depends. The association went unanimously on record as "endorsing the movement for a national department of health, in the belief that the establishment of such a department will lead to great reduction in infant mortality, not only through improved regulation of interstate commerce in milk, infant foods, and medicines, but also through wider dissemination of information upon the causes of infant mortality and their prevention."

The second resolution was inspired by Dr. Cressy L. Wilbur's admirable report of the committee on birth registration. The Bureau of the Census at Washington, of which Dr. Wilbur is chief statistician, displayed exemplary interest in the work of the association by having ready for distribution Bulletin 108, embracing the infant mortality statistics for 1909, the precise subject and matter of the committee's report. This bulletin reveals the gross deficiencies in our American methods of registering births and deaths, and makes it clear that without a comprehensive and scientific system of "human bookkeeping" our efforts to locate and attack the causes of infant mortality must remain scattered and abortive. Dr. Wilbur cited the Pennsylvania law and its enforcement by the Pennsylvania authorities as worthy of emulation, declaring at the same time that the system of registration in Baltimore was probably the worst in the civilized world—with those of Chicago, St. Louis, New Orleans and most other American cities close seconds in the unenviable competition. The association pledged itself to the promotion of the "model law for the registration of births and deaths as recommended by the American Medical Association, the American Public Health Association, and the United States Bureau of the Census, and the enforcement of registration laws by the officials charged with their execution, and the prosecution of physicians and midwives who neglect their duty to their clients and to the public health by neglecting to register births as required by law."

In this connection it should be remarked that the medical men attending the meeting, whose judgment was voiced by Dr. William H. Welch, president of the American Medical Association, were

unanimous in declaring that the midwife must be recognized as an established American institution, and that the traditional folly of ignoring her presence and failing to provide for her suitable education and supervision must be made an end of. This vigorous action was provoked principally by the interesting report of Carolyn C. Van Blarcom, of the committee on the prevention of blindness of the New York Association for the Blind, revealing the extent to which the delivery of children is in the hands of midwives not only in our cities, but also in the rural districts, and showing the dire consequences of our characteristic American shiftlessness in this matter. To formulate a definite policy upon the subject of midwifery, the association created a special committee, with power to act during the coming year and with instructions to report upon its work next November.

The third resolution, like the first two, looks to the co-operation of a federal department. It is addressed to the secretary of agriculture, upon whom it urges the establishment of official standards for milk "branded as certified, inspected, or pasteurized" and the enforcement of such standards in interstate commerce.

The two remaining resolutions incorporated the gist of much that was most illuminating in the discussions of the association. Thanks chiefly to the women who addressed the convention, the subject of sex instruction in the public schools and in normal schools and colleges received due consideration. The central theme of the convention was the need of safeguarding mothers from economic and industrial pressure, and of instructing them in the principles of healthy parenthood. What the public schools can contribute to this end was exhilaratingly suggested by Prof. Jessie Phelps of the department of biology in the Michigan State Normal College. Her paper was typical of the entire discussion, and accordingly I am going to quote briefly from my notes upon it:

> How is the Michigan State Normal College fitting its students to establish, through the public schools, better practices in hygiene and sanitation and higher ideals of parenthood? Our student body, like that of most colleges, and normal schools, comes to us unaware of the existence even of the problems of parenthood, infant mortality and health conservation.
>
> To enlighten them we have established three regular courses, one on infant diet, another on general hygiene, and a third on special physiology for women. We give sex instruction a broad scientific basis; we give it a biological and evolutionary setting; we make it natural. Such topics as masturbation, prostitution, syphilis and gonorrhea are handled briefly but frankly. Courtship, marriage, home-keeping, dress, women's work, the rights of children, and methods of instructing children in the fundamentals of sex life are considered. It goes without saying that all this work is presented without excuse or apology. We believe that if a child is early and correctly taught, he is much less likely than otherwise to fall into wrong practices. The old method of letting a child alone in his life explorations usually results in his finding, and that right early, only the distorted and untrue concerning matters of sex. Toward the close of the course in special physiology, a few round-table discussions are held, in which the young women eagerly take part, relating what they have seen in the classroom among the children, how they themselves were instructed in matters of sex, what they consider the proper attitude of lovers, married people, parents, children. As much time as possible is given to private personal conferences.
>
> Two hundred and fifty-one students have elected these courses, and nearly all are teaching. Many write me of what they are doing to instruct mothers and children. Some have established parents' meetings, and all from whom I have heard—some hundred—say that they are glad of their training in sex physiology; that they find constant use for it in school and society; that it has made for better personal hygiene and saner social relations. They declare that they are better guardians of children than they could have been without it.

The resolutions following upon this discussion were as follows: That the American Association for Study and Prevention of Infant Mortality urges (I) "Boards licensing teachers for public schools to give as detailed tests in elementary hygiene, sanitation and biology as are given in mathematics or in language," and (II) "State boards of education, together with state boards of health to provide, in the rural schools, for conferences of mothers, and for home instruction, in connection with these conferences, of mothers and expectant mothers in maternal and infant hygiene."

The association will hold its second annual meeting in Chicago under the presidency of Prof. Charles Richmond Henderson of the University of Chicago. Dr. Cressy L. Wilbur of the United States Bureau of the Census is president-elect for the year 1911-1912. The third annual meeting will probably be held in Cleveland.

VOCATIONAL GUIDANCE AND INDUSTRIAL EDUCATION

MEYER BLOOMFIELD

Two conventions held in Boston during the week past were of more than passing interest. The first National Conference on Vocational Guidance, called by the Boston Chamber of Commerce and the Vocation Bureau of Boston, opened its two days' sessions November 15 with nearly three hundred people crowding the room, and with delegates from thirty-five cities.

President Bernard J. Rothwell of the chamber told the company of the business man's interest in the conservation of youth's energies by expert vocational counselling at the critical period before boys and girls leave school for work.

Prof. Paul H. Hanus, head of the department of education in Harvard, outlined the foundations on which proper vocational guidance must rest. "This movement", he said, "has nothing to do with phrenology or psychology, but deals with its problems in a practical, common sense way. One large aim in vocational guidance, he pointed out, is to develop the methods and material by which the public schools may help fit their individual graduates for the work they are likely to do, and in this effort to use all the spiritual, economic, educational and other agencies which may co-operate to bring about the fullest information and the best suggestions. He warned against "prescribing" vocations, and the curtailing of the child's privilege to enjoy the most liberal opportunities for growth and happiness that the schools can provide. Nevertheless it has become necessary to face the future problems of thousands of boys and girls who must leave school at fourteen, and the time has come for the establishment of a service that would help parent, teacher, and child in wisely planning for a life work, and for making demands upon commerce and industry in the direction of a better investment of youth's powers in the field of wage-earning.

Mayor John F. Fitzgerald spoke on the need of making education definite enough to inspire an interest in efficient life work, "not merely for the few who go to high school or college, but for the vast majority whose school life ends and whose working life begins at fourteen or fifteen."

President Emeritus Eliot's address was on the adjustment needed in the common school education to stimulate the life career motive.

> School life should enable the boy to say, "I can." In the higher institutions of learning where formerly students listened to lectures by the hour, doing nothing, they now spend their time in laboratory work. So the elements of many trades should be brought into the elementary schools—not to train for a particular calling, but to train and develop the mind in a broader sense. This will cost a great deal of money, for no education is so cheap as book education. Get the children to work because of their interest in work. The old idea that all that children got out of work was discipline is, I am happy to say, passing away. Vocational guidance must be developed on a large scale. It is not new. Benjamin Franklin's father took him around to the different industries of Boston and asked him what he liked best. He chose the printer's trade at the age of eleven—a fortunate thing for him and others. Something of this kind must be done in this plan of vocational guidance.

At the evening session Felix Adler, Charles Zueblin, and the director of the Vocation Bureau explained the significance of vocational guidance, and its ethical and economic implications. Dr. Adler said:

> The whole of life is vocational training. There is not a single culture study that you could not teach with art as an incentive. The whole system of our education will be changed for the better if this vocational motive takes root. Whenever a pupil shows a particular aptitude in one direction he should be given every opportunity to work along that line.

The addresses next day, by Prof. Chas. R. Richards, Samuel McCune Lindsay, F. P. Fish, Robert A. Woods, E. W.

Weaver of the Brooklyn High School for Boys, Supt. Stratton D. Brooks of the Boston schools, David Snedden, Florence Marshall, William Pear and others, added important contributions to the principles and practical steps in vocational guidance. A large audience was present at every session. Suggestions for a further conference and organization were made and the discussion of methods which arose received valuable assistance from Alice P. Barrows of the Russell Sage Foundation committee on women's work, Elsie Cole of the Manhattan Trade School for Girls, Paul Abelson and Henry Moskowitz of New York, and Jesse B. Davis of Grand Rapids. The closing address of Pres. Richard C. Maclaurin of the Massachusetts Institute of Technology at the final session fittingly confirmed the social vision, the educational insight, and the practical suggestions of the address with which Professor Hanus opened the conference. Said Dr. Maclaurin:

> Vocational guidance, as I see it, is to be of inestimable value because it will disclose what we need in vocational schools. It should drive out the undesirable in industry just as we drive out the undesirable citizen. We must make modern industry a part of the liberal education so as to give it a basis for vocational choice. Vocational guidance will react on all our educational systems, the industrial quite as much as the non-industrial.

The fourth annual convention of the National Society for the Promotion of Industrial Education was opened November 17 by the president, Charles R. Richards of Cooper Union, New York, with a paper on the growth of the industrial education movement and the significant demand now made upon the society for practical suggestions as to the best organization of this needed education. The first day's discussion was on the training of girls for stores and the trades, and the training of teachers for girls' schools. A summary of the papers read by Susan Kingsbury of Simmons College, David Edwards of the Chamber of Commerce, formerly the educational director of William Filene and Sons; Lucinda Prince of the Union School for Salesmanship, Edith M. Howes of the Girls' Trade Education League, Mary S. Woolman, and Florence Marshall, would do injustice to the closely reasoned and thoroughly practical contents of these valuable contributions. The national society will later publish them in full, and they will doubtless become a guide to those who are promoting the trade education of women.

The evening banquet at the Hotel Somerset was attended by more than four hundred men and women. Ex-Governor Curtis Guild, Jr., was toastmaster, and in addition to the notable list of speakers, including Pres. F. A. Delano of the Wabash Railroad, Acting-governor Louis A. Frothingham, Governor-elect Eugene N. Foss, C. H. Winslow, official delegate from the American Federation of Labor; F. P. Fish and the mayor of Boston, there were seated at the guest table George Kerschensteiner of Munich, ex-Comptroller Herman Metz of New York, Henry M. Leipziger, Prof. Paul H. Hanus, A. Lincoln Filene and Professor Richards. The keynote of all the dinner speeches was that the emphasis was laid on the boy to be trained quite as much as on the industry to be served by a system of industrial education. The Friday sessions of the convention were given over to papers on types of apprenticeship schools in large industrial corporations, the methods of training assistants and mechanics for railroad and similar enterprises, and the co-operative plans between the high schools of various cities and the leading industries of those cities by which boys can "earn and learn" at the same time, receiving a practical training in part-time shop work, and the necessary theoretical foundations in part-time school instruction.

On Friday evening Dr. Kerschensteiner spoke to a large audience on the Munich system of continuation schools. A city, the size almost of "proper Boston," as Dr. Kerschensteiner put it, was spending $400,000 annually to fit boys and girls for larger efficiency in the work by which they were earning their livelihood.

> The final aim of all schools maintained from public sources is to educate the pupil so that

he shall become a useful citizen, who by his own work directly and indirectly contributes to the attainment of the objects of the state. These objects are to regulate civic relations according to equity and justice and to afford to all citizens the possibilities of an active life in realizing ideals of moral value. The schools for the majority of citizens cease their work precisely where education through and in a particular trade begins, and therefore cannot promote trade efficiency and love of one's own profession in any way. Moral education is impossible where trade efficiency and love of work are absent.

Dr. Kerschensteiner's civic conception of industrial education was remarkably re-enforced by the addresses at the closing session on Saturday morning, when James P. Munroe, executive director of Boston-1915, Prof. Thomas Carver of Harvard, Elizabeth B. Butler of New York, and Howell Cheney, a prominent manufacturer from Connecticut, spoke on the Social Significance of Industrial Education.

Very properly, at the annual election of officers held by the national society, James P. Munroe was elected president for the ensuing year. His election is consistent with the tenor of the discussions throughout the sessions of the convention. From the opening remark by Professor Richards to the inspired and inspiring address of Mr. Cheney, a realization was present that industrial education would prosper best where the community needs and the social interests of the workers were included in the plan for securing more industrial efficiency. High-minded employers have joined hands with the educator, the social worker, and the representative of organized labor, in giving vocational training a social horizon. The two vocational conventions just closed have done much to clear misconceptions, from which no group has been wholly free, and to point out the way for future co-operation and development. The movements for vocational guidance and industrial education promise well, not because these enterprises are based on necessary individual service, but mainly because they are at one with the social philosophy of our day, which regards preventive work and social conservation the supreme duty of the enlightened citizen.

NEW YORK STATE CONFERENCE

ARTHUR W. TOWNE
ALBANY

The value of a state conference of charities was never better demonstrated than by the eleventh New York conference which met in Rochester last week. The attendance was good, the topics timely, the papers and discussions earnest, suggestive and full of encouragement. Education, prevention and thoroughness were the watchwords.

At the opening session George A. Lewis of Buffalo, the president, made a thoughtful and inspiring address on recent progress and the outlook for social work in the state. He sketched the wide range of movements in which the conference from year to year has been interested, referring, among others, to the development of state institutions for defectives, the necessity of public playgrounds, the boy scout movement, and the benefits promised through the formation of societies for sanitary and moral prophylaxis.

In speaking of the campaign against tuberculosis, Mr. Lewis declared that "victory all along the line, and the end of the struggle within twenty years, seem a measurably safe prediction." He praised the improvements in the humane and rational treatment of convicts in state prisons, citing the better sanitation of prisons, the abolition of stripes and the lockstep, and various other reforms. He commended the great progress made in training juvenile delinquents committed to the institutions at Hudson and Industry and said that in our attitude toward the delinquent child we have accomplished "some of the most radical and efficient reforms realized in any group of subjects in the past decade. The public has awakened to the fact that saving and sheltering of child life is the salvation and preservation of society."

While all of the sessions were well attended and characterized by keen interest, the two meetings probably to be remembered longest were those on congestion of population and on the social evil.

The report of the committee on sanitary and moral prophylaxis, of which Dr. W. M. Polk, dean of Cornell Medical College, was chairman, was reserved for the last evening. Dr. F. W. Sears of Syracuse declared it inconsistent to placard a house in which there is a case of German measles, and to refuse practically to do anything to protect the public from the ravages of syphilis and gonorrhea. It is wrong, he said, for the public to disregard debauchery among men, since it is such a prolific cause of suffering among innocent women and children. He urged that physicians endeavor to prevent young men who have venereal disease from marrying. The principal weapon he would use against the black plague, however, is education, and he would make the attack first of all through the home. The spirit of chivalry toward the other sex should be inculcated on boys. Dr. Sears also severely arraigned the practice of abortion, which according to his estimate occurs in two or three out of every ten pregnancies. This not only weakens the moral sense of women and produces invalidism, but causes about 6,000 deaths in the United States annually. Dr. T. H. Halstead, also of Syracuse, went a step further by advocating that physicians be required to report cases of venereal diseases to the public health authorities for registration. This would facilitate surveillance over those having these diseases, would secure valuable statistics, and the knowledge that venereal diseases are reportable would act as a strong deterrent, he said. The great majority of the victims of these diseases could have no just grounds for objecting to registration, for, as a rule, they contract the diseases through debauchery. Dr. Halstead advocated also that persons applying for a marriage license be required to present a certificate showing their freedom from venereal disease.

Mgr. William J. White of Brooklyn and the Rev. A. M. O'Neill of Rochester spoke on the moral and social aspects of the black plague, and urged that the church unite with the medical profession and laymen in a systematic, persistent campaign against prostitution. The former suggested short illustrated talks in factories during the noon hour, and pointed out, as did Dr. Polk, that overcrowding in tenement houses encourages this evil. Section 79 of the Page law, which provides for the medical inspection of convicted prostitutes, was defended by Robert W. Hebberd and Lawrence Veiller. Attention was called by the former to the fact that the number of beds set apart for cases of venereal diseases in the hospitals of New York city is inadequate.

On Wednesday evening the report of the committee and the papers on congestion of population provoked a lively discussion. Mrs. V. G. Simkhovitch, chairman of the committee, discussed the evils of congestion and the difficulty of relieving them. Cities and communities which do not yet have this problem to deal with should adopt proper preventive measures, she said. Following the report of the committee, Secretary Hebberd of the State Board of Charities read a paper on the work of the State Commission on Distribution of Population, in which he advocated improving the social conditions in rural communities as an inducement to families to remove from crowded city tenements in the city to rural places. Both Mr. Hebberd and Benjamin C. Marsh discussed the subject in its relation to land values and taxation, and recommended that New York be divided into zones, with appropriate restrictions concerning building in each zone.

Mrs. Florence Kelley directed her attack upon sweatshops and the existence of extensive charitable institutions in New York. She showed that the existence of sweatshops in crowded portions of the city encourages those working for the sweatshop to live in its immediate vicinity in order to save carfare and time, and that this results in overcrowding. She pointed out that many of the charitable institutions in New York occupy extensive tracts of valuable land which is needed for housing and other purposes. Her recommendations were the removal of factories and charitable institutions to places outside New York.

The positions taken by these speakers

were vigorously challenged by Lawrence Veiller, secretary of the National Housing Association, who thought that the evils under discussion were due not so much to having large numbers of people dwelling in a given area, as to improper planning and construction of the tenements and to the racial habits of the people. He argued that the previous speakers had not properly defined what congestion is, for there is a wide difference between acreage congestion and room congestion. He doubted the efficacy of removing factories and charitable institutions, and of trying to distribute population, because the people tend to follow the factory. John Martin made the closing address on the relations between congestion and rapid transit and summed up the evening's discussion.

In the session devoted to public institutions and public co-operation, Prof. Frank A. Fetter of the State Board of Charities explained why the almshouse lags behind in the forward march of our charitable institutions. The almshouse, he said, is "the black sheep in the philanthropic flock." The two principal explanations advanced were that the almshouse is not sufficiently specialized as to classification of inmates, and that it is conducted by the county, which is itself unprogressive. Among the measures suggested for improving conditions were:

Extension of civil service rules to all counties, appointment of superintendents of the poor instead of their election, something resembling specialty upon a single superintendent of the poor in each county, continued development of state care for defective classes, changing almshouses into hospitals and homes for the aged, replacing county almshouses by state district institutions, development of a system of state social insurance for the working classes to cover sickness, accident, invalidism and old age.

Dr. Sidney E. Goldstein, speaking on social service in hospitals, pointed out that the patients are more than "cases," and that they need friendly sympathy. The Social Side of Psychiatry was presented by Dr. August Hoch, who called special attention to the need of discovering and treating mental disorders in their early stages.

At the meeting given over to the care and relief of the poor, Anna B. Fox of the Buffalo Charity Organization Society, presented a strong plea for bringing about co-operation among charitable societies and other agencies in maintaining local registration bureaus, where confidential information may be kept concerning local dependents, delinquents and defectives. At the same session Francis H. McLean and John A. Kingsbury spoke on the dangers and difficulties of the home treatment of tuberculosis, and Mary Breed of Albany read a paper on the different methods that should be employed in the charitable treatment of widows and deserted wives. The last paper was discussed by Roy S. Wallace of Philadelphia.

The problem of widowhood was also dealt with at the session on children, when Mrs. William Einstein of New York strongly championed public pensions for widows with small children. Mrs. Einstein's paper, which aroused vigorous debate, contended that the widow may justly demand relief from the state as a civil right, for she has rendered service to the state by becoming a mother and she continues to render a social service by caring for her children. It is better to board-in children with their mothers than to board-out children with their foster mothers. Such relief, however, should be given not as charity, but, as is done in certain other countries, in the form of scholarships for the children. Frederic Almy, dissenting from this theory, claimed that pensions should be given from private funds, and urged that the relief be accompanied by a plan of treatment adjusted to the individual needs, and by friendly visiting.

Edmond J. Butler, for the committee on the care of children, made an appeal for preserving home life intact, even should this entail greater expense than would be incurred by supporting the dependent child in an institution. When a child must be removed to an institution, his surroundings should be as similar as possible to those of a normal home. Dr. Charles F. McKenna took the press severely to task for endangering the morals of children by publishing exciting and suggestive accounts of vice and crime.

Homer Folks pointed out the value of the juvenile court as a laboratory for studying juvenile delinquency.

Thursday morning was spent in considering, under the head of public health, the problems of preventing blindness and dealing scientifically and humanely with drunkenness. Dr. Winfred H. Smith, superintendent of the Department of Bellevue and Allied Hospitals, chairman of the committee, pointed out the duty of public hospitals to provide proper treatment for drunkards, and recommended the establishment of farm colonies for chronic cases. Dr. Menas S. Gregory of Bellevue read an able paper on Alcoholism as a Disease. This paper, which was discussed by Bailey B. Burritt, concluded as follows:

> The masses should be educated to the fact that inebriety is not a simple habit or depravty. It is essentially a disease—a disease of the mind; that the restricted sale of alcohol, the most deadly enemy of human mind and body, the most fruitful source of misery and poverty, is not an encroachment on personal liberty; that the so-called common drinker, although not a diseased alcoholic, nevertheless is gradually impairing his working capacity, lowering his resistance to disease and hastening the onset of premature old age.
>
> There is no disease that will so amply repay a large expenditure of money in the beginning. While the money spent in our charitable institutions for the mentally diseased, the weak-minded, the epileptic and the wayward, not to say the criminal, is well spent, yet I venture to say that if one-half were spent in the treatment of alcoholics and in preventive measures by enlightened methods, the necessity for the treatment of the insane, the epileptic, the imbecile and the criminal would be reduced to a minimum.

Samuel E. Elliott, secretary of the committee on blindness of the Russell Sage Foundation, spoke of the necessity for public education and co-operation among social workers in preventing blindness. Carolyn C. Van Blarcom showed the origin of infantile blindness in the germ of ophthalmia neonatorum, and stated that from forty to seventy-five per cent of all such cases are where the births are attended by midwives. She urged that the practice of midwives be surrounded with proper regulations to ensure cleanliness.

Resolutions were adopted by the conference calling for the appointment of three special committees—one to urge upon the governor and the Legislature the establishment of farm colonies for vagrants; one to urge that the state take over the control of county jails and penitentiaries; and another to urge appropriations for the completion of Letchworth Village and the New York State Training School for Boys.

The exhibits contained a number of interesting features and attracted the usual inspection. The Rochester State Hospital had an exhibit of special interest, as did also the Polish Survey of Buffalo. The Rochester citizens showed their accustomed hospitality, and arranged a very enjoyable reception at the Hotel Seneca on the opening evening.

The next conference will be held at Watertown, November 14-16, 1911, unless the executive committee finds it desirable to change the date. The next president is the Rev. Dr. Max Landsberg of Rochester, and the vice-presidents are Stanley Hunting of Watertown, Alexander J. McKinny of Brooklyn, and Mrs. Milo M. Acker of Hornell. Frank E. Wade of Buffalo was unable to accept another term as secretary and was succeeded by John A. Kingsbury of New York. Frank Tucker is continued as treasurer. The committees and their chairmen for the next conference are as follows: Housing, Lawrence Veiller, New York; public institutions, Rev. William J. White, Brooklyn; public health, Dr. George W. Goler, Rochester; child labor, Mrs. Florence Kelley, New York; care and relief of the poor in their homes, Anna B. Pratt, Elmira; care of children, Dr. Ludwig B. Bernstein, New York; exhibits, Richard Wallace, Albany.

PROBATION CONFERENCE AT ROCHESTER

The third annual State Conference of Probation Officers, held at Rochester on Tuesday and Wednesday of last week under the auspices of the State Probation Commission, was marked by a record attendance of a little over one hundred

persons. It was a real conference. Practically all the time was given to informal discussion in which more than half of those present participated.

President Homer Folks of the State Commission sounded in his opening remarks what proved to be the dominant note—the importance of carefully studying each case and of exercising a nicety of judgment and firmness of execution which will enable the work of the probation officers to stand the test of cold analysis. County Judge John B. M. Stephens of Monroe county, who welcomed the delegates to Rochester, emphasized that the position of probation officer is not a job, but a ministry.

The most animated discussions related to the methods of securing employment for adult probationers; the importance of using every means in cases of violation of the probationary conditions, by either children or adults, to avoid the necessity of returning delinquents to court; the value of medical and mental examinations of juvenile defendants, and the desirability of keeping the names of children brought to court from being published in the newspapers. County Probation Officer Edwin J. Cooley of Erie county, who opened the discussion of the first of these topics, provoked a division of opinion as to whether probation officers should inform prospective employers that probationers, recommended by probation officers for positions, are on probation. The consensus of opinion was that probation officers should exercise caution and discretion lest they unduly jeopardize the welfare of the probationers.

Anne V. Roome, probation officer in the Brooklyn Domestic Relations Court, and Minnie S. Fisher, a volunteer probation officer in the Syracuse Children's Court, pointed out that probation officers, as a rule, should not return probationers to court for minor violations of the probationary conditions, but first should endeavor to deal with them as effectively as possible through other means. Discussions concerning preliminary investigations and the improvement of home conditions were led by Probation Officers Frederick W. Pfeiffer of the Buffalo Children's Court, Richard A. Wallace of the Auburn Recorder's Court, and William A. Killip of the Rochester Children's Court.

Beside probation officers and representatives of probation associations, representatives of societies for the prevention of cruelty to children and of the Big Brothers Movement were present. Rufus De L. Putney, secretary of the Big Brothers Movement of New York City, told of the work of that organization. The next conference will probably be held at Watertown in November, 1911. The State Probation Commission expects to publish the proceedings of the Rochester conference.

BOSTON CIVIC ADVANCE CAMPAIGN

Not since the Chapman religious revivals of 1909 has the entire metropolitan district of Boston been addressed as it has through the Civic Advance Campaign of Boston-1915 which opened with a conference of New England mayors and city officials.

The purpose of the campaign, to enlist the services of Greater Boston in municipal advance, stands in strong contrast to the political campaign which came to a close only two days before the mayors' conference. New England, and particularly Massachusetts, had been engaged in a bitter partisan struggle which involved the tariff, reciprocity with Canada, the high cost of living and a hundred other issues that sharply marked party lines. Fresh from this political struggle, forty mayors and city officials representing every state and every political party in New England, met and discussed—not Foss nor Lodge nor the chances of another election — but the city's inspection of its milk supply and old age pensions. The delegates met in the aldermanic chamber of the City Hall under the chairmanship of Mayor Fitzgerald. Dr. Thomas F. Maloney of Fall River and Prof. William T. Sedgwick of Massachusetts Institute of Technology spoke on milk inspection, and Prof. F.

Spencer Baldwin and H. LaRue Brown discussed old age pensions.

At other sessions, Dr. Richard C. Cabot spoke on Common Colds and Preventable Illness; Edward F. McSweeney on Tuberculosis; Dr. M. G. Overlock on the Worcester Manufacturers' Movement; Dr. Charles W. Eliot on Sex Diseases; George B. Ford on The Influence of City Planning upon the City Budget; Mayor James Logan of Worcester on the Public Service Corporation and the City, and George A. McAneny, president of the Borough of Manhattan, on Giving the Taxpayer his Money's Worth.

At the final session a permanent organization of New England mayors was effected to meet annually and discuss the problems of New England city administration. Mayor Fitzgerald of Boston was elected president and representatives from each of the New England states were appointed to frame a constitution. This New England organization of mayors is the second of its kind in the United States, the first being formed last spring at Schenectady by the mayors of second class cities of New York state.

The mayors attended the first performance of the dramatic civic pageant, picturesquely christened Cave Life to City Life, which packed the Boston Arena at each of four performances.[1]

After the mayors had adjourned, the Civic Advance Campaign continued in a series of civic rallies throughout the metropolitan district. Meetings in thirty of the towns surrounding Boston, were addressed by leaders in social and civic work from Boston and other cities of the country. Among those from outside the city were: Clinton Rogers Woodruff, secretary of the National Municipal League; Henry B. F. Macfarland, ex-commissioner of the District of Columbia; Owen R. Lovejoy, secretary of the National Child Labor Committee; Paul U. Kellogg of THE SURVEY; George E. Johnson, superintendent of the Playground Association of Pittsburgh; Mrs. Florence Kelley, secretary of the National Consumers' League; Herman A. Metz, ex-comptroller of New York, and Prof. Henry C. Suzzallo of Columbia University.

There were still other meetings. The young people's religious organizations of Greater Boston discussed Opportunities for Young People's Work in Civic Righteousness with addresses by the Rev. O. P. Gifford, the Rev. Samuel McChord Crothers, Guy A. Ham and Dr. C. A. Vincent. The Oath of Loyalty taken by the young citizens of Athens was explained and administered by Judge Robert F. Raymond as follows:

> We will never bring disgrace to this, our city, by any act of dishonesty or cowardice, nor ever desert our suffering comrades in the ranks.
>
> We will fight for the ideals and sacred things of the city, both singly and together. We will revere and obey the city's laws and do our best to incite a like respect and reverence in those above us who are prone to annul them or set them at naught.
>
> We will strive unceasingly to quicken the public's sense of civic duty. Thus in all these ways we will transmit this city not only not less, but greater, better and more beautiful than it was transmitted to us.

The Central Labor Union conducted a meeting the evening of the same day at Faneuil Hall, at which Mrs. Florence Kelley, Edward A. Filene and Paul U. Kellogg spoke. The final meeting of the campaign in Tremont Temple was addressed by Governor-elect Foss, President Charles F. Thwing of Western Reserve University, Rabbi Stephen S. Wise of New York and others.

PHILADELPHIA INSTITUTIONS FOR CHILDREN

The Philadelphia institutions for dependent white children began on November 9 a series of round table discussions on problems of child-saving that promise to have far-reaching effects on the children's work of the city. Early in the fall a rough draft of what might be discussed in a series of meetings between the institutions was submitted and acted upon. Invitations were sent to some forty agencies and acceptances received from about thirty-five.

[1] In a later issue, THE SURVEY will report the Boston-1915 pageant, the largest of its kind in this country.

Three years ago it was suggested that a series of informal meetings be held to discuss better standards of work and better methods of care. The subject was again taken up last winter and it was tacitly understood that action should be deferred until this season. This offered an opportunity to study the success of a similar series of meetings conducted by the institutions for colored children. These resulted in a redivision of the field of care and a better and more interesting method of work. Their success removed the last objection to meetings among the white institutions.

In the last few years some ten institutions, including Girard College under its new president, Prof. Cheesman A. Herrick, have undergone great changes. Emphasis is placed upon the newer methods of work. The proposed discussions are expected to bring about more specialization. A large number of the institutions are now committed to careful inquiries preliminary to the acceptance of any child and to careful registration with some central agency to prevent duplication of work. With many of the institutions, as in the Jewish Foster Home, the inquiry is made by different members of the admission committee and the work is very efficiently done. Owing to the great increase in applications, however, and the feeling that a social survey of a family is the task of an expert, this institution, as well as many others, is thinking of having a trained investigator to control the acceptance and discharge of children.

Each meeting will be largely under the direction of the institution where it is held. The papers submitted will be brief, in order to give ample opportunity for discussion.

The seven fortnightly meetings, all to be held at different institutions, will be on the following subjects: History of Child Helping Agencies, Present Day Methods, Institution Organization, Physical Care of Children in Institutions, Training and Supervision, Placing Out, and a résumé of the conferences of the winter.

Protestant, Catholic, Jewish and nonsectarian institutions of all types will be represented. The bringing about of closer relations between the institutions and the placing-out societies, primarily, and of all social organizations, secondly, is looked for as one of the big results.

The following institutions and agencies will participate:

Baptist Orphanage, Bethesda Home, Burd Orphan Asylum, Church Home for Children, Friends' Home for Children, Haddock Memorial, Home for Infants, Hospital of the Good Shepherd, Howard Institution, Methodist Episcopal Orphanage, Northern Home, Odd Fellows' Home, Orphan Asylum of Philadelphia, Presbyterian Orphanage, Southern Home, Western Home for Poor Children, Catholic Home for Destitute Girls, Christ Home, Girard College, Home for Hebrew Orphans, Jewish Foster Home, Lincoln Institute, Lutheran Home, Masonic Orphanage, Orange Home, St. John's Male Orphan Asylum, St. John's Female Orphan Asylum, St. Martin's College, St. Vincent's Home, St. Vincent's Home and Hospital, St. Vincent's Orphan Asylum, Western Temporary Home, St. Joseph's Female Orphan Asylum and Gonzago Memorial, St. Joseph's House, Children's Aid Society, Seybert Institution, Children's Bureau and the Society to Protect Children from Cruelty, Home Missionary Society, Foster Home, Foulke and Long Institution, and Society for Organizing Charity.

CALENDAR OF CONFERENCES

INTERNATIONAL (NEW).

International Congress on the Judicial Settlement of International Disputes, December 15-17, 1910. Washington, D. C. Corresponding officer, Tunstall Smith, The Preston, Baltimore, Md.

International Association for Labor Legislation, September, 1912. Zurich, Switzerland. Secretary, Stephen Bauer, Basle, Switzerland.

INTERNATIONAL (PREVIOUSLY ANNOUNCED).

International Congress on Tuberculosis. September 24-30. Rome, Italy. Secretary-general, Professor Ascoli, Via Lucina, Rome, Italy.

International Prison Congress (Quinquennial). London, 1915. Secretary, F. Simon van der Aa, Groningen, Holland.

NATIONAL (NEW)

National Convention of the Methodist Federation of Social Service, November 29-December 1, 1910. Chicago, Ill. Secretary, W. M. Balch, 625 Central avenue, Dover, N. H.

American Road Builders Association, December 6-9, 1910. Indianapolis, Md. Secretary, E. L. Powers, 150 Nassau street, New York city.

American Civic Association, December 14-16, 1910. Washington, D. C. Secretary, Richard B. Watrous, Union Trust Building, Washington, D. C.

American Statistical Association, December 27-30, 1910. St Louis, Mo. Secretary, C. W. Doten, 491 Boylston street, Boston, Mass.

American Political Science Association, December 27-30, 1910. St. Louis, Mo. Secretary, W. W. Willoughby, Johns Hopkins University, Baltimore, Md.

National Civic Federation, January 12-14. New York city. Secretary, D. L. Cease, 1 Madison avenue, New York city.

Federal Council of Churches of Christ in America, January 17-19. Washington, D. C. Corresponding secretary, E. B. Sanford, D.D., 81 Bible House, New York city.

Federated Boys' Clubs, Annual Meeting February 15. Fall River, Mass. Executive secretary, Arthur B. Leach, Room 308, 35 Congress street, Boston, Mass. Annual Conference, June, Brookline, Mass.

Religious Education Association, February 14-16. Providence, R. I. Secretary, Henry F. Cope, 193 Michigan avenue, Chicago, Ill.

Convention of the Young Women's Christian Association of America, April 19-27. Indianapolis, Ind. Secretary, Lois J. Viele, 125 East Twenty-seventh street, New York city.

National Federation of Remedial Loan Associations, June. Boston, Mass. Secretary, J. T. Exnicios, 914 G street, N. W., Washington, D. C.

Conference on the Education of Dependent, Backward, Truant and Delinquent Children. June. Boston, Mass. Secretary, Elmer L. Coffeen, Westboro, Mass.

National Conference of Poor Law Officials, June 7. Boston, Mass. President, Dr. Robert W. Hill, State Board of Charities, 105 East Twenty-second street, New York city.

American Board of Commissioners for Foreign Missions, October 10-13. Milwaukee, Wis. Secretary, Cornelius H. Patten, 14 Beacon street, Boston, Mass.

National Conference of Catholic Charities, September, 1912. Washington, D. C. Secretary, William J. Kerby, D.D., Catholic University, Washington, D. C.

National (Previously Announced)

American Society of Sanitary and Moral Prophylaxis, Second Thursday in December, February, and April. New York, N. Y. Corresponding officer, James Pedersen, M.D., 29 West Forty-second street, New York city.

American Academy of Medicine, Midyear meeting, December 1-2, 1910, Buffalo, N. Y. Annual meeting, June 24-26, Los Angeles, Cal. Secretary, Charles McIntire, M.D., 52 North Fourth street, Easton, Pa. Subject of both meetings: Medical Sociology.

American Sanatorium Association, December 10, 1910. Lake Kushaqua, N. Y. Secretary, Dr. Harry Lee Barnes, Lake Wallum, N. Y.

American Civic Association, December 14-16, 1910. Washington, D. C. Secretary, Richard B. Watrous, R. 913 Union Trust Building, Washington, D. C.

American Sociological Society, December 27-31, 1910. St. Louis, Mo. Secretary, Alvan A. Tenney, Columbia University, New York city.

American Association for Labor Legislation, December 27-31, 1910. St. Louis, Mo. Secretary, John B. Andrews, Metropolitan Tower, New York city.

American Association of Home Economics, December 27-31, 1910. St. Louis, Mo. Secretary, B. R. Andrews, Teachers College, New York city.

American Economic Association, December 27-31, 1910. St. Louis, Mo. Secretary, T. N. Carver, Harvard University, Cambridge, Mass.

American Historical Association, December 27-31, 1910. Indianapolis, Ind. Secretary, W. G. Leland, 500 Bond Building, Washington, D. C.

National Child Labor Committee, March. Birmingham, Ala. Corresponding officer, Owen R. Lovejoy, 105 East Twenty-second street, New York city.

National Association for the Study and Education of Exceptional Children, March or April. New York city. Corresponding officer, Waldemar Groszmann, Plainfield, N. J.

American Federation of Arts, May. Washington, D. C. Secretary, Leila Mechlin, 1741 New York avenue, Washington, D. C.

National Conference of Charities and Correction, June 7-14. Boston, Mass. Secretary, Alexander Johnston, Ft. Wayne, Ind.

National Probation Officers' Association, June 5-14. Boston, Mass. Secretary, Roger N. Baldwin, 903 Security Building, St. Louis, Mo.

National Women's Trade Union League, June. Boston, Mass. Corresponding officer, Mrs. D. W. Kefler, 5,273 McPherson avenue, St. Louis, Mo.

American Medical Association, June 27. Los Angeles, Cal. Secretary, George H. Simmons, M.D., 535 Dearborn avenue, Chicago, Ill.

National Education Association of the United States, July. San Francisco, Cal. Secretary, Irwin Shepard, Winona, Minn.

National Fraternal Congress, August 21. Mackinac Island, Mich. Secretary, C. A. Gower, Lansing, Mich.

American Hospital Association, September 19-22. New York city. Secretary, J. N. E. Brown, M.D., Toronto General Hospital, Can.

American Prison Association, September. Omaha, Neb. Secretary, Joseph P. Byers, 13 Central avenue, Newark, N. J.

State (New)

Southern Education Conference on Religion and Morals in Public Schools, December 28, 1910. Chattanooga, Tenn. Secretary, Henry F. Cope, 193 Michigan avenue, Chicago, Ill.

Colorado State Association for the Prevention and Control of Tuberculosis. January 15. Denver, Colo. Secretary, S. Poulterer Morris, Room 29, State House, Denver, Colo.

Alabama Conference of Charities and Correction, March. Birmingham, Ala. Secretary, Maurice Willows, Birmingham, Ala.

Connecticut Conference of Charities and Correction. March or April. New Haven, Conn. Secretary, Charles P. Kellogg, Waterbury, Conn.

Sagamore Sociological Conference, June 27-29. Sagamore Beach, Mass. President, George W. Coleman, 348 Congress street, Boston, Mass.

Stony Brook Assembly, August. Stony Brook, L. I. Director, J. W. Jenks, Cornell University, Ithaca, N. Y.

Ohio Conference of Charities and Correction, November. Toledo, Ohio. Secretary, H. H. Shirer, 805 Harrison Building, 21 S. High street, Columbus, Ohio.

State (Previously Announced)

Iowa Conference of Charities and Correction, December 4-7, 1910. Des Moines, Ia. Secretary, George Mogridge, M.D., Institute for Feeble-Minded Children, Glenwood, Ia.

South Carolina Conference of Charities and Correction, December 8-19, 1910. Florence, S. C. President, A. T. Jamison, Connie Maxwell Orphanage, Greenwood, S. C.

Michigan Association for the Prevention and Relief of Tuberculosis, December 9, 1910. Ann Arbor, Mich. Secretary, A. S. Warthin, Ann Arbor, Mich.

Virginia Anti-Tuberculosis Association, December 15-16, 1910. Richmond, Va. Executive secretary, Douglas S. Freeman, M.D., Richmond, Va.

New York Child Welfare Exhibit, January 18-February 12. New York city. Secretary, Roy Smith Wallace. Room 5,105 Metropolitan Building, New York city.

New Jersey Conference of Charities and Correction, April. Princeton, N. J. Secretary, J. Byron Deacon, Room 417 Roger Williams Building, Philadelphia, Pa.

Arizona Association for the Study and Prevention of Tuberculosis, May. Bisbee, Ariz. Secretary, John W. Flinn, Prescott, Ariz.

Canadian Conference of Charities and Correction, May 8-12. Hamilton, Ont. Secretary, F. M. Nicholson, Parliament Buildings, Toronto, Ont.

New England Conference on Street Cleaning, June. Springfield, Mass. Corresponding officer, Carol Aronovici, 55 Eddy street, Providence, R. I.

Northern Baptist Convention, June 13. Philadelphia, Pa. President, Emory W. Hunt, Denison University, Granville, O.

Pennsylvania Association of Directors of the Poor and Charities, October 10-12. Indiana, Pa. Secretary, L. C. Colborn, Somerset, Pa.

GENTLEMAN desires position in this city with some association engaged in philanthropic work or social betterment. Business experience. Also has devoted years to friendly visiting, charitable aid and similar activities. Address

WORKER, Survey Office, 105 East 22d Street

EXPERT, verbatim reporting of conventions and public addresses — New York or other cities—highest references as to previous work.

THE COMMON WELFARE

ONCE AGAIN SHOP EARLY!

With this first December issue THE SURVEY reminds its readers for the fifth time, in what is now a familiar phrase: "Shop early. That will be your best Christmas present—to the girls behind the counters and boys on the delivery carts."

It may almost be assumed that no reader of THE SURVEY now buys presents after December 15. The campaign begun by the New York City Consumers' League, and conducted over the entire country by the National Consumers' League and Charities Publication Committee, has caught on wonderfully. When the notice was sent out last year it was found that merchants had already begun to use the shop-early card in their advertisements, some newspapers had printed early reminders and hundreds of others stood ready to give generously of their space to THE SURVEY's articles and cartoons. There is in the very spirit of Christmas a prompting to help in so good a cause. Grateful acknowledgment is here made to thousands of merchants and hundreds of editors who have borne a hand. They are offered this year as special features a story of a shop girl, contributed by James Oppenheim, author of Dr. Rast and Wild Oats, and a series of cartoons, some of which are reproduced in this issue.

Beyond the humane motive—the Christmas spirit manifested so directly in the easing of heavy burdens—evidence accumulates of a growing appreciation of the personal advantages of early shopping. There is good, hard common sense in buying from full stocks before the best goods have been snapped up by the early birds, and there is great gain in personal comfort in avoiding the rush.

Literally millions of people have seen the articles, the cartoons and the advertisements but, with the best intention in the world, buy their presents late. Readers of THE SURVEY can help not only by good example, but by the timely hint, in the words of a prime advertiser, that "this means you." There is a good suggestion in the practice of a busy New York office which gives each of its employes a shopping half holiday *in the morning* between December 1 and December 15. The Brooklyn tuberculosis committee has donated to the campaign the temporary use of the back of the street car transfers for announcements. The New York Consumers' League has strung across a main shopping street a huge shop-early banner, such as is used in political campaigns. Other ways of reaching shoppers will suggest themselves—and THE SURVEY will be glad to hear of them, whether tried or untried—but none is more effective than the word in time. The word is early and the time is now.

JUVENILE COURT IS OUT OF JAIL

Early in September the people in Pittsburgh interested in the Juvenile Court accomplished a significant change in the machinery for handling the boys and girls of Allegheny county who come before the law. By action of the county authorities, the detention rooms of the court have been removed from the county jail to a small separate building in the immediate neighborhood. The basement and first floor are used for purposes of detention. The Juvenile Court room, formerly also in the county jail, is in the building used as a detention home. In the basement are lavatories, a bath room and a room for preparing meals. Hitherto meals have been sent to the detention home from the county jail, but it is proposed later to discontinue this arrangement and prepare meals in the home itself.

The administration of the detention rooms, formerly under the warden of the jail, is now transferred to the superintendent of county buildings and a superintendent is in charge of the detention rooms.

Probation officers, leaders in the Juvenile Court Association, the Civic Club of Allegheny County, the Associated Charities, and others, have long urged that however capable the jail administration might be—and Warden Lewis is a man of high standards—the barred doors, bridge of sighs and high stone walls of the county lock-up were no place for juvenile delinquents. The unsuccessful effort of the county commissioners to purchase adjoining school property on which to erect additional buildings has been a factor in the delay. The old structures now thrown into commission are by no means a permanent solution of the problem. What is needed is a modern and especially equipped home for the juvenile court, or at least for its wards. But the present change is felt to be a big step forward, and directly in the spirit of modern juvenile court administration.

O'Loughlin in Salt Lake City *Telegram.*

TEN-HOUR LAW FOR ALL WOMEN

A movement to widen the application of the Illinois ten-hour law governing women's work has been started by the Women's Trade Union League. The law, which went into effect July 1, 1909, and was held constitutional by the Supreme Court of Illinois on April 21, 1910, after arguments by Louis D. Brandeis and other distinguished public lawyers,[1] applies only to women working in factories, laundries or mechanical establishments. At the time of the legislative struggle for this "girls' bill"[2] there was discussion as to whether department stores and other establishments should be included, and those who opposed the bill because it affected the industries in which they were employers made much of the point that the law would be unfair unless it applied to all work by women. This contention was, perhaps, made in the hope that if a broader law were urged the combination of business interests affected would be strong enough to defeat the whole bill—and for this reason the Women's Trade Union League framed the bill so as to include only factories, laundries and mechanical establishments. If the foregoing argument was made in good faith by the opponents of the bill, they now have an opportunity to assist the Women's Trade Union League in making the law extend "fairly" to other lines of work in which women are employed, for if the amendment proposed is enacted at the next session of the Legislature the law will read:

> That no female shall be employed in any manufacturing, mercantile or mechanical establishment, laundry, hotel or restaurant, telegraph or telephone establishment, express or transportation company, or as park attendant, more than ten hours in any one day or more than fifty-four hours in any one week.

In proposing this amendment, the league has asked the co-operation of the following bodies:

Illinois State Federation of Labor, National Council of Women, American Association for Labor Legislation, Consumers' League, Federation of Young Women's Clubs, Socialist Women's Organization, Illinois State Suffrage Association, Illinois State Federation of Women's Clubs, Young Women's Christian Association, Women's Colleges of Illinois, Federation of Settlements.

A legislative committee has

Walker in Rockford *Republican.*

[1] See THE SURVEY for April 2, 1910.

[2] See THE SURVEY for July 3, 1909.

been formed with seven members, five from Chicago and two from Springfield, where a branch of the National Women's Trade Union League is strategically located to help in bringing pressure to bear upon the Legislature.

The campaign for the amendment is being vigorously pushed throughout the state, and many meetings are to be held. The State Federation of Labor at its recent meeting in Rock Island voted to give its full support. A poster has been printed showing by roll call just how each member of the last Legislature stood on the women's ten-hour bill.

The poster was used effectively in November against the re-election of members of the last Legislature who opposed the ten-hour bill. As a result of this opposition by the league in co-operation with other civic bodies, a number of candidates were defeated on their record. Moreover, every legislative candidate was specifically asked whether he would favor the proposed amendment, and affirmative replies were received from most of the candidates who were elected on November 8, so that there is promise of success for the bill in the next session.

SIX-DAY WORK IN STATE LAWS

In the September *Bulletin of the New York State Department of Labor* John A. Fitch considers legislation throughout the United States for the prevention of seven-day labor. Forty-five states, Alaska, Hawaii and Porto Rico have laws forbidding Sunday labor, and with the single exception of the California Supreme Court (*ex parte* Newman, 9 Calif., 502, 1858, ground of religious discrimination), wherever cases under these laws have come up they have been declared constitutional by both state and federal courts.

Up to 1844 the grounds for these court decisions were religious; between 1844 and 1864 the point of view was gradually changing from "other-worldliness" to "this worldliness"—the protection of the health of the laborer by allowing him a reasonable amount of leisure—and since 1866 the ground taken has been exclusively the police power of the state to protect health.

In spite of this legislation Sunday labor exists practically throughout the Union in blast furnaces, iron and steel works, telegraph and telephone lines, heat, light and power plants, newspapers, hotels and restaurants and on railroads and street railways. In certain localities ten other industries are carried on during seven days in the week. In 1907 the Massachusetts Legislature reported 221,989 men employed on Sundays in that state. The reasons are not far to seek. In the first place, the religious origin of Sunday laws has made them in practically every state a part of the penal law, and the Department of Labor, which alone is concerned with the protection of the health of workers, has no power to enforce them. In the second place, there is this fundamental objection to all Sunday laws, that it is impracticable under modern conditions for certain industries to shut down entirely on one day in the week. In some cases, like the railroads, public necessity; in

Harding in Brooklyn *Eagle*.

others, like blast furnaces, technical peculiarities which would cause great waste; in others, like canneries, the seasonal character of the work and dependence on the weather; and in still others emergencies demand seven-day labor. In order to meet these necessities of modern industry, practically every state has made exceptions to the Sunday law so broad in scope as "to protect all continuous industries against enforced inactivity one day in the week, and to afford no protection to the workmen against enforced activity seven days in the week."

Asheville *Citizen*.

The Sunday laws, then, have failed of both their religious and their hygienic purpose and some other and more practicable law must take their place. Such a law exists in the rest-day legislation of Massachusetts and California. The Massachusetts law provides that, except in emergencies or at the request of the employe or in the case of farm or personal servants, druggists, watchmen, superintendents or managers, janitors or persons engaged in the transportation, sale or delivery of milk, food or newspapers, no employe can be required to work on Sunday unless he is allowed twenty-four consecutive hours without labor during the other six days in the week. The California law is more sweeping than the Massachusetts statute, covering all work except that necessitated by emergencies. Furthermore, it avoids the charge of religious discrimination—the ground of the adverse decision of the California Supreme Court referred to above—by requiring simply that every employe shall be given twenty-four consecutive hours' rest after six days' labor.

The principle of such rest-day legislation is thus outlined by Mr. Fitch:

> While it may be necessary for an industry to operate continuously, every day in the week, it is not therefore necessary for workmen to labor every day in the week. Accordingly, it may be required that those industries which have to be in operation on Sunday, shall allow every employe at work on that day a full day of rest on some other day. Under such a law, either the industry will have to stop one day a week or else the working force will have to be increased one-seventh and the employes receive their rest period on different days by rotation through the week; that is, one group of employes would have Sunday as a rest day, another Monday, and so on through the week. Thus the full quota of workmen would always be employed and the industry would not suffer, but every man would have a day of rest. Such a law protects both the industry and the workmen, and it naturally tends to protect the Sabbath much more than the laws now in existence. It penalizes continuous operation by requiring the addition of one seventh to the working force and hence to the pay-roll. Accordingly, the seven-day industries that are not necessarily continuous would tend to go back to a six-day schedule, and the day of rest would naturally be Sunday.

Two states have passed laws based on this principle; two others require rest periods in certain industries. Practically all Sunday decisions for the last forty years have been based on the police power of the state, a principle which in all states would apply equally well to rest-day legislation.

The *Bulletin* contains the full text of legal decisions and Sunday and rest-day laws throughout the United States.

FORTY VOLUMES ON IMMIGRATION

On December 4, the Federal Immigration Commission, created by the act of February 20, 1907, goes out of existence.

During the past fortnight, the commission has been holding sessions in Washington drafting its recommendations which, together with a summary volume of its findings, will be presented at the opening of Congress in December. This initial instalment will be the precursor of no less than forty volumes, some of which are already in press, which will be issued from the government printing office in the next six months. They will make up the most extensive series of governmental reports on social and economic topics (the United States Census excepted) since the Federal Industrial Commission of 1900.

At the outset of its work, the commission faced two possible lines of activity, —one, that of bringing existing data together in a new form; and the second, while utilizing existing data, to invest its energies and funds in original inquiries. The second plan was adopted and, after the first month all the lines of investigation were co-ordinated under the central office in Washington. The field work was practically concluded on July 1, 1909, and the compilation of data and preparation of reports have employed a large office force for the greater part of the past two years. The January magazine number of THE SURVEY will largely be given over to an interpretation of this work and a presentation of the gist of the findings, by some of those who have been most closely identified with it. The extent of the undertaking is indicated by the fact that the expenditures will reach over $700,000 and the data represent original information secured for more than 3,000,000 individuals. What is, perhaps, of even more far-reaching significance is that by an amendment to the census bill of 1910 the traditional method of recording the population of the United States by country or place of birth, which has been in force since 1850, has been modified so as to provide for the enumeration of the foreign-born according to their "nationality or mother tongue." This was in line with the departure of the Bureau of Immigration in 1899, which since then has gathered statistics by race as well as by the country of last permanent residence.

The Immigration Committee adopted practically the same classification of races or peoples as the administrative bureau, and therefore these three sources of governmental statistics will be comparable: the Immigration Commission's report will itself be a setting for the even more inclusive data gathered by the census enumerators the past year,

Besides the summary volume already referred to, the immigration report will include volumes interpreting conditions in the countries from which people emigrate, the history of earlier European immigration, a statistical history of immigration from 1820 on, the distribution of immigrants from 1850 to 1900, the immigration situation in other countries which occupy somewhat the same position toward Europe as the United States (Canada, Australia, New Zealand, Argentina, Brazil), the occupations of immigrants, the fecundity of their women, and, a unique feature and one likely to prove of service throughout the United States, a dictionary of races or peoples. Another special volume, a digest of which, together with several of the other special reports, was presented to Congress at its last session, is a treatise on the changes in the bodily form of decendants of immigrants. This is the work of Prof. Franz Boas and analyzes such indications as can be scientifically determined as to the fundamental effect of the merging and mingling of varied ethnic stocks in this new country.

Other volumes will deal with steerage conditions, immigrant homes and aid societies, the importation of women for immoral purposes, contract labor, the *padrone* system, immigrant banks, peonage. These will cover, therefore, not merely special institutions and phenomena which have grown up with the incoming of strangers, but their relation to existing social institutions, and to charity, crime, insanity and public relief.

Two volumes each will be given up to the discussion of immigrants in the Pacific coast and Rocky mountain states, immigrants in cities, immigrants in agriculture, and the children of immigrants in schools; a full dozen volumes will deal with immigrants in the industries. These include bituminous coal mining, iron and

steel, cotton goods manufacturing in the North Atlantic states, woolen and worsted goods, silk and dyeing, clothing, collar, cuff and shirt manufacturing, leather, boot and shoe manufacturing, gloves, slaughtering and meat packing, sugar refining, glass, agricultural implements and vehicles, cigars and tobacco, furniture, copper, mining and smelting, iron ore mining, anthracite coal mining, oil refining and diversified industries; concluding with a section on the floating immigrant labor supply.

TOLSTOI AND IMMIGRATION

How the world touches hands is illustrated in this number of THE SURVEY. The cover presents a portrait of Leo Tolstoi in peasant's blouse and, while the articles were not gathered with such an end in view, several of them bear a striking relationship to the life of the great Russian who died the past month. The exception is the essay on Tolstoi's Resurrection by E. A. Goldenweiser of Kiev, a leader of the Russian bar, who was an unofficial delegate to the recent International Prison Congress in Washington, and to whose mind this novel transcends mere criticism of the Siberian penal system and ranks with Mrs. Stowe's Uncle Tom's Cabin; to him it is a universal protest against a social institution which has outlived its usefulness—namely, our present system of criminal trial and punishment. Graham Taylor reviews Miss Addams's Twenty Years at Hull House, the tribute of one great settlement leader of Chicago to another. It will be remembered that Tolstoi gave the proceeds from The Resurrection to the Doukhobors, the Russian peasant sect which adopted his doctrines, to enable them to make their pilgrimage to northern Canada, perhaps the most picturesque feature of the immigration movement to this country in our generation. The balance left over from this fund was contributed to Hull House as the first neighborhood center to interpret the conditions and aspirations of the foreign colonies which have grown up in our American cities. The Boston pageant in November, From Cave Life to City Life, brought out in picturesque cast not only the evolution, but the polyglot character, of our urban centers. Announcement is made in another column of the forty volumes in which will be embodied the findings of the Federal Immigration Commission and the leading article of this issue is an interpretation of the Westmoreland strike, which has been going on for six months in western Pennsylvania, practically unheard of so far as the outside world is concerned, but in reality a widespread Slavic insurrection in the bituminous coal fields.

THREE RADICALS GO TO CONGRESS

From the standpoint of social theory, the three most interesting figures in the new Congress elected in November are Victor Berger of Wisconsin, Henry George, Jr., of New York and William Kent of California. Three sketches outlining what these men stand for by men thoroughly in sympathy with the men and their measures are presented in the following columns. The writers of the sketches are no less interesting than the men described. John Spargo, author of Socialism, Karl Marx and many other writings interpretive of socialist theory to Americans, writes of Victor Berger. Mr. Spargo worked as a lad in the coal mines of England and brought with him to this country in the nineties, as one of his most prized possessions, a series of resolutions signed by Keir Hardy and other members of the English laborite group with whom he had worked shoulder to shoulder in the days before their parliamentary successes. His best known practical work in this country was the institution of the People's Forum at Yonkers, a platform for popular discussion used by the working people of this large industrial suburb of New York. Henry George, Jr., also has been an active campaigner in the English elections as well as in American politics. His work is described by Louis Post, editor of the *Public* of Chicago, the trenchant exponent of the single tax movement in this country. William Kent, less than ten years ago an independent alderman fighting corruption and franchise graft in the Chi-

cago City Councils, and perhaps better known as the donor of the Muir Woods to the United States government, ran this fall on what was distinctly a conservation platform as a republican insurgent in California. He is appraised by Ben B. Lindsey, the democratic judge of Denver, who has made the American Juvenile Court a national institution, and whose book, The Beast, has been the most daring exposure we have had in this country of bi-partisan corporation control in municipal government.

A HENRY GEORGE IN CONGRESS

LOUIS F. POST
Editor of the Public

Henry George, Jr., is "the son of his father" in every sense but one. He is not dependent upon his father's name for his own career.

His father's ideals, however, and his father's life work, are his own ideals and the work of his own life. Not as a servile imitator, but as one of those men in all parts of the world who have seen the star his father saw, he has carved a career for himself as a world leader in spreading the gospel of liberty and brotherhood, industrial as well as political. His object, as it was his father's and is that of all his father's following, is to abolish the exploitation of labor; and to this end his energies are concentrated upon the abolition of privilege.

There is no lack of constructive work in his career. Some of it he did as his father's associate; but most of it, except part of the work of personal preparation, he has done independently. Should any of it seem non-constructive to the unthinking, let them take note that "the erection of a tower begins, constructively, not with building up, but with clearing away and digging down."

It must also be noted that fussy work is not necessarily constructive. Neither is mere work though not fussy and though good in itself. To care for the victims of dangerous sidewalks is good work in itself, but the true constructive work would be work that leads to the making of new and safe sidewalks, so that there may be no more victims. This is the kind of work to which Henry George, Jr., is especially devoted.

He is the author of a book, The Menace of Privilege, which impressively describes the development of privilege in our democratic country and the cumulative wreckage it strews along its devastating pathway. This exposure of privilege he has followed with a romance, John Bainbridge, in which American life is pictured in the setting of economic privilege and labor exploitation. Meanwhile, as newspaper worker, from reporter to managing editor, as a contributor to the newspapers and magazines of Great Britain as well as here, and in lectures and speeches in the United States, England and Scotland, Ireland, Japan and Germany, he has contributed his share to the breaking down of those barriers of legal privilege that hold workers within economic corrals where the privileged may exploit them easier than heartless herdsmen brand cattle or gentle shepherds shear sheep.

But make no mistake, dreamy enthusiast or robust doer of things to do! The new congressman from the seventeenth New York district is no "dreamer of dreams" except as the great Joseph was. If he dreams of an ideal, his common sense tells him how to get it. He knows that you cannot abolish the exploitation of labor with any magic "presto," nor dissipate privilege with zephyrs. He knows that idealistic conception, though this come first in the order of development, must be realized by practical construction; and that construction consists less in drawing picturesque front elevations than in the commonplace and laborious work, sometimes as iconoclastic as tearing away obstructive "shacks," of monotonously doing one blessed thing after another.

That is what one might call Henry George's congressional platform if one had the right to speak for him. To abolish the exploitation of labor, privilege must be abolished. Every part of privilege abolished is thus far toward its total destruction. Customs tariffs

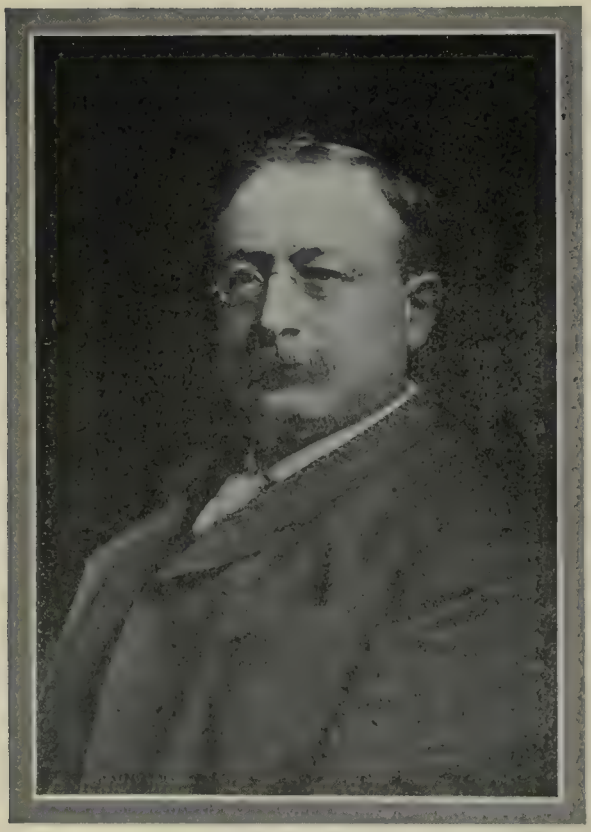
are our bulwarks of privilege, nationally. Consequently, every bit of congressional legislation destructive to the tariff wall is a deadly blow at the privileged, and therefore a champion's shot for the workers.

So might one expect Henry George, Jr., in Congress, to cooperate his own powers with the powers of the largest numbers moving in his general direction, for securing the highest degree of free trade presently possible. And in addition to congressional issues rising out of the tariff question, one might expect him to be aligned with the congressional forces that support the Pinchot movement for conservation of natural resources; for in the privileges which that movement assails, the very heart's core of all privilege lurks.

What particular policies Congressman George will adopt or adhere to, no one can say but himself. Even he may hardly know in advance of the emergencies that throw them up to the surface of congressional controversy. But the congressman who hold's this man's convictions and has his common sense and courage, can be trusted to decide upon official details from time to time as they arise to challenge official attention.

HENRY GEORGE, Jr.
Congressman-elect from New York. A leading exponent of the single-tax, here and abroad.

THE FIRST SOCIALIST CONGRESSMAN



JOHN SPARGO
Author Karl Marx, His Life and Work[1]

For the first time in the history of the nation a socialist has been elected to Congress. Not a near-socialist, mind you, nor a socialist who avoided the name, nor one who uses a compound title in which the word "socialist" is qualified and modified.

No, Victor Berger, the man elected, is a real socialist. He wears the red flag as an emblem of his faith and his party. He is a member of the national executive committee of the Socialist Party, and was one of its eight elected delegates to the International Socialist Congress at Copenhagen recently. In short, he is a thoroughly representative socialist. When he takes his seat in Congress he will be the representative of the actual socialist movement.

So there will be a third party in Congress, a tiny minority of one, with one vote in a total of 392. It will not be an insignificant minority, however, but one to be reckoned with. Those disposed to sneer at this minority party of one may be reminded of the old fable: "Only one", sneered the mouse at the lioness fondly licking her cub. "Yes, only one, but that one a lion," answered the mother. The socialists will have only one representative in Congress—but that one will be Victor Berger, a lion.

[1]Karl Marx, His Life and Work. By John Spargo. B. W. Huebsch. New York. 1910. Pages 359. Price $2.50; by mail of THE SURVEY, $2.70.

VICTOR BERGER.
Congressman-elect from Wisconsin. The first socialist to be elected a member of the national legislature of the United States.

For Victor L. Berger is a big man from every point of view. He is big physically; he is big intellectually, and he is big spiritually. In any assembly of men of acknowledged greatness he would command attention and respect.

Berger is fifty. His hair is gray and thinner than it was, but that is the only sign of departed youth about him. His healthy, pink cheeks, his eyes radiant with gladness, and the quick, eager movement of his body bear witness to the youthfulness of his spirit. The boy still lives in the man.

Yet for more than half his life Berger has borne heavy burdens which would have crushed most men. For almost thirty years he has been fighting against terrible odds, often alone and unaided. For the sake of his ideals he has endured a life of martyrdom. Last April, when the socialists made such a "clean sweep" in the Milwaukee municipal elections, he said to me: "For twenty-six years I have seen this victory before my eyes. It has been my goal, the object of my life. Now, my life must justify the trust reposed in us."

It was characteristic of the man, that quick transition from the purely personal to the collective concept of the great victory. Berger's personality is said to dominate the socialist movement in Wisconsin, but that is only true because he sinks his personality in the movement—was it not written of old that "he who loses his life shall find it"?

Berger has lived in Milwaukee for thirty-two years, ever since he came to this country with his parents. Born in a German province of Austria, and educated in the best schools of his native land, he became a teacher of German in the Milwaukee public schools, an occupation which he followed for years, until his radical ideas led him to the difficult and thorny paths of socialist journalism.

When you meet Berger for the first time you soon discover that he worships his wife. Those of us who know him intimately know how idyllic is the life he lives in his modest home with his wife and children, and we marvel that through all the years his passion for the socialist movement and his passion for his wife have not interfered with each other. Perhaps it is because Mrs. Berger, who was his pupil, then became herself a teacher, and is now a member of the Milwaukee School Board, has long been quite as good a socialist as her husband. Be that how it may, despite the fact that during many years Berger has been bitterly assailed and vilified, no word of reproach has been brought against his personal life.

Always a close student, especially of history and economics, Berger is not only one of the best scholars in the American

socialist movement, but it is safe to say that in the next Congress there will be few, if any, better educated men than he. He is by no means a "boss" of the vulgar type, as his enemies often assert. On the contrary, he is one of the great intellectual leaders of the socialist movement.

He is no doctrinaire, however. He has thoroughly learned the terminology of socialist literature—and wisely discarded it. He cares for theories only in so far as they relate to life and help in the solution of its problems. He never addresses working men upon such themes as the Marxian theory of value, or the materialistic conception of history, though no man could do it better. "Dear madam, how will you pay the butcher's bill?" or "Brother, why should you live in a hovel?"—such themes as these inspire his trenchant pen. He is not an orator. His pen is his weapon. Few journalists in America command a better, more effective style. When he speaks his German accent is apt to obscure the fact that his English is singularly pure, but when he writes there is no accent, and his terse, crisp sentences bear witness to his perfect mastery of the language. His style is direct, simple and powerful, like Bunyan's.

In Congress Victor Berger's influence will be felt. As in Milwaukee, it will always be cast on the side of decency and progress. He knows that the social millennium will never be brought about by one supreme stroke, even if the Socialist Party should so far progress as to send three hundred other representatives to join him. He will voice the great social challenge of the age with wisdom and courage — for he is a consummate politician.

When news of his election reached me I telegraphed him that I regarded the event as being as important as the first election of Lincoln to the presidency. I believe that history will confirm that message.

A CONSERVATION CONGRESSMAN

BEN B. LINDSEY
Judge of the Denver Juvenile Court

With each new election, it is becoming clearer that the great political struggle in

By the courtesy of the American Magazine.

WILLIAM KENT.

The insurgent-conservationist-congressman-elect from California, who gave the Muir woods to the nation.

this country is not so much between the parties as within the parties; between certain great interests seeking privilege through the use and manipulation of both parties on the one hand, and on the other, clear visioned, earnest men in each party in behalf of the people firmly resisting their encroachments.

This struggle has long been acute in California. There, the chief use made of the Republican Party has been as an asset to the business interests of the Southern Pacific Railroad. To rescue it from such uses a strong insurgent movement within that party began to take shape several years ago. It culminated in a magnificent victory at the primary elections which preceded the recent regular elections, when under the leadership of men like William Kent, Hiram Johnson and Francis J. Heney, the Southern Pacific crowd were routed as never before in the political history of the state.

An important part of this great struggle, to which the victory was in a large measure due, was the great race for Congress made by William Kent in the Sacramento district, so long represented by Congressman McKinlay—a reactionary and disciple of the Payne-Aldrich-

Canon régime. McKinlay, despite his stand-pat record, is an able and brilliant man, a skilled politician with all the great power of the interests in an "interest" state back of him. He was no mean adversary even for William Kent. But after a terrific primary election campaign, in which men like Gifford Pinchot traveled all the way to California to take part, and which was only equalled in intensity and interest by the fight for the nomination for governor of the insurgent Hiram Johnson, Kent won out—as he is in the habit of doing. A desperate effort was made to get progressive democrats like Senator Gore and others to go to the rescue of Kent's stand-pat democratic opponent, but the efforts failed, for such progressive democrats are likely to be, as they ought to be, more interested in the success of a progressive republican than of a reactionary democrat and it would be a very sordid partisanship that would seek to make party capital out of enmities which an insurgent republican is sure to make in his party ranks when he puts up his fight right there to wrest them from the strangle hold of the privilege grabbers.

The very embodiment of those qualities necessary to the effective reformer—sincerity, enthusiasm, courage, honesty, perseverance and common sense—it is not strange that Kent should be endowed with a passion for service. His career, all too modest, has yet been an inspiration to others in more than one city. I recall years ago a very well to do young business man of Denver, who entered enthusiastically into the work of a Municipal Voters' League for our city, after he had returned from Chicago fairly inoculated with Kent's ideas. For Kent's first important work was done in Chicago. There it was he went shortly after his graduation from Yale in 1887 to enter enthusiastically into the fight to redeem the great city from the grip of graft. There it was he learned from first hand experience, from going down in the midst of politics learning, knowing, understanding a political gang—as in a children's court we would understand the boys' gang—that our greatest governmental problem is one that should not concern political parties at all—but does—is, as he puts it, the problem of governing our cities honestly and in the interest of all their law-abiding citizens."

His deeds, and philanthropies, perhaps even more than his words, have given eloquent expression to the truth he preached about the city.

"It is," he has written, "only for a short period that we have seen what the city means. We now know it to be the highest social expression. We now know of the incalculable wealth produced by the labor saving device of propinquity, and are vaguely conscious that the community should retain what the community has created."

Is it only to be expected that a vision which sees clearly "that the community should retain what the community has created," is sure to sympathize with the national appeal for the conservation of our national resources. And in the solution of such problems as those growing out of the great issue of property rights *vs.* human rights there need be no anxiety as to where Congressman Kent will stand. It is impossible to imagine him the kind of a republican who would be bound by a caucus rather than by his conscience. It is men like Kent who can and, I believe, will, more than likely succeed in making the Republican Party so insurgent and progressive that it will in time become the live active radical party, which with the prestige of its name may become in the shortest time the most effective weapon in the hands of the people for the welding of their will into law. There are grave signs—unless there shall be a change—that the Democratic Party may become the conservative party of the country; and if so the hope of the young men of the nation especially, who want to help do things, will be best expressed in the leadership of men like this new California congressman.

Kent's first offense to the powers of privilege dated from the time he quietly determined to run for alderman in Chicago in order more effectively to fight the "gray wolves" as certain local aldermen were then called. He was one of the founders and afterward the presi-

dent, of the Municipal Voters' League. This organization did not content itself with polite generalities about civic honesty, but prodded up the real crooks and "bawled them out" by name, and with his aldermanic admission to what was then more or less a den of thieves, we had the beginning of a record that was at once as refreshing and result producing as it was admirable and (at that period) unusual.

That Mr. Kent was a young man of independent fortune has made his case all the more refreshing. Neither is a man so situated—giving freely of his time and labor—likely to be spared deeped drafts on his pocketbook than he has any right to make or the public to expect. To such philanthropies as the Hull House playground in Chicago Mr. Kent had added the great 300 acre park of noble redwood forest, but even Muir woods, however valuable, does not begin to compare with his contribution of the man himself. There is no estimating in material things the value of a real man to the state.

EDWIN R. A. SELIGMAN.
Whose quarter-century as scholar, teacher and citizen was observed in New York the past month.

A NOTABLE CIVIC DEMONSTRATION

HENRY R. SEAGER
Columbia University

Dinners in honor of distinguished citizens are sufficiently common in New York. As a rule they signalize some notable achievement, like the discovery of the North Pole, or the close of a long life of devotion to a special object. The dinner given to Prof. Edwin R. A. Seligman at the Hotel Astor on November 12 was unique because it was not occasioned by any single achievement on his part and because he is still in the prime of life. It was to commemorate the completion of his first twenty-five years of public service as scholar, teacher and citizen. Started as an expression of the honor and affection in which he is held by his colleagues and students at Columbia, the celebration grew, almost of its own momentum, until it assumed the dimensions of a veritable civic demonstration. The invitations were sent out in the name of a distinguished committee. Nearly 250 acceptances were received and when the evening arrived quite two hundred persons, representing, besides his colleagues and students, economists from other universities, federal and state officials and leading citizens of New York came together to do Professor Seligman honor.

The speakers for the occasion were carefully chosen to illustrate the wide range of interests which for him have characterized these busy twenty-five years. R. Fulton Cutting, associated with the guest of honor in the Bureau of Municipal Research, acted as toastmaster.

President Butler spoke for the university and portrayed in happy phrases the blending of scholarship and social service which is the Columbia ideal and which Professor Seligman so well represents. Dean Burgess, with real emotion, claimed Seligman as his personal discovery and described in a most interesting way their joint labors in bringing the School of Political Science to its present high standard. President James of the University of Illinois and Professor Dewey of the Massachusetts Institute of Technology characterized Seligman's work as an economist and as one of the charter members of the American Economic Association. Dr. Adler spoke for the Ethical Culture Society, of which Professor Seligman is president, and emphasized the value of his economic speculations in giving greater precision to ethical concepts and ideals. As a representative of the city government, President McAneny of Manhattan borough, after acknowledging the city's debt to the guest of honor, drew an inspiring picture of the New York of the future. Professor Emery, chairman of the Tariff Board, recalled some amusing incidents of the period when he was a student of economics at Columbia, and Gaylord White indicated what the social settlement movement in New York has owed to this university man's sympathetic appreciation of its aims and difficulties. Finally, Professor Ripley of Harvard, "the oldest living graduate," added his tribute of gratitude and appreciation to Professor Seligman, the teacher, and concluded the list of addresses by presenting him with the medal designed for the occasion by Mowbray Clark. Notable as were these addresses, Professor Seligman's reply was easily the event of the evening. With characteristic modesty he turned attention from himself to the conditions that had made his work possible. His summing up of the debt that the scholar owes to his co-workers, the teacher to his pupils, and the citizen to his fellows will long linger in the memory of those who heard him. Altogether this spontaneous tribute to an unusual career was eloquent of the increasing appreciation with which disinterested social service is coming to be regarded.

STAGE CHILDREN

JANE ADDAMS

In the recent discussion concerning the appearance of children upon the stage, there has evidently arisen a confusion between the educational value of dramatic training and stage life as a money-earning occupation for children. As Francis Wilson in a recent article has quoted the appearance of children in the Hull House Theater in such wise as to increase this confusion, the following statement may be of value.

For many years at Hull House children have given plays varying from Alice in Wonderland and Puss in Boots by the little children, to the heroic plays of Wat Tyler and William Tell given by the older lads. Care has always been taken to relate the subjects to the natural interests of the children, and the plays are selected with reference to their imaginative, artistic, and historic content.

We consider this dramatic training of great educational value, and the plays which represent weeks of careful preparation, are given on exactly the same basis as are the recitals of the Hull House Music School, or the exhibitions of the Hull House Gymnasium.

No child is allowed to appear in more than two plays a year, and if during the rehearsal of the first play his school work has suffered, or if he neglects his other appointments at Hull House, he is not allowed to appear in the second play. During this training the child lives at home and is regular in his school attendance. He merely has the added education and stimulation of dramatic training as other Hull House children have lessons in music, painting and the plastic arts. His training is not for a moment to be compared to the vicissitudes and irregularities of professional stage life.

Our own experience in all of the art schools connected with Hull House leads us to the conclusion that laws protecting children need to apply to "art" quite as much as to factory labor. It is quite impossible to estimate the loss to society of artistic ability of all sorts, because we have failed to realize that talent must be zealously guarded and ed-

ucated, and because we have permitted gifted children to be prematurely exploited for the benefit of him who first chances to discover their unusual abilities.

FIRE AS A SOCIAL DESTROYER[1]

PETER JOSEPH McKEON

That women and children are the principal sufferers by fire is a fact that deserves particular attention at this time. The result may be simply the working of a general law that the weaker members should be the victims in all catastrophes, but the appeal to humanity is none the less strong. The record of lives lost in recent fire disasters in the United States bears out this statement.

In the Iroquois Theater fire in Chicago in 1903, which occurred at a Christmas matinee, the dead numbered 581 and the injured 240, mostly women and children.

The next year, 1904, the excursion steamer, General Slocum, took fire in the East river, New York, resulting in the loss of 950 persons, nearly all women and children on a church picnic. The pathos of this terrible disaster was intensified by the fact that most of the victims came from a certain section of the city which was practically a village in itself, so that the catastrophe meant the death or disruption of a great number of families.

In January, 1908, at a theater fire in Boyertown, Pa., nearly 200 women and children were killed.

In March of the same year occurred the fire in the school at Collinwood, near Cleveland, in which 173 lives were lost—two women teachers and 171 children.

What takes place when the victims number hundreds and even close to thousands is repeated when the destroyer is content with dozens and scores. The crowded East Side of New York, and all tenement districts for that matter, have fatal midnight fires as regular as the seasons.

All that human skill and bravery can do is done by the firemen. Ladders are raised to help relieve the fire escapes loaded beyond their working capacity. Life nets are spread to catch the human bundles self-flung to the pavement as a choice to roasting in the flames behind. Bridges and chains of stout limbs and bodies are constructed where apparatus does not avail. The work of rescue is performed as well as it ever can be done, but, when the last final search is made, there are the dozen or score who awoke too late, or being sick and helpless were doomed like trapped beasts in the jungle.

A list of these fatal tenement fires in New York shows with what regularity they occur:

Year	Location	Deaths
1903	426 Eleventh avenue	25
1904	164 Attorney street	14
1904	186 Troutman street	12
1905	105 Allen street	17
1907	222 Chrystie street	16
1907	251 East 109th street	12
1908	71½ Mulberry street	11

Women and children supply most of the victims for these fatal tenement fires. In fact the firemen report that all too frequently they find the men in the street, clamorously beseeching the firemen to save the women and children they have left behind. This may be due to a racial lack of physical courage, or it may be simply accident that the men are able to make their escape. It is only too true, however, in most fire panics the firemen are called to deal with, that they have to beat back the men in order to give the women and children the first chance to reach a place of safety. On one occasion known personally by the writer, a fireman straddling the window sills from one building to another had to punch an excited Italian before he could get him to stay and help carry his family from window to window.

What these men of the tenements do is not very different from what other men do in time of fire. It is not fair either to lay a general accusation of cow-

[1] This brief summary of the social aspect of fire losses—life and limb and property—is most timely in this first issue of THE SURVEY following the factory fire at Newark, N. J., in which twenty-four persons, all women workers, lost their lives, many others were injured and hundreds were thrown out of employment at the beginning of winter. An estimate of the social cost of the Newark fire will be published in an early issue with the co-operation of Mr. McKeon, who is a consulting engineer on fire insurance and fire protection, and the advisory member on fire protection of the State Charities Aid Association's New York city visiting committee.

ardice against men because they fail in the test by fire. In all too many cases the men are helpless themselves. Fire is master from the start and it is a hopeless conflict. All that human strength and courage can do is to perish with the people in danger. The attack is so sudden, so strange and new, the ways of meeting it unknown, the weapons not at hand or unfamiliar, that even the bravest men find themselves struggling with some superfoe. Flesh and blood simply cannot be opposed to this withering element. Is there anything more heartrending than the order by the fire chief, "Look under the beds for the children." That is part of the Fire Department routine at a tenement fire, to search for the bodies of abandoned little ones.

After a recital of deaths by fire as an item of human suffering, it is an anticlimax to refer to the loss of property. Yet the claims of the living deserve attention, and fire is a factor in the cost of living that cannot wholly be ignored. It has long been matter of observation by the Fire Department that people in tenements and even the better class of dwellings do not carry fire insurance. The investigation conducted by Robert C. Chapin on the standard of living in New York showed that in a group of 318 families, only forty-two per cent had provision for loss of property by fire. Of this forty-two per cent, the Italian families carried no insurance, only thirty-two per cent of the American, Irish, German and colored families carried insurance on property, while the Russian and Austro-Hungarian with eighty-nine per cent, were the only groups that carried it to any extent.

The subject has never had even the most superficial investigation, but the observations of the firemen are trustworthy enough to demonstrate that people in dwelling houses suffer considerable financial loss. A fire in a dwelling house means smoke damage, not actually destructive of clothing and furniture, but sufficient to cause some loss; it means water damage, which causes positive damage and loss to clothing, furniture and food, and it means heat and flame damage, which renders practically useless nearly everything in the apartment. The loss of clothing means a loss of personal equipment which must be replaced at some expense, and the damage or loss of furniture and food means a loss of home equipment, which must be replaced at some expense. If it be considered that both the personal and the home outfits are secured after very great difficulty, and in many cases by the savings of months and years, it is evident that their loss or damage amounts to an economic tragedy for the poor.

In addition to the financial loss caused by damage there is the loss of income due to loss of employment caused by temporary or permanent stoppage of business resulting in the laying off of workers. Even a slight fire in mills and factories may throw hundreds of workers out of their jobs, while the total destruction of large plants sometimes works a permanent and disadvantageous change in employment conditions for thousands of workers. In a number of instances the burning of one establishment meant the destruction of a town's principal industry, which was also the only means of livelihood for most of the inhabitants.

If fire can be thus proved a destructive force in our living conditions, it is fair to ask what steps are being taken to control or minimize it. Even from the random and incomplete figures of loss in this article, it appears worthy of some remedial efforts by the great agencies that are today working for social betterment. As an economic problem, it is hardly yet in the first stages of solution; as a social problem, it is in a state of utter neglect. The best evidence of this is the absence of statistics. In New York, the great center of organized philanthropy and charity, there is no source, public or private, from which useful data on fire can be obtained. If the preliminary research has not been performed, it is hardly to be expected that remedial measures have either been projected or are in process of application.

THE WESTMORELAND STRIKE

A WESTERN PENNSYLVANIA STRUGGLE WHICH HAS BEEN GOING ON NINE MONTHS AND OF WHICH THE PUBLIC KNOWS LITTLE OR NOTHING

SHELBY M. HARRISON
PAUL U. KELLOGG

The scales clatter down from the hand of the granite statue of Justice on the Westmoreland county court house;—the American flag is ordered furled on the public highway by state police with guns;—in a high field at the Heath Farm, which hitherto has been the haunt of nothing more gruesome than scarecrows, mine-workers on strike string up the effigy of a "scab," which dangles by its neck in the wind;—in the little Catholic cemetery on the hill overlooking Yukon, which was given to the Church of Our Lady of Sorrows, the Slavic Father has planted a cross over a solitary grave, so he tells you, that the coal companies may know they cannot "buy a priest's body and soul."

If this were an age of superstition, men might find in these things omens of bad blood and ill-times afoot. And in this year of 1910 they are symbols on the one hand of the miners' insurrection (President Hutchinson of the Westmoreland Coal Company calls it "civil war") which for half a year has racked Westmoreland county, and on the other, of the lengths to which some of the operators have gone in their efforts to retain absolute authority over the coal pits of the region.

Of the existence of civil strife, the observer needs no signs nor tokens. It is here in its grim realities elbowing the customary routine of the farms and villages of this old Pennsylvania countryside. Tented hill-sides shelter evicted families, processions of rough clad miners led by fife and drum, flying Old Glory, tread the township roads, mounted troopers rattle six-shooters at their hips, rations by the wagon load are daily distributed by the union commissary, people have been arrested, half a dozen men have been shot dead, and non-participants, business men of Pittsburgh and others who made overtures toward peace, have been labeled "presumptuous and officious." Such a situation calls for a statement, both of what has happened and what, so far as an outsider can judge, are the social causes which underlie it.

Westmoreland is one of the largest and most important counties in Western Pennsylvania. Geographically, it lies in the great angle between the Allegheny and Monongahela rivers. Pittsburgh is twenty miles to the west, and the Westmoreland coal fields extend east toward Johnstown under the foothills of the Al-

Map by Alexis Sokoloff.

WESTMORELAND COUNTY.

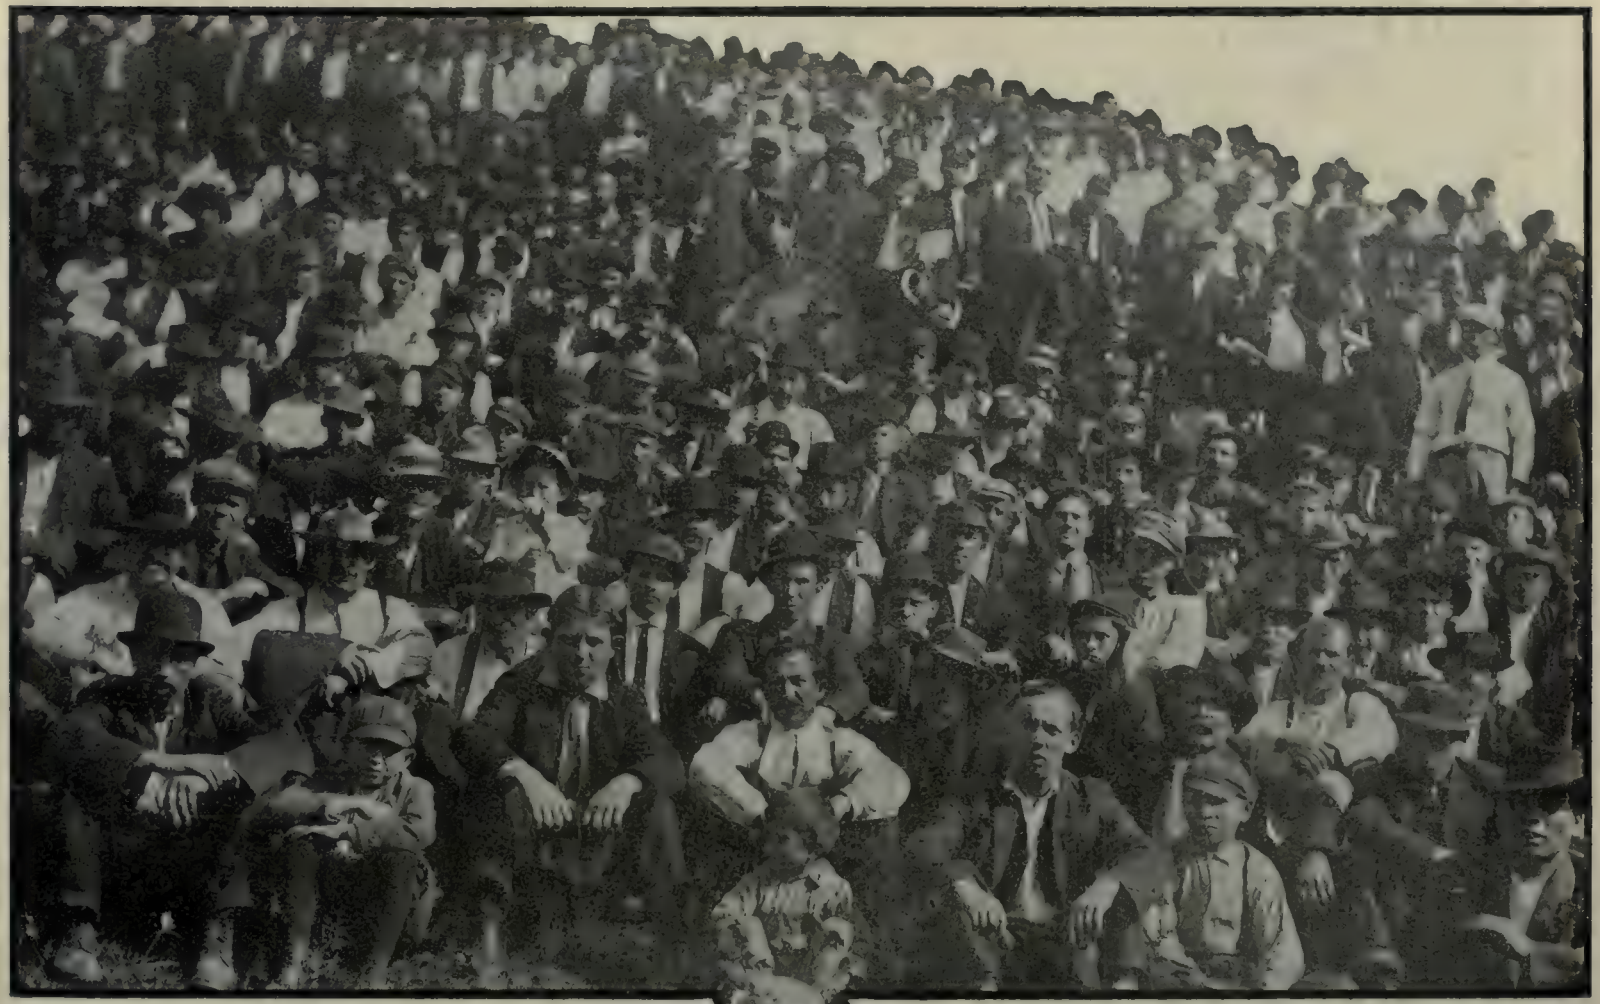
leghenies. Greensburg, the county seat with a population of 15,000, Latrobe, Jeanette, Irwin, Yukon, Madison and Export stand out as the larger centers, and the principal companies are the Westmoreland Coal Company with headquarters in Philadelphia, the Penn Gas Company and the Manor Gas Company, both controlled by the Westmoreland Company; the Keystone Coal and Coke Company, Jamison Coal and Coke Company, the Berwind-White Coal Company, the Latrobe-Connellsville Coal and Coke Company, the Skelly Coal and Coke Company. The main line of the Pennsylvania Railroad runs through the district, sends arms out in all directions to the mines, and carries practically all of the coal loosened in the region.

From the standpoint of labor organization, the region lies between the Connellsville coke fields, where there have been no unions since H. C. Frick won his strike there in the eighties, and the Pittsburgh territory which makes up District No. 5 of the United Mine Workers of America, where the men have been making collective bargains with the operators for twelve years. In normal times from 17,000 to 20,000 men, Slavs predominating, are employed in the Westmoreland mines. The unions have hitherto been unable to get a permanent footing among them; and unlike the recent strike in the bituminous field of Illinois, this uprising has not been one of men thoroughly organized when they went out.

The control of the operators has been so complete, that the coming in of representatives of the United Mine Workers was to them an invasion of their territory by an enemy of whom they had ill opinion, and resented as such. They charged that these outsiders fomented the trouble, and that they had had emissaries at work six months before it began. This is denied. That the United Mine Workers have organized and backed up the Westmoreland men is a clear and open fact; equally certain would it appear that the men in more than a few of the mines had a stored up body of grievances, long battened down by the administrative policy of the managements. This needed only a fuse to set it off.

The fuse, oddly enough, was the new explosive introduced in January and February as a measure of safety in line with orders of the state mine inspector.[1]

At about the same time a new safety lamp was adopted by the companies and its use required also. As miners are paid by piece rates and have to furnish their own explosives, such changes in equipment are matters of cash to them. Dissatisfaction first developed among work-



[1] The state inspector selected ten or a dozen explosives as permissible, and after experiments the companies made a selection of the substitute to be used in Westmoreland for black powder. The introduction of the new explosives was the cause of trouble in the neighboring district, also, between the unions and the operators. To quote President M. H. Taylor, in his Tenth Annual Report to the Stockholders of the Pittsburgh Coal Company for the year ending December 31, 1909: "The question of permissible explosives has been the only difficulty with labor during the year, due to the State Mining Department insisting upon their use and the miners resisting their introduction on the ground of a claimed reduction in their earning power. The question is one of vital importance, as black powder is believed to be the greatest menace to life and property that the industry contends with in the way of explosions and mine fires."

ers of the Keystone Company. Holding that the new lamp gave less light than the old, and that the new explosive broke up the coal finer than black powder, they claimed that they could not earn as much per day as before. The operators, on the other hand, state that while it takes more intelligence to use the new explosive, the results when it is properly handled are as good. (A bungler might well be a heavy loser, but that isn't the type of man you'd want to trust with black powder.) An officer of one of the companies stated that it employed demonstrators, and that the trouble lay in the men not giving the new charge a fair trial. But whatever the results were to be in the long run, it is fairly clear that the losses incident to the period of introduction were for the most part borne by the men, a distribution of the burdens of progress in which they had had no voice. Various estimates as to the drop in wages occasioned by the changes range from two per cent to twenty. One outspoken operator put it as high as five; a fair intentioned miner as low as ten. Changes tending to make a hazardous occupation less hazardous are naturally welcomed by the more intelligent miners, but habits of work are stubborn, and wages and the high cost of living were at such a point as to make the men slow to submit without a protest to anything that was cutting their pay.

A matching up of individual complaints led to indignation meetings in Greensburg in early March, to which miners from other camps were invited. The powder grievance was aired in the meetings. Following the second meeting twenty or more of the men in the Keystone Mines were discharged, one having been an employe for twenty-four years. The company's reason, as stated to us by a superintendent, was that these leaders had been reported as talking "very ugly against the operators." This action crystallized the movement toward union organization and the company was informed that unless the discharged men were reinstated, the union recognized, and the wage scale fixed on the basis of that in the adjacent Pittsburgh district, all the men would strike. The company refused the demands, and the 1,300 Greensburg miners left their jobs.

Plans were set on foot to extend the strike to other mines. The men formed in columns and marched from one mine to the next accompanied by bands and banners. The response was widespread. By the end of May, practically all the workers in the district had been affected. The largest number of men out on strike at any one time reached something over 17,000. Of these, by October, perhaps 10,000 had gone to other districts and 2,000 had gone back to work in their old places; some had, no doubt, shifted to other mines in the Westmoreland district, where they would not be known, but the great part of the remaining 5,000 were keeping up the fight. To fill their places the companies had brought in laborers from a distance. In the face of the many claims and counter claims, it is hard to get at how many of the old men remained at work, and how many of the strike-breakers have stayed and dug coal. Such indications as seemed reliable would put the output for the whole county during September as about fifty per cent normal. This estimate was acceded to by one of the operators who claimed, however, that while some of the smaller mines had done no work at all since spring, the five largest companies in the district, who were bearing the brunt of the fight, were getting out seventy per cent. Eighty-seven per cent of the Westmoreland force in September were new men.

Many of the workers lived in company houses, and strikers who did not move out when notified were evicted. To shelter them the United Mine Workers supplied about 500 tents during the summer. Land was leased, and camps, usually of from ten to twenty tents each, were put in commission. A bed or two, sometimes a table, several chairs and boxes, a few kitchen utensils, a provision basket and a pile of clothing furnished such a tent. The stove stood outside, and in some camps one stove cooked for several families. In warm, dry weather tent life did not prove unpleasant; but in the spells of wet weather everything became damp, the ground muddy, and general condi-

HEATH FARM, WESTMORELAND COUNTY, PENN.

A MASS MEETING AT ONE OF THE RURAL CAMPS.

FAMILIES EVICTED FROM COMPANY HOUSES: YUKON.

tions very bad. Most of the tents had but the one compartment and afforded no privacy for women or children. During the summer a number of babies were born under canvas, and the care of the mothers was necessarily inadequate.

Men willing to work at the wages and under the working conditions offered by the companies have been placed in the houses from which these families were ousted. Their presence has been resented and there has been a succession of cases of strikers catching strike-breakers on the street corners, and at other places away from the mines, and beating them up. For instance, one of the companies charges that twelve of its men were surrounded on the way to the evening train in Irwin on June 24 and beaten with blackjacks, brick-bats, empty beer bottles and clubs; that thirteen men were mobbed at the Pennsylvania Railway bridge at Irwin three days later; that on July 29 two hundred strikers from the Criterion Mine threw stones at the tipple and the houses where the strike-breakers were lodged; that on August 1, late at night, a crowd passed the home of John Ayres, called him an "old scab" and "blackleg," and promised him that his soul would be in hell before another week; that on August 3, a crowd of strikers stationed themselves on the hill opposite the houses at Shaft No. 2 of the Westmoreland Company, where the working miners were living, and proceeded to shoot into the houses.

This sort of friction dated back, however, to before the importation of the strike-breakers, the companies charging that numbers of their old men were intimidated at the outset. As to the demonstrations from mine to mine which inaugurated the strike last spring, it may serve to quote from a memorandum prepared by the superintendents of the Westmoreland Coal Company and approved by President Hutchinson. It should be read with the clear understanding that the statements are those of observers hostile to the men who participated in these rural marches, which were in a way reminiscent of the old time agrarian risings which have marked English history:

> Early in April, in fact at least two months prior to that time, the United Mine Workers had determined that the Irwin Field must be organized. The news of this understanding had a great influence throughout this region.
>
> On April 6, the miners who live in the vicinity of our Westmoreland shaft, namely, Westmoreland City, governed by this understanding, which had been thoroughly discussed at previous meetings held locally, decided that no one should be allowed to go to work on this day. The morning of the above date was very foggy, and as the men were on their way to work at the above mentioned mine, the Township Road was lined with the then so-called strikers, who fired volleys of stones, bolts and clubs, and threatened all the men whom they met with bodily violence and that their houses would be burned, their wives and babies murdered, and with this emphasis to their remarks said that "no one should work in that mine except they belonged to the United

A SQUAD OF MARCHERS.

Mine Workers of America," and said that they were acting under the direction of Francis Feehan, president of No. 5 District, United Mine Workers of America. In addition to this mob violence, they kept up a continual firing of revolvers and Winchesters until the fog lifted late in the forenoon. This performance was renewed at twelve o'clock at night and kept up until daylight the next day. Throughout all this time of mob rule there was no indication of any desire or efforts of any of the local peace authorities, or the sheriff of this county, to protect the interests of the company or its employes.

On April 11, between five and six o'clock in the morning, while our workingmen were going to Criterion Mine, they were met by about four hundred (400) marching strikers, who used all kinds of tactics to prevent them from going to work. Several of our employes were badly beaten up, several of the dinner buckets were taken from others and a riot was avoided only by the retreat of the men who desired to go to work. Notwithstanding the general knowledge of the situation in this vicinity, and the riotous methods adopted by the strikers, no effort was made by any of the local authorities to prevent these lawless actions.

On April 16, after a mass meeting held in the vicinity of our Export Mine by striking miners who came in from other mines then on strike, the men at work at Export Mine all stopped work and on the following night our mine foreman's house was set on fire. No effort was made on the part of the local authorities to apprehend the persons connected with this outrage.

On April 28, the situation throughout the entire field was serious. At Export about six hundred (600) men and seventy-five (75) women marched through the town from three o'clock in the morning until seven o'clock. At our Criterion Mine on the same morning, there were about fifteen hundred (1500) men and one hundred (100) women marching at four o'clock. There was stone throwing, howling, and everything was resorted to to intimidate men from going to work. At Westmoreland shaft on the same morning there were about two hundred (200) men and a lot of women who attacked the men going from work in the afternoon and six (6) of the workmen were badly beaten up; one of them in particular had to have the attendance of a physician, who put several stitches in his scalp.

On June 17 a mass meeting was held on the field, opposite Penn Mine No. 5, where about fifteen hundred (1500) strikers were assembled. On the way to the meeting ground, the marching strikers were met by the sheriff of Westmoreland county, John E. Shields, who asked the leaders to stop and disperse. The leaders disregarded this request, pushed the sheriff off the main public road into the ditch, and passed on to the meeting ground. When the meeting was about two-thirds over some of the striking miners, incensed by the sight of coal coming out of our mine, rushed down over the bank, stoned our workingmen, smashed all the windows in the motor house, and intimidated and threatened and drove the workingmen away from the mine. They were stopped from further destroying property only by deputy sheriffs who threatened to shoot if the men advanced to commit any further depredations. The local constable of Hempfield township and the constable of the Borough of Penn were in attendance at this meeting and made no effort whatever to disperse the crowd or quell the violence.

These early demonstrations occurred some months before we visited Westmoreland county. It is plain that feeling ran high, the men, hitherto unorganized, acting in undisciplined bodies. It is perhaps unnecessary at this date to attempt to decide too nicely as to the weight to attach to the conflicting versions of what happened. In September, we attended a meeting at the camp on the Heath Farm, which was later described to us by Keystone officials as an occasion when the talk was violent. A scarecrow effigy with miner's cap and pick stood on a pole in the center of the hill and the speaking,

which was in three languages, was listened to by a crowd of 1,500 men, seated about on the grass. What the English speakers said was not calculated to inflame their listeners, but to hearten them to hold out and keep up the fight; and apparently the Slavic and Italian leaders spoke in similar temper. The strikers resorted only to handclapping in showing their approval. In the shade of some big trees were family groups, and some of the men helped their women tend the babies while the speaking was going forward. The crowd had come over from Latrobe and Greensburg in two processions, with band and banners. The marches to and fro were wholly orderly, a truly remarkable showing considering the numbers involved, the length of territory traversed, the breaking up of one delegation by the police, and the fact that the conflict, with all its irritations, had been going on for six months.

In the memorandum quoted above, it will be seen that the companies charge that the local police officers and county authorities did not make adequate efforts in early spring to preserve order. This they give as justification for the means they thereafter employed to protect both their property and their new employes. The more serious clashes, however, have not been between the strikers and the strike-breakers, but between the old miners and the various peace officers who have been called in. One company of the Pennsylvania State Police is regularly stationed at Greensburg, a second was called in as reinforcement. A company when full numbers fifty-five men. In contrast to their fellow guardians of law and order, these mounted men are a disciplined lot, some of them having seen army service. They are fearless and as a rule they show judgment in the use of weapons, winning the respect of local public opinion and of the strike leaders. Whatever the point of view of the commanding officers, however, that of the rank and file is a limited one, and in an industrial dispute is likely to be warped to the purposes of the side whose property they are protecting. When we asked a trooper in Latrobe what he did when the foreigners raised trouble, he said, "Ride in and scoop 'em up, and beat hell out of 'em." They were Hunkies to him.

The locally commissioned officers have been of a different sort. Private watchmen and a few deputy constables have been used, but deputy sheriffs form the largest element in the force. At one time these numbered over 400, and over 200 are still employed. Beginning in May, these men have been sworn in by Sheriff Shields of Westmoreland county, but are put on the payrolls of the companies at three dollars a day and expenses. Over seventy-five per cent of the deputies are non-residents of the county and are regarded with suspicion by responsible citizens with whom we talked. Many of them proved to be heavy drinkers, and instances were cited where local sa-

The men in the front row, beginning with Van Bittner at the left, are organizers of the United Mine Workers. Between them, they can speak half a dozen languages effectively.

loon keepers shut them off from their bars in the interests of public safety. Since the strike began, two of them have been shot dead and another wounded by fellow-deputies, one of the murders occurring in a "speak-easy" brawl over a game of poker. Individuals of this stripe have been armed with modern guns and a star and turned loose to deal with the strikers. "We employed deputy sheriffs," said an operator, "because they were the only sufficient protection we could get, and the deputies employed were the best caliber of men which the coal companies could secure. Pretty soon the worthless ones were culled out and those that remain understand their duties, and make pretty efficient watchmen. If it had not been for the deputies our mines wouldn't have been running fifty per cent of what they are now."

The strikers and their sympathizers have not been slow to call names after the deputies and state police, and in a number of clashes deputies have been hit with clubs and stones, suffering minor flesh wounds. The two most serious cases of violence charged against the men on strike took place at Claridge and Export. To quote the Westmoreland Company's statement of the former:

> At midnight on September 26, at Claridge, Pa., seven shots were fired into House No. 14. This house was used as a boarding house for the working miners and there were twenty-seven men in the house at the time that the shots were fired. Four of the bullets passed entirely through the house, two of them striking the beds upon which the boarders were sleeping.
>
> About nine o'clock on the night of the twenty-seventh of September two bullets were fired through the house of the mine superintendent and two through the house of the mine foreman. There were twelve children, three women and the two foremen in this house. There is no doubt but that this shooting was done by striking miners, as no other person would have any reason to shoot through a house containing innocent children and women if the object were not to intimidate the foremen who have charge of the mine at that place. Under cover of darkness the perpetrators of this act disappeared and up to this time have not been apprehended. This company immediately offered a reward of $500 for the apprehension of the parties guilty of this dastardly act. In addition to the $500 reward offered by this company, a reward of $500 was offered by some of the citizens of that community, but there was no effort made on the part of the local police or township constable to investigate or try to apprehend the persons doing the shooting.

Organizers of the United Mine Workers are sceptical as to the above incident. They point out that many shots were fired and nobody hit; while the presence of women and children under fire was calculated to rouse public indignation over what had the ear-marks of an atrocity. They maintain that they have been unable to learn of anyone among the immigrant strikers who participated in the shooting. They point to cases, as in the Colorado mining troubles a few years ago, where company agents set off dyna-

EXPORT.
Where a company house was fired and there was shooting from the hilltops.

mite in order to discredit the men. The company, on the other hand, having offered a reward for the lawbreakers, asserts that here was a chance for the strike leaders to serve their cause and make money in doing it, by bringing in some evidence that the shooting was the work of deputies.

The Export case was described by one operator as a "dastardly attempt at wholesale murder." The town is located in a narrow valley, making most of the houses distinguishable from the surrounding slopes. On the night of July 15, a centrally located company house burst into flames and shots were fired from the hilltops. The Westmoreland Company charged that strikers set fire to the building in order to draw a crowd and then in the light of the blaze to pick them off with their Swiss rifles.[1] Circumstantial evidence at the subsequent trial tended to support this charge. The police and company officials say that they suspected the scheme and kept their men away from the circle of light. They state that 150 rounds were then fired, not only into the company houses generally, but into a number of houses owned by private citizens, such as druggists, physicians and merchants, who were accused of being in sympathy with the company. No one was hit. Later that night two state police and a deputy sheriff arrested four strikers who were suspected in the case, and in a sharp exchange of shots a striker was killed, and a constable wounded so seriously that he was likely to lose a leg. At the subsequent trial the arrested miners were convicted of rioting and arson; no one was charged with shooting the constable.

On the other hand, all stages of violence from petty to extreme have been charged against the deputies; for instance, that on April 25 at Rillton, Carlo Caligary was knocked senseless by a blow in the forehead, Deputy Green who struck the blow being later found guilty of aggravated assault and battery; that at Haydenville on June 9, a constable, in arresting three women, beat them, shackled them to the seat of his surry and carried them to jail; that at Hufftown July 12, John Hanck and John Artmar on their way home were attacked by four Keystone men, for no other reason than that they refused to return to work in the mines; that on May 5, without provocation, Frank Bostick was shot twice by a deputy sheriff at Westmoreland City; that the Cohens, a married couple, were in bed over their store near Edna No. 2, when the house was broken into and they were beaten up. The cases, like those charged by the companies against the men, cited on page 350, have not been verified by the writers; they illustrate the type of incidents which are related by the score in the mining towns. Only a public inquiry, with interpreters and power to subpoena witnesses, could get to the bottom of them. An example of the disparity of testimony offered from different quarters is illustrated by the two following paragraphs, descriptive of the same incident on June 12 or 13.

From the Westmoreland Coal Company:

> The statement embodied in the following paragraph is one of facts of the actual occurrence. There were between seventy-five (75) and eighty (80) women who began parading the streets of Export at 4.30 o'clock in the morning on the date above mentioned. They were armed with stones, clubs, empty beer bottles, red pepper and acids. At 5.40 o'clock, they assembled around the gate leading from our mule yard to the public road. As the first driver came out of the gate with his mule, red pepper was thrown in his face and eyes, and stones, bottles and clubs were thrown vigorously at him and the mule. This continued until several mules had succeeded in passing and several of the mules ran away. The state constabulary stood by while this was being done, and asked these women, very courteously, if they would not disperse and open up the public road so that the drivers and mules might pass out and go to their work. This request was not obeyed, but instead they be-

[1] The Kaufmann Department Store in Pittsburgh had a consignment of discarded Swiss army rifles, which people bought for decorating their "dens," etc. Some of these were purchased by immigrants for use in their lodge drills. The Westmoreland operators charge that immigrant strikers used them at Export and elsewhere, using for ammunition "slugs and powder with a round soft lead ball which, when it struck its mark, flattened out making the most dangerous wound" and the "most murderous piece of ammunition that has been used in this country." Justice Trusal of Greensburg, who has handled many of the cases of violence in his court, thought the average immigrant striker unarmed. The organizers of the United Mine Workers state that from the beginning they have urged the men to refrain from carrying weapons.

gan throwing stones, bottles and clubs at the state police. These women were accompanied by men who stayed in the background and said nothing, but furnished the stones, clubs, coal and bottles that were thrown at the police. When the sergeant realized that his efforts were of no avail, in order to disperse the crowd and open up the highway he ordered the hose turned on. This was done and the leaders arrested by the sergeant of the constabulary, who treated them at all times with all the courtesy that is due a woman. After they were arrested and were waiting for a conveyance to take them to jail, these women enacted the most indecent tactics that it is possible for women, calling all persons present all the filthy names that could be thought of, and raising their clothes over their heads, told everybody to look and come to them if they wanted. None of the women were abused or struck by any person, and the water was not thrown on all of them. There were a few in the crowd who did get wet, but the ones arrested were not wet.

From Secretary McCartney of the Greensburg Union, disbursing agent of the United Mine Workers.

Seven women of Export, while on the road in line of march, had a hose of hot water turned on them, with infants in their arms. The steam so thick that it blinded them, the water so hot that it burned them, and the force so strong that it knocked some of them down. Then the state constabulary came up and arrested the women and when they made the request that they be permitted to go to their homes and get dry clothes, the state police sent for clothes and wanted them to strip in the mule yard. When they refused they were taken to jail as they were, children and all, and left there thirty-six hours and getting a hearing were discharged. This case caused a clash in the squire's office. Men openly cursed the state police and told them that if it was a mother, wife or daughter of theirs they would shoot them where they stood. It certainly was one of the dirtiest jobs on record.

Conversations with non-participants in Greensburg and other of the mining towns convinced us that in a number of instances deputies overstepped their authority, beating up miners with little or no provocation and handling women and children roughly. As officers of the law, the deputies have a legal right to resort to force where necessary (as citizens have not except in self-defence), but at the same time, as officers of the law, they should if anything be held to even stricter accountability for any extra legal or unwarranted acts. Now all fatalities which have occurred since the outbreak of the strike have been at the hands of these imported police. Between April and October five miners were killed outright. We asked Sheriff Shields to cite the case in which, to his mind, the deputies were most clearly acting within their responsibilities in shooting to kill. He gave us this:

John Snelling, deputy sheriff, a man who does not drink, was met near the Claridge works at about dusk on the evening of July 13 by about forty strikers. They told him that he could not go on but must go back. He refused to return, telling them to get out of his way, as he was going through. The strikers blocked the way, crowded around to argue, and some one hit Snelling with stones and clay. In the pushing and crowding Snelling says he saw a man named John Pulter reach to his hip as if to pull a gun. Snelling shot Pulter and killed him instantly. Snelling was arrested and held on a charge of murder.

Snelling's trial resulted in an acquittal on the ground of self-defence.

Another case was that of Mike Cekan, a Slav, who was shot at Bradenville on the morning of May 27 and died several hours later at the Greensburg Hospital. Frank Chrowe, superintendent of the Latrobe Coal Company, was arrested, charged with murder and released on $8,000 bail. The circumstances as alleged by Curtis H. Gregg, a member of the bar of Westmoreland county, who acted as attorney at Greensburg for the United Mine Workers, were as follows:

A few minutes before six o'clock, two mounted deputies were passing along the highway having in charge four foreigners. Mike Cekan met them and spoke in a foreign tongue to those under arrest, who then fled. The deputies, instead of pursuing those under arrest, chased Cekan, who attempted to conceal himself in a coal shed. The deputies followed him to the shed and there began to beat him. He pleaded with them not to beat him, saying he had done nothing. While the deputies were assaulting him, his wife arrived and joined in the plea for mercy and asked them to desist. While this was going on Chrowe, the superintendent, came to the scene. The deputies were unable to take Cekan from the shed and were retiring when Chrowe shot through the window. One witness testified at the habeas corpus hearing for the release of Chrowe on bail that Chrowe shot three times. The testimony elicited the fact that Cekan was most brutally beaten before he was shot. Follow-

ing is a description of the wounds, taken from the testimony of Coroner H. A. McMurray, a physician: Left arm above elbow, two abrasions; left shoulder, posterior contusion; right shoulder, posterior contusions and abrasions; scalp wound on top of head about one inch long.

Cekan was survived by a widow and several children, the youngest of whom was an infant in arms. The family was evicted from the company house during the course of the summer.

At the October term of court testimony was adduced tending to show that Chrowe shot Cekan at the moment the latter, with an upraised pick, was about to strike one of the police officers. Chrowe was acquitted by the jury on the ground of preventing an imminent felony.

It would seem that the operators were shouldering a heavy responsibility when, as a measure of self-defense, they brought such an irritating and ill-governed force into the region as the deputy sheriffs have proved. Only dire straits, coupled with inability to secure other protection (which they claim was the case), or other more reputable protectors (which it is difficult to believe) would warrant the employment of a guard of such personnel. Many circumstances, moreover, indicate that the matter has not rested at self-defense. It is, of course, not thinkable that the acts some of these men have been guilty of were part of a deliberate plan of a few of the operators, still less of all. Some of the operators have expressed themselves in unmeasured terms of the caliber of the sheriff's force. There are plenty of indications, none the less, that the use of this force, such as it has been, has not been restricted by the operators merely to the protection of their mine property and the safety of the new men. They have carried on an aggressive program to break up the unexampled opposition to their authority on the part of their former employes. This last they have regarded as the work of a combination of foreigners and outside agitators. They have made efforts to keep the strikers from locating their canvas settlements near the mines and to stop the mass meetings. In the accompanying column is shown an injunction secured from the Court of Common Pleas by the Jamison Coal and Coke Company, prohibiting the establishment of a camp on private property adjacent to its mines. The operators charged that some of these nearby camps were made up wholly of single men, were established merely for the sake of intimidation, and were the source of fusilades of missiles, etc. The strike leaders, on the other hand, held that the superintendents did not want their new men to have such tangible evidence of the persistence and strength of the strike. Injunctions were secured also from Judges McConnell and Doty, prohibiting the miners from conducting marches on the public highway near the mines,

IN THE COURT OF COMMON PLEAS OF WEST MORELAND COUNTY, PENN'A.

SITTING IN EQUITY

No 746 Equity

Jamison Coal & Coke Company, a Corporation of the State of Pennsylvania, Plaintiff,
vs.
United Mine Workers of America, an Association Incorporated or Unincorporated, Marshall Mariscini, et al., Defendants

DECREE

And now June 1st, 1910, this case came on for hearing on motion to continue the preliminary injunction granted May 26th 1910 until final hearing, and after the taking and hearing of all testimony presented it is adjudged and decreed as follows:

That the United Mine Workers of America, an Association, incorporated or unincorporated, Marshall Mariscini, Charles Shaw, Joseph Letherwood and George Thompson respectively officers or members of said association, Christopher Columbus John Morgan, John Mirko, James Simonetti, Jim Lutereski, William Jones, Joe Fullman, Elmer Harris, James Walker, William Hays, George Carling, Joe Leach, Joe Vendelek, Nick Vendelek, Stanley Bogan, Frank Bogan, Charles [illegible], John Hamilton, Frank Chesters, Patrick Duffy, [illegible] Cairns, Philip Loffe, H. Brown, Patrick Cairns, [illegible], Frank Bauat, Anton [illegible], George [illegible], Andy Gregorish, Andy [illegible], Joe Kurtz, [illegible], Lewis, Archie McKinney, [illegible], William Logan, Harry Hessing, [illegible], Joe Hanes, Frank Stanley and James [illegible], and all other persons who may at any time hereafter assemble with them, or aid or assist them in the acts complained of in the bill in this case, be enjoined and restrained from conducting or carrying on meetings to, and past the mines, properties and works of the Jamison Coal & Coke Company, and from assembling at or near the mines of said company for the unlawful purpose complained of in this bill and indicated by the testimony in this case, and it is further decreed that as a means for the accomplishment of such unlawful purpose of intimidation they be enjoined and restrained from entertaining and maintaining camps upon the [illegible] property adjacent to Scalper's Point or elsewhere [illegible] for the maintaining permanently of the picnics and purposes of the conspiracies aforesaid to enforce large [illegible] of men brought from other localities with a view and for the purpose of thereby intimidating employees [illegible] who desire to work for said coal company, [illegible] of personal violence, oppressions, outrages addressed to said employees [illegible] by any other lawful and peaceful means whatsoever to operate in the mines of said complainant or to thereby interfere with complainant in the operation of their mines. This decree to continue in force until [illegible] hearing and until [illegible] order of this Court. Each of the defendants named in the bill as are not specifically named in this decree have not been served by proof or their partial [illegible] in the proceeding [illegible] complained of in the bill, and therefore, the injunction as to them is discharged.

BY THE COURT

Prothonotary

A PENNSYLVANIA INJUNCTION.

where the men at work might see; and "near" was at times construed by deputies and state police as meaning anything up to half a mile. The strike leaders even charge that at various times the deputies have endeavored to provoke the marchers into disturbances which would discredit the strike, or give an excuse for a force, held in ambush, to descend upon them and clean them up. On the way over to the meeting on the Heath Farm, which we attended, the Greensburg column was stopped a mile short of the camp by the state police. No question whatever was raised as to the strikers' complete orderliness, but they were permitted to pass the Jamison mines between Crabtree and Donohue only on condition that they would break ranks, stop their drum and furl their flag.[1]

"What right have you in the constitution to make men furl the flag of the United States on a public highroad?" asked Vice-president Van Bittner of the United Mine Workers, when he met the broken procession, young men and old, trudging along under the eye of the state police.

"I don't care anything about that," said a trooper, "but they've got to keep that flag down or they don't get past."

Reference has already been made to the fact that the companies complain that local peace officers could not be depended upon to keep order and protect property. They also charge that they were unable to get satisfactory action on the part of local squires. For instance, it is alleged that an agent of the Westmoreland Company was attacked on the main street of Irwin on July 28, thrown into the creek and told never to come back. It is further alleged that this happened under the eyes of the local police who did not attempt to interfere, and that when the case was tried, the ring leaders swearing that they were not at the scene of the disturbance, Squire Truxal discharged them and placed the costs on the prosecutors.

The strikers, however, are even more outspoken that the squires have played into the hands of the operators. In support of these charges, it is to be said, as a matter of common experience, that immigrant workmen are little likely to get their deserts in the ordinary ministrations of the alderman's court system of Pennsylvania. Especially is this true when either a local constable or an industrial corporation is the complainant against them. "There's no law in Pennsylvania any more for the poor man,"

The little man at the left is a hunchback, fifty-six years old, whose arm was broken in one of the so-called riots; at the right is Toni Izikowich, whose trial is described in the text. The man in the center, a six-footer, shows by comparison the bulk of the men whom the deputies handled in the rough and tumble.

said a labor leader at the close of a hearing which we attended, the first week in October, and before this same Squire J. Q. Truxal of Greensburg. The case involved Toni Izikowich and Deputy Constable Boyle who had visited the camp near Salemville in order to serve a warrant upon a striker for some minor offence. The testimony was indefinite and contradictory, but it indicated that after Boyle arrested his man, the miners gathered around the two clamoring against the man's going. In the mix-up Boyle, Izikowich, Mine Superintendent Taylor of the Keystone Company and

[1] Said an operator to whom the case was put afterward: "In the view of many American citizens, the flag was being prostituted. The red flag of anarchy would have been a more fitting emblem for the marchers to carry."

several others were shoved into a tent and a number of shots were fired. Each side accused the other of the shooting, but the officers had no guns secured in the camp to offer in evidence of their claim. Toni was badly beaten, dragged to the road and handcuffed. Boyle acknowledged that he struck Toni five times. Toni identified Boyle as the man who struck him. It appeared that several armed state police were near the camp at the time and could have been called by Boyle and Taylor. The charge against Toni was pointing firearms. He entered a cross information against Boyle, *et al.*, and both cases were heard at the same time. In giving his decision, Squire Truxal said:

> The evidence is about a stand-off on both sides. Nothing seems to corroborate anything else. The condition of the defendant, however, is such as to indicate that more than necessary force was used in dealing with him, especially since five or six other officers were near at hand. I dismiss both cases.

The two attorneys for the mine superintendent and the state police smiled at each other and one of them remarked in our hearing, "That's all we wanted."

In conversation with Squire Truxal afterward, he justified his decision by saying, "Knowing how these things go, the chances are that this miner would be stuck for costs if I sent the case into court, and so I dismissed it."

The only comment made by the miners was the one noted; it is to be heard everywhere on the street corners in the Westmoreland towns.

The case of Paolo Valentine, a barber of Rillton, as told among the strikers, illustrates further why they feel that they are at a disadvantage in the courts. They allege that because he called "Hello Buddy" to a handcuffed striker whom he recognized as one of his patrons, he was knocked down and shot at. For the resistance he put up against arrest, he was charged with aggravated assault and battery. Of this he was acquitted, though not until he had spent several days in jail. In contrast, it is alleged that the first squire, before whom he made a counter information, failed to issue a warrant against the two company men named, asked for an extortionate bill of costs, and finally returned a transcript to court for but one of them, whom he released on his own recognizance. Only when the case was taken up before another justice on a new information were the men put on bail; later they were found guilty in quarter sessions of felonious assault and pointing firearms.

Most of the cases never get beyond the hearings in the squires' courts. Altogether, around one thousand miners and strike sympathizers have been jailed in the course of the strike; more than that, the coal companies, acting in concert, secured warrants in August calling for the arrest of eighty-seven local and district labor leaders on charges of conspiracy.

With these things going on, by a mere chance the scales fell from the statue of Justice which decorates one of the gables of the county court house. It occurred when court was in session; small wonder that immigrant strikers referred to it as having some supernatural meaning.

One further fatality, a case which ramifies in several directions, may close the series of illustrative examples:

> On Saturday, May 7, one Peter Leybach, a Croatian employed by the Westmoreland Coal Company to secure "strike-breakers", arrived at Yukon with three men. The three left their clothes and other belongings at East Yukon, a section of the town not owned by the company, before going to the company property. Next day, Sunday, when they returned for their clothes, they were interviewed by the Slavic strikers. As a result, they joined with the strikers and in company with Peter Leybach went to a Polish house in Yukon proper. The strikers furnished them their meals and advised them to leave the district. Shortly after noon, eight deputies came to the house and asked for Leybach. When Leybach and the men came out they told the deputies that they had made up their minds not to work for the company. The deputies went back to their barracks, and at about four o'clock, twenty-five of them, marching in double column, armed with rifles and revolvers, returned to the Polish house and demanded admittance. In the meantime, Leybach and his fellows had left. When Mrs. Sentine, the boarding-boss, refused admittance, one of the deputies pushed her aside, entered and searched the house. A crowd had gathered and when the deputy was unable to find the men, they laughed and jeered. One deputy lost his head and fired a shot. Thereupon, the deputies knelt and let off a volley to disperse the crowd. This was responded to with stones. The deputies made their way out of the yard, shooting in all directions. Many

houses show bullet marks, thirty persons were injured and Paul Renomeno was killed. Only four persons were shot on the streets, the others being on porches, steps, in houses or in their own yards. Hearing the noise, Renomeno rushed from his house and at his own gate a bullet struck his breast. Eighteen deputies were arrested and subsequently released upon $3,000 bail. After their trial, in October, the jury returned a verdict finding all the eighteen guilty of voluntary manslaughter. The case was appealed, but a majority were unable to furnish bail and were sent to jail, where they are still being held.

The story, as told us in several quarters by men who sympathized with the strikers and were present at the trial, is as given above. Differences in language, and the feeling of bitterness engendered when a man's comrades or kin are the unarmed victims of men with guns, add to the difficulties of getting at the exact steps in such a conflict. The important details given by my informants were identical. On the other hand, an official of the Westmoreland Company stated that he had never been able to get two people to agree as to what had happened. He thought it a case of nerves; the deputies got frightened; and he is confident that in the new trial they have asked for they will be acquitted.

Yukon is a comparatively new mining settlement, and in line with their usual custom (a custom which the officers say has had no ulterior motive), the Westmoreland Company, just before the strike was declared, had deeded 1.6 acres of ground there to Bishop Canevan of Pittsburgh for the purpose of building a church, school and parochial residence. Paul Renomeno was buried in this ground. Behind that fact lies considerable of a story involving E. G. Smith, superintendent of the Westmoreland Company at Irwin, and the Rev. M. Tusek, priest of the parish. It was a saying of Mr. McCullough, late president of the Westmoreland Company, that "the Catholic Church is the only church which can control this class of people," referring to the miners. The saying is recalled by his associates as made in all kindliness, the company, they say, never attempting to influence improperly any priest of the church. Subsequent events, however, indicated that at least one officer of the company had not looked for

REV. MICHAEL TUSEK.
Priest of the Church of Our Lady of Sorrows, Yukon.

opposition from the quarter benefited. For their part, the company officials charge that the Slavic priest had wanted the company to serve his own ends—to collect church dues for him from the pay envelopes of his parishioners, and to discharge certain men who wanted to organize a fraternal lodge outside the church, and was disgruntled because they would not do so for him. When the strike broke out they regarded him as a trouble breeder, and on March 21 he received the following peremptory letter:

Rev. Tusek:
Yukon, Pa.

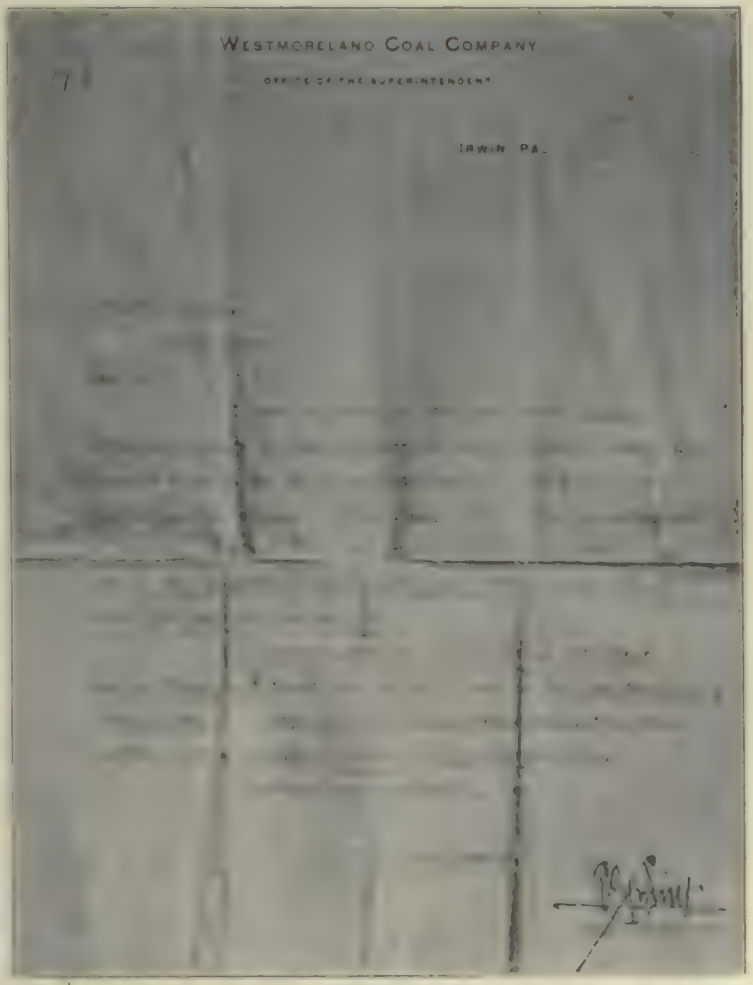
Dear Sir.—I have information that you are bringing a certain pressure to bear on some of our workmen at Yukon, and I would like to say that any interference from you or your church people coming at this time, will be very detrimental to the Westmoreland Coal Company.. I will, therefore, ask you to drop everything concerning your church organization until you have advice from me.

I shall insist on your carrying out these instructions and trust that we will have no further derogatory information. I hope you will acknowledge receipt of this letter, with a promise to carry out my instructions. Thanking you in advance, I am

Yours truly,
E. G. Smith,
Superintendent.

A week later another letter followed:

Rev. Michael Tusek:
Yukon, Pa.



Dear Sir.—On March 21 I wrote you a

letter concerning several matters, and in that letter I asked you to acknowledge receipt of it with the promise to carry out my instructions. To date, I have had no answer, and am writing you now to ask if you will please comply with my request.

Yours truly,
E. G. SMITH,
Superintendent.

Father Tusek claims that he held to a neutral course up to the time of the receipt of the second letter, but that these letters, coupled with inquiries he made into the causes of the strike, led him to take up the cudgels for the men who had left off work. In reply, he came out with a public statement to the effect that he was "not a priest of or for any company, but a priest of the Roman Catholic Church and for the people who constitute the congregation," and that he would "not accept any advice nor carry out any instructions of any company or its officials."

Friction continued between priest and company in the succeeding weeks. Father Tusek was arrested for trespassing on company property and fined in a squire's court. The company claimed that under guise of making pastoral calls, he was visiting the men in the company houses and inciting them not to work. Then, early in May, came the Saturday when the deputy sheriffs marched down on the Polish house in Yukon where Peter Leybach, the Croatian strike-breaker, was thought to be in hiding, and in the shooting affray that followed thirty-one persons were injured, mostly Father Tusek's parishioners, and Paul Renomeno was killed. In the absence of a church burial ground, the priest decided to lay

WESTMORELAND COAL COMPANY

OFFICE OF THE SUPERINTENDENT

IRWIN PA.

A COMPANY SUPERINTENDENT'S INSTRUCTIONS TO A PARISH PRIEST

The underlining is Father Tusek's

the remains temporarily, at least, in the plot given by the company to the Church of Our Lady of Sorrows. Of his reasons for doing so, Father Tusek said:

Why did I allow this? First, because I wanted to give a little satisfaction to the outraged people; and secondly, because I wanted to give the officials of the Westmoreland Coal

Company a dose of medicine which they generally like to prescribe for other people, but do not like to take themselves; and, also, because I wanted to make them understand that by a donation to the church they do not and cannot buy the priest's body and soul.

We have seen, then, a rising among the miners of these Westmoreland hills. In the face of it the ordinary machinery of law and order broke down. To meet the situation, the companies called into play an armed force of such a character and injunctions of such a nature as enabled them to continue operations, but these, if anything, occasioned even more violence than before (partly the acts of the men enlisted to enforce the law and the injunctions). The strikers, largely immigrants, to an extent controlled by the labor organizers, have held out for nine months and have resorted to sporadic violence. The events of the summer have not been of a sort to give assurance of the sufficiency of the social machinery of Western Pennsylvania to deal with such an industrial crisis, or to train the immigrant workmen into a knowledge of American ideals in government and citizenship. It remains to look further into the causes underlying the strike and to ask what efforts, if any, have been made toward settlement.

STRIKE CAUSES

The cause of the strike as viewed by the operators is the desire of the United Mine Workers to organize the Westmoreland fields, thereby increasing their revenue, bringing all miners under the one powerful organization, and incidentally giving the officers of District No. 5 prestige in the internal policies of the national body. They claim that before the first outbreak, agitators had been in the county stirring up discontent with the one purpose of unionization. The companies object to unionism and the machinations of these outsiders last spring, they say, caused the break in relations between themselves and their men. The union leaders reply that they are no more outsiders than the stockholders of the Westmoreland Coal Company, for example, which is an old Philadelphia company with headquarters in the eastern end of the state; that they have been trying from time to time for years to organize the district; that the presence of organizers and their purpose have been known, and that if the men want the union they have a right to have it.

The strikers, on the other hand, sum up the issues at stake as wages and other conditions of employment, and the right to organize to improve them. The powder question, they assert, simply brought their grievances to a head. First, excepting the mines of the Westmoreland Company and a few of those of the Keystone Company (these exceptions are important and should be borne clearly in mind), practically all of the workers in this field are paid not by the ton, but by the wagon load. They say that the size of the wagon has been increased from time to time and that they are made to "hump up" the coal above the level of the wagon top, without a corresponding increase in the pay per wagon. They therefore want to be paid by weight, and to be permitted to place a check-weighman at their own expense at each mine, to see that their coal is properly weighed and credited. At several of the Keystone mines, the men have their own checkers; and the president of the Westmoreland Company concedes the men this right under a state law[1] (declared unconstitutional in Allegheny county), and states that it is optional with his men whether or not they have one. No request, he says, had been made to his company prior to the strike. To his mind, the real reason for the absence of check-weighmen at the West-

[1]Article 13, Section 8, the bituminous mining law, reads as follows: "That at every bituminous coal mine in this commonwealth where coal is mined by weight, the miners or a majority of those present, at a meeting called for that purpose, shall have the right to employ a competent person as checkweighman, who shall be permitted at all times to be present at the weighing of the coal. He shall also have the privilege to balance and examine the scales and he shall not be considered a trespasser during working hours while attending to the interests of his employers and in no manner shall he be interfered with or intimidated by any person, agent, owner or miner. When differences arise between the checkweighman or owner of the mine as to the correctness of the scales, the same shall be referred to the mine inspector of the district where the mine is located, whose duty it shall be to regulate the same at once." This act has been declared unconstitutional by the county court in Allegheny county, on the ground that the "title of the act does not give notice of the penalty." Commonwealth *vs.* Hartzell, 5 D. R. 148. (1895). The constitutionality question has not been taken up to the Pennsylvania Supreme Court, but the Pittsburgh decision would doubtless have an influence in other counties if the point were raised.

moreland tipples is that the men soon imagine that the checkers are secretly in the pay of the company (this is reported to have been the cause for their discontinuance at certain shafts in the past), and the real reason why the union leaders want to install them is not to check up the tonnage, but to have an agent handy who can call out the men at every whip-stitch and harass the management. It should be borne in mind, however, that the Westmoreland Company has been opposed to collecting the wages of such check-weighmen from the pay envelopes of the men in the pits, and that the company's unwillingness to do so, coupled with its policy of keeping the men from organizing, has practically blocked any stable method of financing check-weighmen on the part of the men; a situation which may have fostered naturally enough the suspicions referred to.

Such inquiries as we were able to make as to the wagon system of payment, seemed to indicate that the grievance was not so much that the practice reduced earnings to any large extent, as that it kept the men in the dark when they wanted to compare what they were paid with the tonnage rates paid elsewhere. What they want is a system which will make them more certain that they are paid exactly what they earn, neither more nor less. The only objection offered by the operators concerned is the old stand-pat objection, that they "never have paid by weight *before;* why now?"

Taken together, these two demands mean simply that the movements in recent years for pure food laws and other regulations looking to more honest values, weights, and measures for the consumer, have a counterpart among this group of bituminous coal producers.

Second, claims are put forward by men in different mines that they have received little or nothing for "dead work," that is, for removing clay or slate, pumping water out of the mine, and other work which delays them in filling their wagons. Their contention was acknowledged by several operators to be true with respect to slate under six, eight, and in some cases, ten inches in thickness; but for removing slate thicker than that, each man is paid through an individual bargain with his foreman, and the employers say that they try to get "bosses" who will deal fairly with the workers. The men demanded that they be paid according to the Pittsburgh scale, which fixes a common "dead-work" rate definitely for all men for each contract period.

Third, the strikers asked for an eight-hour day, with the Pittsburgh district wage scale, for all inside men paid by the day. In addition to receiving slightly higher wages, day workers in the Pittsburgh district are on an eight-hour basis instead of a ten, as in Westmoreland. This two hours' margin is reduced, however, by a difference in the methods of reckoning when and where the work day begins. For instance, in the Pittsburgh district the work day for drivers is figured from the time they reach their places in the mines until they leave them again, while in most of the mines of Westmoreland county the time consumed in going to and from the stables to the mines, whatever the distance, is counted in the ten hours.

Finally, the men claimed that earnings for tonnage workers were lower than those in the Pittsburgh district. We talked with men who said they had been averaging about the same amount of coal daily for the last fifteen or twenty years, and although the rates of pay had increased occasionally, they held that their net earnings were less than in former years—at any rate that after they had met their everyday living expenses they had less left over than formerly.

Differences in mine and labor conditions (the hardness of the coal, thickness of veins, size of screens, etc.) and in methods of payment between the two districts make comparisons difficult; such data as are available, however, indicate that average earnings were lower in the strike district, but that the difference was not great. As to the trend of wages, neither the Keystone Company nor the Jamison Company could furnish figures extending back of 1904. A statement

from the latter shows the average daily earnings of its day men (drivers and mine laborers) to have increased 10.6 per cent from 1904 to 1909, the last year before the strike began. 1904, however, is probably not a fair year to reckon from;[1] the 1909 average was 4.4 per cent lower than that for 1906 and 5.9 per cent lower than that for 1907.

As for the real miners, those who dig the coal, the price per wagon was the same in 1909 as it was in 1904, while in the Pittsburgh district tonnage rates increased over five per cent in the same period. Even taking the earnings of the day men and the 10.6 per cent increase claimed since 1904, the raise in wages has not been enough to keep pace with what recent estimates show the increase in the cost of living to have been during the same period. Here we may account, at least to some extent, for the diminishing cash surplus which the miners have found in their pocketbooks after paying their living expenses.

So much for wages. Aside from them, unionism was stated by both strikers and operators as the issue. When the whole thing has simmered down, however, and the nature of the wage controversy is taken into account, something other than wages, as such, or unionism, as such, shows itself as underlying these two issues. The issue is unionism in so far as unionism means interference with the employers' absolute determination of the labor contract. The issue is wages in so far as the workers are not allowed to present any united front in demanding the things which affect wages up or down. But control is the word; the real question is one of industrial control. The workers ask some voice in their labor contract; and the operators insist that the decision shall rest entirely with them, except in so far as the bargaining ability of a miner, as an individual, may effect something. An illustration has been the operators' refusal to agree upon a schedule of specified rates for "dead work," and their insistence upon settling the matter directly with each man. As between foreman and individual miner, it is evident that the foreman is in the position of advantage. It means company control also when operators refuse to adopt a weight system enabling workers, through their own check-weighman, to be certain that their pay keeps pace with their work. The other two wage points, the eight-hour day and the Pittsburgh scale of prices, are phases of the control question, since consent to the miners' demands in these would mean that the operators were bargaining with the workers collectively, agreeing upon wage prices and conditions for a specified time. And such a collective bargain, as against company rulings, is again the rub.

Unionism crystallizes the issue even more clearly, in so far as the existence of any organization among the men would tend to even up permanently bargaining power of employer and employe. Thus, Edward Soppitt, general superintendent of the Jamison Company, echoed

[1] In the neighboring Pittsburgh district, wages in 1904 were lower than in 1903.

NOTICE

TO EMPLOYEES OF THE WESTMORELAND COAL COMPANY, AND TO ALL WHOM IT MAY CONCERN.

It has been stated in several newspapers, and also by various individuals, that the Westmoreland Coal Company has had a meeting with some of its former employees, or intends to have a meeting, after which, it has been stated, the Westmoreland Coal Company will sign what is known as the "Pittsburgh Scale."

THIS IS UNTRUE, and we wish to make this statement:—No officer of this Company has had, nor will have, a meeting with any of its former employees. This Company will not sign the Pittsburgh Scale, nor will it make any change in wages or working conditions. **ALL MEN WHO ARE NOW WORKING FOR THIS COMPANY WILL BE RETAINED AS LONG AS THEIR WORK AND CONDUCT ARE SATISFACTORY, AND WILL BE PROTECTED BY THE LAW FROM MOLESTATION.**

S. PEMBERTON HUTCHINSON, President.

A RECENT NOTICE POSTED IN WESTMORELAND COUNTY.

what the operators themselves have said: "This company will *not* recognize the union. We will deal with our own men as such, but will not deal with them as an organization."[1] John M. Jamison, president, said: "The companies object to any move to tie all the miners into one large organization. Our chief objection is on the point of the unions fixing wages." The fact that before the union was effectively organized twenty men were discharged by the Keystone Company for jointly criticising the operators shows the prevalent attitude toward any united resistance. Organized action, whatever the name it goes under, is objected to as infringing on the authority which the operators regard as inherent in the ownership of the mining property and necessary to its operation.

In the words of one official, the immigrant miners are like a lot of sheep and the United Mine Workers exploit them. Here's a clever man. He's district leader and has a lieutenant among the Slovaks, another among the Russians, another among the Italians, and so on. They follow. The companies' argument against what they decry as false leaders and a lawless association would have certain standing, if they could demonstrate that in past years their men have had ample channels for self-expression in matters affecting their work, and were secure in making any legitimate protest. With respect to the immigrant laborers, one operator stated that in their various national lodges the Slavs have organizations in which they discuss matters bearing on their work, and through which they can be said to make their wants known. They used to do this through the priests, but "now they've gotten away from them. It's a pity, too, for some were fine men, who helped the sick. Said President Hutchinson:

> We cannot recall any cases where our men have been dropped for proposals of any kind covering a wage dispute or change in labor conditions. While it is true that we have some instances of dissatisfaction for local grievances, such as crop up in any organization where such a diversified collection of different classes of workmen are employed, these cases are of a very trifling nature and the policy of our company has always been to investigate to the full extent of the complaint, giving the employe the benefit of all doubt and a respectful hearing. The policy of this company has been that all men who are in its employ are retained as long as their work and conduct are satisfactory.

In response to further inquiry, it developed that the channel for negotiations open to the men has been through the mine foreman; and that if dissatisfied with his decisions, they could take up questions with the superintendent or in turn with the general officers of the company. To the latter, this stated chance of appeal, coupled with the fact that for fifteen years there had been no strike in the district, seemed assurance enough that the rank and file were secure against any tyranny on the part of foremen and under-superintendents, and were sure of a fair hearing for any changes in work conditions which they might propose. Conditions in the different mines and companies of the district have varied considerably, so that general statements are difficult as to the actual working out of administrative policies. But the outstanding grievances put forward by the men, once they were out on strike and no longer within reach of discharge, are of too widespread and specific a nature to be viewed as the trumped up charges of a few agitators. If the channels of self-expression were there, the men very evidently had not had a working faith in them. The Jamison and Keystone companies advanced their tonnage rate 3.33 per cent in January, last, and 3.33 per cent on the first of April. The Westmoreland Company made no raise in January, but increased its rate 6.66 per cent on the later date.[2] But most of these advances came three months after the introduction of the safety appliances which, at least in their initial manipulation, it is admitted on all sides, reduced the earnings of the men. The burden incident to changing methods was on the men with the picks and not on stockholders or consumers of coal. And the more important advances came a month after the first meetings of protest were held,

[1] Soppitt himself is said to have been a former board member of the United Mine Workers!

[2] Eighty cents per ton of 2,000 pounds for coal passed over a three-quarter inch screen.

which had cost old employes of certain companies their jobs, after the early marches and demonstrations. For instance, there had been no announcement on the part of the Westmoreland Company that an advance was to be anticipated; so far as the men knew, it was not intended. So far as an outsider could see, it was not an automatic adjustment to keep wages abreast of rising costs of living, but a concession made under fire.[1]

It has been stated that while the interference of a hostile labor organization was resisted, the companies have been willing to meet committees of their own men. The treasurer of the Westmoreland Company, when asked, did not know of such a standing committee of the men in any shaft (like the "chapel' of a printing office), nor could he cite a specific instance in twenty years where a committee had been dealt with.

Since the outbreak of the strike, two communications from committees representing the strikers and labor leaders have been sent to the operators. They outlined the demands over which the strikers were willing to confer. These were ignored by the companies, their position in general being that their policy was to deal directly with their employes and only with them. It is clear, however, from what has been said, that the position taken was but a phase of a larger general policy to which the companies were committed, to be rid of any organization of their men, which would collectively have greater strength than the individual miner, and which to that extent would limit their complete control of industrial operations.

With their old men united and at loggerheads with them, have the companies been willing to condition their control even to the extent of putting the adjustment of the difficulty before a public body or group of non-participants?

On September 16 a committee of the Pittsburgh Chamber of Commerce, composed of F. R. Babcock, president of the chamber; H. D. W. English and Lee S. Smith, two ex-presidents; Enoch Rauh, and Samuel Ewart, addressed a letter to both operators and strikers which, among other things, said:

> Business men of the Greensburg-Irwin district, who have been greatly injured by the continuation of the strike, and having stated that they have exhausted their efforts for settlement, have called upon the undersigned, as business men of a neighboring community, which is also affected by the strike, to use their influence to endeavor to bring about a settlement of the existing strike.

The letter concluded by asking that both sides place before "an impartial, unprejudiced committee the differences which are yours."

The executive committee of the strike replied:

> We, the executive committee of the strike, desire to inform you gentlemen that we are and have been at all times agreeable to let the differences existing be referred to an impartial board to be arbitrated.

Replies from the Jamison, the Keystone, the Westmoreland, the Penn and the Manor companies September 17, 19, 20, are very well summed up in the following excerpt from the reply of John M. Jamison:

> We do not recognize differences which might exist between this company and strikers from other mines or districts, led by professional, salaried agitators, as proper subjects of arbitration. Such controversies, we firmly believe, deserve a different mode of treatment.
>
> The statement of facts herein set forth and the well-known policy of this company to deal directly with its own employes alone, in our judgment, leads irresistibly to the conclusion that there exist no such "differences" as require adjustment.

In its issue of October 1, the *Coal Trade Bulletin* printed an article bearing earmarks of a favorable bias toward the operators, in which it referred to the Chamber of Commerce committee as "butting in" on the controversy, and stamping their action as "presumptuous and officious."

Such is the status of things in Westmoreland county as this is written. Both sides are determined to keep up the fight. The mines of the county as a whole are not turning out over fifty per cent of their normal output. The larger companies, however, are the ones attempting to break the backbone of the strike, and claim a present production of seventy to

[1] The Westmoreland president states that his company decided to advance wages as of April 1, some time prior to that date.

eighty per cent normal. To an outsider they appear, with their political and traffic connections, a compact, resourceful group who since the early nineties have not had their own way disputed, and whose long and basic business operations in the district have established such ties of acquaintance and common interest, that their insurgent employes apparently find themselves tugging against the whole social fabric. The settlement of the strikes in Illinois and the Southwest, on the other hand, put practically the full membership of the United Mine Workers in other parts of the country back at work, and bring the national resources of the union up again to about $300,000 per month. Up to October 1, $125,000 had been sent into the Greensburg-Irwin district for the strikers and their families, and plans were being laid for the construction of temporary houses to take the place of the tents in cold weather.

So far as the state of Pennsylvania and the public are concerned, the result of the conflict is left to a test of strength between these opposing forces.[1] We have seen at what cost to Americanism and good feeling and physical well-being it is proceeding. Some of the stories of brutality, as told on both sides, are apparently gross exaggerations. The residue, fairly substantiated, is a disgrace.

[1] During the fall, there has been a factional fight waged against President Francis Feehan, who comes up for re-election before District Number 5, United Mine Workers of America in December. Like everything else in Pennsylvania, it ramified into the recent political campaign (Feehan being charged with making a deal with the Penrose machine). It is further complicated by the activity of the old adherents of the late Pat Dolan, whom he ousted from the leadership, and by the current feud between Feehan and President Lewis of the national organization. The Westmoreland operators charge that Feehan instigated the strike in their territory, not in the interest of their men, but to advance his personal fortunes. In a recent issue (Nov. 11), the *Labor World* published an affidavit from "Sam Bernardo" who swore that John H. Jones, president of the Pittsburgh-Buffalo Coal Company, had attempted to hire him to help organize the Westmoreland field. Jones, himself a miner in the early days, is a relative of Feehan and is today a large competitor of the Westmoreland companies. The officers of District No. 5 have replied with a statement (Nov. 23), that attempts were made to bribe them, and have them "betray the striking mine workers," and that when these were rejected, they were told that "large sums of money would be expended to discredit us and drive us from the organization ruined." The disinterestedness of the charges made by the *Labor World*, which purports to be a union paper and the champion of the anti-Feehan faction, is discounted by the presence of display advertising, in adjoining columns, of the Jamison Coal and Coke Company and the Keystone Coal and Coke Company.

Taken at their best, the union officials feel that they are contributing leadership and knowledge of organization and backing to a great group of fellow workingmen, who for almost a generation have been held in the grip of an unexampled industrial tyranny in this hill district. They assert that on every occasion they have counseled the men to be law abiding, and to be on guard against both their own quick impulses as aliens, who cannot see that our laws are giving them justice, and against the schemes of opponents who, they say, seek to discredit the men by provoking them into disorderly conduct.

Taken at their best, the coal operators feel that they are the administrators of vast properties, which they cannot manage responsibly if either their men or outsiders interfere, and which they believe they are running not only in their own best interest, but in fairness to their employes. They assert that they have fought the strike through the law, in engaging the deputy sheriffs, in securing injunctions against marches and camps, and in evicting strikers' families from company houses; and that in so far as strikers have violated those injunctions, they have brought the results on themselves.[1]

At their worst, the union leaders have been charged with inciting the men to the use of force against the companies and the strike-breakers.

At their worst, the operators have been charged with directing the deputies to do the mauling and killing which are laid at their door.

There is no evidence available to support either one charge or the other. We have met men on both sides who are not at all of that stamp. But one fundamental distinction should be pointed out. Responsibility for the violence which occurred up to the time of negotiations for a settlement of the strike may well be debatable ground. Since the companies, however, flatly refused to meet the men's committee, or to submit the issues at stake to an outside body, it would seem

[1] From the letter of an operator: "I am willing to accept the responsibility incurred by taking legal measures to preserve our rights. If people get hurt when they come in contact with the forces of the law, they have only themselves to thank."

that they cannot escape bearing a special responsibility toward all violence subsequent to their refusal.

The social machinery of Western Pennsylvania has broken down in the face of this industrial conflict. In the words of an operator, a state of lawlessness exists. As remedies he proposed: (1) That the law which governs in two counties of the state (Allegheny and Philadelphia) should be extended to all; namely, that in case of riot the county should have to make good any property destroyed; this would hold up local authorities to their responsibilities for law and order; and (2) that there should be a state police, numerous enough to protect a district on strike, with disciplined men. "We pay $100,000 taxes to the state of Pennsylvania," he said, "yet we haven't mined a ton of coal since April except under armed guards whom we have had to pay for." Given protection, he had no doubt that he could secure men at his own terms (which he considered fair) to operate the mines.

But the miners, their families and the public have suffered as much as the operators from the lack of more enlightened legal recourse than industrial war as a means for securing justice. It is doubtful if they would regard the proposals mentioned as a sufficient rehabilitation of the social machinery. The public has been sorely in need of some agency which could thoroughly overhaul the facts of the strike and learn the real causes of so much disturbance and loss of business. Then it could throw its influence toward a settlement with intelligence. Nor has the state government sent a troop of police clattering up to the mine pits demanding that the check weighman's law be carried out. For while the five different varieties of peace officers which the operators have mustered to the protection of their interests, when threatened, have been many of them weak reeds to depend upon in a crisis, the men have had in the past no agency at all through which they could take up for settlement issues which threatened the livelihood, not of one or two, but of all in common, short of this concerted cessation of work, which has dislocated the whole scheme of life and industry in Westmoreland county.

Steps to meet such needs, either in behalf of public or of wage-earners, would inevitably run counter to the principle of complete control of their property which the operators claim as a right and a necessity.

S. Pemberton Hutchinson succeeded to the head of the Westmoreland Company, the largest operators in the region, on the death of its president in July. Therefore, he was not involved directly as an executive in the earlier events of the strike or in the causes which led to it. So he is in a position to state the policy of his company as to control, altogether free of the entanglements and personal issues which are bound to crop out in the course of a prolonged industrial conflict.

In an interview he put the thing in a nut shell,—"We want to run our own business our own way."

THE GRAVE OF PAUL RENOMENO WHICH OVERLOOKS YUKON.

With respect to the public (in connection with the offers of conciliation or arbitration), he said, "We don't want to have outside parties conduct our business for us."

With respect to his employes, "We ask no man whether he is a member of a union or not. We offer a certain rate of wages and certain working conditions. Anybody has the right to accept or to reject them."

THE HOUSING AWAKENING[1]

II

SOCIALISTS AND SLUMS—MILWAUKEE

CARL D. THOMPSON

CITY CLERK OF MILWAUKEE

"Milwaukee is essentially a 'city of homes.' The percentage of laboring people who own their homes exceeds that of any other city in the union. It has no congested slums or tenement districts."

This is the statement made in a prospectus issued by the Merchants and Manufacturers' Association of Milwaukee, published of course in the interests of "civic pride," attracting capital, booming the city, the greater Milwaukee, and other similar commercial ideas.

How naively innocent. Or shall we say, how adroitly misleading.

Of what city on all the American continent can it be said, "It is a city of homes?" Homes for whom? What kind of homes? Who owns them?

These are questions which no commercial association, we fear, would answer frankly and fully. In this respect Milwaukee is probably no worse and no better than the average city of its size.

FACING THE FACTS

A new administration has come into power in Milwaukee. It views social and industrial problems from a new angle; grapples them with refreshing vigor and originality—among these none is more interesting than the housing problem—and at the outset refuses to be misled as to the facts or to conceal or mistake the facts in the interests of a false commercial pride.

It may be accepted as practically true that there are as yet no extreme tenement or slum districts in Milwaukee, at least none of the kind which we have in New York and Chicago. But we do have in Milwaukee three foci of the disease. One is in the third ward, the Italian district, where living conditions are perhaps worst; another is in the fourteenth ward, where the Polish working class lives; and the third is in the Jewish district in the fourth ward.

The administration is determined to prevent these foci from developing and especially from coalescing. Milwaukee is a comparatively small and relatively young city. Conditions have not developed so far as in larger cities. It is possible to prevent the growth of real tenement conditions and of a slum population. It is the resolute purpose of the present administration to prevent it if possible. It hopes that Milwaukee will never have the kind of problem which New York city, Chicago and other like cities have.

But while Milwaukee does not have real tenement houses or slum districts, it does have practically the same conditions as are found in the slums and tenement districts of larger cities. H. H. Jacobs, warden of the University Settlement, who is as familiar as anyone in the city with its housing conditions, puts

[1]For the opening article in this series see The Housing Awakening, by Lawrence Veiller, in THE SURVEY for November 19. Price 10 cents.

THE MILWAUKEE OF TODAY.

Typical of several sections to which Mr. Thompson applies a term usually confined to larger centers—"the city wilderness."

it this way, "What we have in Milwaukee is tenement and slum conditions in the cottage dwellings of the city."

When some of the newspaper men and charity workers of the city were taking Mr. Veiller on a tour of inspection through the fourth ward Ghetto, and again through the Italian quarter of the third ward, he told us that he had never seen anything worse in New York or Chicago than he saw in certain individual cases here and there in the housing conditions of Milwaukee. This opinion was supported by other experts, and from such knowledge as I have of housing conditions in the various cities, I am of the opinion that it is true.

In the third ward bad conditions are not quite so extensive, but more acute. On one of our trips of inspection through the Italian district, we came upon conditions which words cannot describe adequately and no camera can picture. Sounds and smells escape the camera.

Entering one of these dwellings we had to duck our heads to escape a shower bath from leaking pipes above the door. Incidentally, we had to dodge a crowd of the canine family which did not seem to be particularly pleased with our visit. The rooms were dark. Something, which I supposed was food or intended for food, was bubbling on a little stove. A friendly goat was playing with the baby on the floor, and the pigeons cooed cheerily nearby. Through the door of the kitchen we got the odor of the stable. The horses had the best room. In the middle room, which was absolutely dark, on a bed of indescribable filth, lay an aged woman, groaning with pain from what I judged to be ulcerated teeth, but which for aught she knew might have been a more malignant disease. In this single dwelling, which is not unlike many we saw, there lived together in ignorant misery one man, two women, ten children, six dogs, two goats, five pigeons, two horses, and other animal life which escaped our hurried observation.

The most insanitary conditions prevail in the basement dwellings. It is not infrequent to find conditions where ten men live in a basement. In the alleys accumulate the dirt and filth typical of tenement districts. Often there is a box of manure under a kitchen window, and the refuse and garbage

THE MILWAUKEE OF TOMORROW.

Suburban property, twenty minutes by trolley from the heart of the city, which the socialist city government will plat for workingmen's homes.

piled in a foul-smelling mass where the little children must live and play.

In the fourth ward the alleys are crowded with shabby shacks, shut out from sunlight and air by dead walls of larger buildings, forlorn and wretched.

In the Ghetto, in one building live seventy-one people, representing seventeen families. The toilets in the yard freeze in winter and are clogged in summer. The overcrowding here is fearful and the filth defies description.

Within the same block are crowded a number of tenements three and four stories high with basement dwellings. One of these is used as a Jewish synagogue. Above and beneath and to the rear this building is crowded with tenement dwellers. The stairways are rickety, the rooms filthy, and all are overcrowded. The toilets for the whole population are in the cellar adjoining some dwelling rooms, reached by a short stairway. At the time of our visit the floors of this toilet, both inside and outside, were covered with human excrement and refuse to a depth of eight to twelve inches. Into this den of horrors all the population, male and female, had to go.

Just back of this synagogue, and on all sides of it, the overcrowding is tremendous. A glance at the pictures showing the rear of these buildings will prove conclusively that to all intents and purposes we have regular tenement dwellings in Milwaukee.

Another feature of the overcrowding is the back to back cottage and tenement dwelling. It is not unusual to find three houses on one lot with very little breathing space between.

Here one sees the "sanitary" bakery wagon, whose driver, after tramping about in the offal of the alley, climbs into the wagon with his dirty boots, and then piles the loaves of bread where his feet have trod.

Here the children's only playground is the street or alley. The child digs up the manure with a broken shingle, to load it in his little cart; here the little child-mothers bear the burdens left upon them by their elders, who have gone away to work.

Thus we have all of the conditions of a tenement and slum population: the dark rooms, the overcrowding, the filth, the insanitary toilets—none of the horrors, none of the dangers is missing.

These have but to be allowed to breed,

HIS ONLY PLAYGROUND THE ALLEY.
"The child digs up the manure with a broken shingle to load into his cart."

to fester, to spread, and with the growth of the city, our housing conditions will become, in proportion to our population, as bad as those in any city.

"THE CITY WILDERNESS"

From the window of one of our public schools in the Polish district in the fourteenth ward on the south side, one can get a striking view of "the city wilderness." The gabled roofs of a vast stretch of houses peak upward with the monotony of waves, and stretch away into the gray distance until they are lost in the smoke of the factories which fill in the background. These are the "homes" of the Polish people who toil. A picture merely suggests the monotony and the magnitude of the problem.

If we come nearer to these houses, almost any one of them, we shall find the typical dwelling. There is an entrance, perhaps under the steps, which leads to the apartments below. In this semi-basement in the front lives a family. There are perhaps two rooms, sometimes only one. In the rear of this same basement lives another family. Above, on the first floor, lives another family, likewise in two or three small rooms; and in the rear is another. Thus four or more families live in one small cottage—and, often, in true tenement style, they "take in" boarders.

To make matters worse, crowded back to back with these dwellings are the alley houses, mere duplicates in construction and crowding.

All of these houses are crowded closely together, so that there is very little, and in many cases absolutely no sunlight in the dwelling rooms. Here, together, live men, women, children, dogs, pigeons and goats in regular tenement and slum conditions. This is another of the three foci of the Milwaukee housing problem.

In some larger American cities less than one-tenth of the people own their home. In Milwaukee, a city where capitalism is less developed, the percentage is higher—35.1. But how can it be said even of such a city, "It is a city of homes"? Only a trifle over one-third of the people have a place which they can call their own.

Nor is it true that the percentage of laboring people who own their homes "exceeds that of any other city in the union." In Milwaukee the percentage is 35.1, while in Cleveland it is 37.4 and in Detroit 39.1. So the boast of the Merchants and Manufacturers' Association is without foundation. Only a trifle over one-third of our people own their homes at all, and with that the administration is heartily unsatisfied. Moreover, conditions are sure to get steadily worse as the city grows unless active measures for improvement are begun.

HEALTH DEPARTMENT AT WORK

The first task in the solution of the housing problem is diagnosis of the case. For that sort of process a physician is

needed. So, naturally, this part of the work falls to the Health Department. Hence for this, as well as for other good and sufficient reasons, the Milwaukee administration was particularly anxious to secure an especially competent health commissioner. Those who had the matter in hand for the administration sought diligently far and wide. They went to Rochester and tried to get Dr. Goler. They went to Chicago and other cities. Meanwhile objection was steadily made against the appointment of anyone outside the city on the ground that it was contrary to civil service and state laws. At last the administration hit upon the idea of securing Dr. William Colby Rucker, who technically was a resident of Milwaukee, although as a matter of fact his work in the army and navy had kept him away for many years.

The administration learned of Dr. Rucker's remarkable success in dealing with yellow fever in New Orleans and bubonic plague in San Francisco. He seemed unquestionably the man who would fill the bill. Some question was raised as to his politics. The reply which Mr. Berger made was characteristic. He said Dr. Rucker's politics were "anti-bubonic plague, anti-typhoid fever, anti-slum and anti-rat." That sufficiently illustrates the view of the administration and its attitude towards politics. Efficiency comes first, in its judgment.

However, Dr. Rucker's superior officers were unwilling to let him go. The administration moved on Washington and through the Wisconsin representative secured from President Taft a leave of absence for Dr. Rucker, in order that he might take up the work.

Once at the head of the Health Department, Dr. Rucker's attack upon the various phases of the housing problem was immediate and aggressive. He began at once a general clean-up in the streets and alleys, the byways and basement dwellings, as well as in general housing conditions in the Ghetto. Two hundred boys and girls were organized into the Milwaukee Health Guards, whose purpose is to help keep the city clean, to spread the idea that the preservation of human life is the highest type of patriotism. An investigation of the tenements was begun and a system introduced for scoring houses as to their relative sanitary condition. An immediate reduction of the number of occupants was enforced in the tenements where there was

THE SLUM IN MILWAUKEE.

To all intents and purposes a tenement, with all a tenement's bad features.

JEWISH SYNAGOGUE.
Crowded by tenement dwellers above, beneath some of the worst conditions ever encountered.

serious overcrowding. An educational campaign was begun by means of popular lectures on sanitation, for the general public. They were illustrated with stereopticon slides. An ordinance was sent to the City Council providing for the removal of slaughter houses from the city, thus doing away with some of the most distressing conditions in one residence district. The garbage collection department was reorganized so that garbage is collected between midnight and six in the morning instead of during the day. Modern tight-lidded metal receptacles were substituted for the old-fashioned garbage box or barrel. And, finally, a commission was put to work to devise an up-to-date system for disposing of sewage. At present it is emptied into the lake from which the city draws its drinking water—and typhoid fever is much more prevalent than it should be, an epidemic occurring in the early part of the year.

Now all these activities of the Health Department bear either directly or indirectly upon the housing problem and the administration proposes to bring every possible force into play in behalf of better living conditions.

OTHER PROBLEMS INVOLVED

But something more than this is required in dealing with the housing problem if anything like a solution is to be reached; some method must be found to provide the people with better houses, at such rents as will bring them within the reach of the poor. More than that, they must be so located that those who work in the industrial centers may pass quickly back and forth between their homes and their places of work.

Thus the problem involves the city at once in at least three other problems, namely, municipal dwellings or some similar arrangement, city planning and platting, and transportation.

The Legislature had granted Milwaukee, under a law relative to parking, the right to buy, own and sell real estate. By means of this, the administration is taking steps which will put the city in

MANURE BOX UNDER A KITCHEN WINDOW.

JUST BACK OF THE SYNAGOGUE.

"What we have in Milwaukee is tenement and slum conditions in the cottage dwellings."

possession of nearly a million dollars' worth of real estate on the outskirts of the city. The land is being platted with reference to model dwellings for wage-earners. Certain sections are to be set aside for industrial and manufacturing purposes. Other sections will be devoted to commercial interests, and still others will be reserved entirely for residences.

As most of this land bears trees and shrubbery, and some of it lies very beautifully on the banks of the rivers which flow through the center of the city, it forms an almost ideal place for residence. Literally miles of beautiful, rolling land on the banks of the rivers, with here and there the beckoning glory of the woods, and now and then a suggestion of the forest primeval, lie within a twenty-minute street car ride from the heart of the city. A more ideal place for the dwelling of man could hardly be imagined, yet these broad smiling acres lie untouched while the people stifle and sicken in the city less than three miles away.

Solve the problem of cheap and rapid transportation, and the working people may live by the rivers, amid sunshine and shade, the melody and song of nature's open fields. This the administration is determined to bring about. It is the purpose so to plat these residence districts that every house will have land enough to let the sunlight into every room and to provide for garden and lawn.

As to the houses themselves, Thomas A. Edison has become so interested in the plan that he has offered to give the city the use of a new method of concrete construction, by which houses that formerly cost several thousands of dollars can be built for something like eight hundred.

A form of lease will be offered to working people, which will enable them, by payment of a very small sum, to secure possession of a little plot of ground and a dwelling. Further payments will be on easy terms and the arrangement will carry a surrender value, so that at any time any workingman who takes advantage of the offer will be able to get back the money he has put in.

The administration believes that the offer of homes under such conditions will prove so attractive, that very soon the tide of population will be turned back from the congested center and spread out over the wider area.

But even this plan will fail unless the city can manage to keep control of the transportation problem, for as the population spreads out the need for quick, cheap travel increases.

CHEAP RAPID TRANSIT

Therefore, as part of the solution of the housing problem, the Milwaukee administration is wrestling most earnestly with transportation. It has already drafted a model franchise with considerable show of being able to put it into operation. If it succeeds in this an entirely new system of transportation will gradually be developed within the city. A number of interurban lines are already eager to accept any reasonable terms that the city may exact in order to develop their systems into and within the city. The plan is to have trunk lines under complete control of the city from the beginning and the franchise terms provide that the city automatically becomes the owner. These lines are to be direct from the heart of the city to the outlying districts. They are to be of modern construction and with universal exchange of tickets and transfers, so that one unified system will be put into operation. The rates are to be under city control and the whole system will ultimately be owned by the municipality.

In this way, by securing at once the control of the developing system and by providing for final municipal ownership of the whole system, the city will be in a position to keep its outlying residence districts within easy reach of all who wish to use them.

STABLES AND MANURE PILES FOR NEIGHBORS.

A QUESTION OF WAGES ALSO

Finally, those who are struggling to free themselves from bad housing conditions must be assured of an income which will enable them to meet expenses. No one can get something for nothing, and it is not the purpose of the administration to pauperize its people by charity. The effort is, rather, to enable the people to help themselves. The housing problem, therefore, becomes a labor problem—a question of providing the people with steady employment at remunerative wages. It is fundamentally a question of wages and hours, of labor and cost of living.

A WOODEN TENEMENT.

Seventeen families, numbering seventy-one people, live here.

CITY GARBAGE WAGON AND HOME OF ITS DRIVER.

One woman, ten children, six dogs, two goats and two horses live on the lower floor; more people live upstairs.

"WANTED—A PLAYGROUND."

The poor and ignorant classes of working people, who are attracted to this country by the commercial interests, which are always seeking cheap labor, cannot extricate themselves so long as the labor conditions which they now encounter prevail. The Italian, the Slovac, the Hungarian, the Pole, the Jew and others who are brought into our cities by commercial interests, are those who suffer most from bad housing. The sooner it is clearly understood that the reason they suffer thus is because they are poor and ignorant, and because their wages are low, the sooner we shall see the solution of the housing problem.

These foreigners are brought here because they will work for low wages. Because they work for low wages they must live in wretched and insanitary houses and hovels. And because they live thus the city has the menace of the tenement and the slum. There is no final escape for them except by way of improved labor conditions. Hundreds of cities in Europe have tried to solve the tenement and slum problem in some other way. There is no other way. The cities which have torn down their slums and built model tenements have discovered finally that the net result was that the slum and tenement appeared in some other place. Better educated and better paid people, generally the middle class and always those who had some degree of economic resource, were the ones who moved out into model dwellings. The others could not—they did not have the means.

So, ultimately, the effort to solve the housing problem must fail until it reaches down to the economic basis of life. It must open opportunities for labor at increased rates and under better conditions. It must increase the economic efficiency of the lowest strata of the toiling population. It must do this or it cannot bring them out of the bondage of their tenement dwellings.

UNDERGROUND DWELLINGS—THE CITY HAS RISEN AND FORGOTTEN THEM.

THE INTERLAKEN CAMP.
Showing a few of the twenty-eight tents in the woods.

THE SCHOOL AT INTERLAKEN

CHARLES H. CHARLTON

Profoundly believing that our schools are out of touch with the realities of life, Edward A. Rumely, a business man of Laporte, Ind., has founded the school at Interlaken. He has patterned somewhat after the homely simplicity of the new schools of England and Germany, yet he is building a school that is thoroughly American—a school that through actual work as well as through study in classroom shall really prepare for practical life. And he believes that vocational training should be an essential feature of education. It is his purpose to create a model school that will demonstrate such a course of studies for children from the eighth to the eighteenth year. His program is ambitious, for he intends that Interlaken shall work out problems in a way that will be useful to our whole public school system.

Here, first, is his statement of our national need of industrial education, as he expressed it before the convention of the National Education Association:

> No one sees more plainly than the manufacturer that the future of the American republic depends upon the school. And he asks this question:
>
> "How can this school, which is giving immediate shape to the nation of the future, give our boys and girls a training that will be efficient preparation for the practical work of life, which is also the work of the nation? In spite of 150 years of earnest effort, the school still clearly favors the few who have no other aim than to be clerks in stores, banks and offices, and the fewer who take courses leading to the professions. But it neglects the ninety boys out of every hundred who are to do manual work as machinists, carpenters, printers, telegraphers; the girls who are to be milliners, dressmakers, housewives,—the thousand sorts of breadwinners. How shall the future give them their training?"
>
> Our educational progress has not kept step with the wonderful advance of the world. By practical standards the school has changed little within the last century, while our civil-

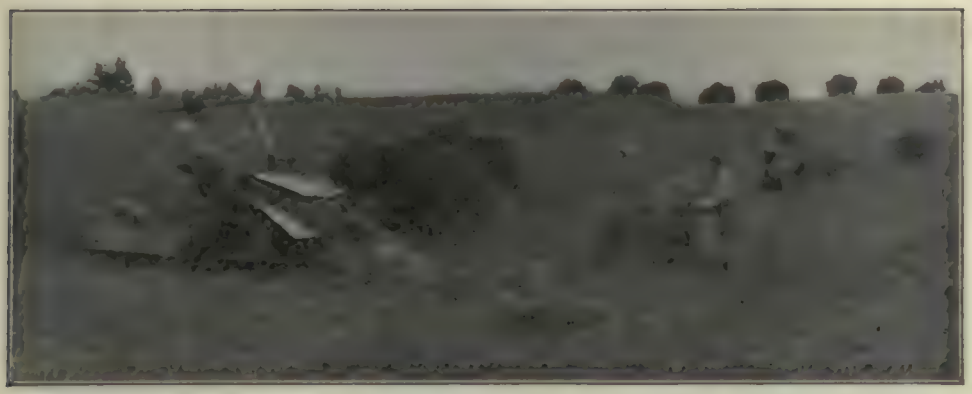
Picking a mess of early beans for ninety boys.



ization has been magically transformed from primitive-rural to complex-urban. The age of universal transportation has arrived, and has suddenly made the world small, until remote nations seem next door neighbors. We are now conscious of the swarming tumult of men on the globe, with whom our human relations have multiplied enormously. The small tool of the worker has given way to the vast machines of the factory and the labor-saving implements of the farm. The automobile, the bicycle, the telegraph, the telephone, the typewriter, the phonograph, the motor engine, with its thousand uses, enter into the daily routine of our lives. All life has come to depend upon mechanical marvels, and its pace has been keyed to wonderful swiftness.

We must adapt the immense new experiences of the world to the educational needs of the future. As an industrial people we must see that skill goes with schooling. Practical work in the school must prepare for practical life. Our children must learn to conserve, if possible to increase, our store of natural resources. Think of our pressing need!

We have become a spendthrift race. Extravagance is the order of the day. James J. Hill told us the other morning that our trouble is not the high cost of living, but the cost of high living—privately and publicly the wild waste of natural resources. Four generations ago our forefathers had to their west a vast untouched continent, rich in timber, ores and soil fertility beyond anything the white man had ever found. The entire population of the country, scattered along the Atlantic seaboard, was limited to a couple of million people. These natural resources were successfully exploited, our wealth increased as if by magic, and today our population of ninety millions has occupied the whole continent, from ocean to ocean, but not without leaving its mark upon the land. Our forests, laid low by giant mills, are more than half cut. Our streams and lakes have been looted of their fish by water-wheels and steam-drawn seines. Our mines of ores and coal are beginning to show signs of depletion. Our soil, with impaired fertility, now yields eighteen and twenty bushels in place of the forty of the virgin prairies. At the end of it all, we are beginning to see that our national wealth is not all the product of wise and intelligent labor. Largely, we have done no more than transmute, and often recklessly, our natural resources into the uses, ornaments, extravagances of our civilization; railroads, foodstuffs, clothes, palaces, monuments, elegances of living, lavish show of gold and silver.

The machinery of plunder has been tremendously developed. By its use we have been able to export enormous quantities of raw material and the bounteous products of our fields Now, however, our agricultural exports are falling, and the time is already at hand when we shall need our own foodstuffs to feed an increased population. It will soon become an actual question of food. Most of the original natural wealth of the land is gone, and every child born in the world brings into it the mouth of a consumer, but no natural wealth, except the labor power of its two hands. Life, henceforth, must be supported by high intelligence, skill of hand, the honest work of men, and not by systematic robbery of nature. Henceforth, we must export neither our raw materials nor our foodstuffs, sacrificing to other nations the riches of our soil. For the future, we must export the factory value of the skilled work of our hands, which can create wealth of all kinds. For the future, the annual per capita value of our manufactured products must show a steady rise from the present estimated standard of $74.53.

Germany says consciously to herself: "Skilled workers produce high values. Unskilled workers do not. The hewers of wood and drawers of water are dull peasant types. The men of directive power who lead the world come from the skilled classes. Let us save our own natural resources, and get from other nations our raw materials, and

HARVESTING TIME
Boys working with the farmer cutting and binding the wheat.

the rough manual labor that produces them."

Such competition as this will force us to become predominantly a manufacturing and industrial people, a course upon which we have started and made astonishing progress. We have perhaps 4,000,000 skilled workers, perhaps 3,500,000 unskilled workers. While we can get our unskilled labor abroad, it is of huge importance that as many as possible of our own citizens become skilled workers, and so creators by their toil of products of high values. Considering material advantage alone, the annual money difference to the nation, whether the ninety per cent of our million boys who will leave school next year become skilled or unskilled workers reaches a prodigious total of hundreds of millions of dollars

If we are to maintain our present position among the nations, the masses of this country must excel by their superior skill as workmen. For we shall be obliged to meet, at first in the world's markets and later at home, the products of Germany and Japan, our ascendant modern nations, crowded throughout with a surplus of skilled and efficient labor. We cannot compete with them through raw materials and a low cost of living, which are things of the past in the United States. We can meet them only by the superior skill and better training of masses of American workmen. Where are they?

It is a curious thing, as Mr. Roosevelt has said, that in industrial training, we have tended to devote our energies to producing high grade men at the top rather than in the ranks. Our engineering schools compare favorably with the best in Europe, whereas we have done almost nothing to equip the private soldiers of the industrial army—the mechanic, the metal worker, the carpenter. Indeed, too often our schools train away from the shop and the forge.

Great branches of our industries have been built up to their present prosperity by the educational foresight of Germany, by her skilled mechanics, trained in her splendid technical and trade schools; but today there is a serious dearth of skilled industrial workers, and we cannot longer depend upon other nations for such supplies of trained men. A carpenter's bench and lathe—the manual training that is being enthusiastically given everywhere, does not solve the problem. And no other sources of supply are discoverable. The old apprenticeship system has almost entirely disappeared, leaving, at the best, substitutes that supply only individual needs. In all our crowded cities the sons of skilled workers are going in extraordinary numbers into box factories, candy factories—a hundred unskilled trades—hopeless of earning high wages or developing high efficiency. Yet competent mechanics are needed in every branch of our industry, from a pin factory to a giant automobile plant.

All this defines one side of our need for effective industrial education. But there is another view of the question, which is equally important. For the training of manual work, the keen discipline of learning any one of the skilled trades is the schooling that is needed by all boys, not only because it is going to make efficient men of them, but because it is a necessity to their bodies, that are fifty-two per cent muscle. This can now only be got through the school, yet from the school until now we have had the one-sided mental training, which physicians are beginning to understand is the first great cause of the widespread nervous troubles of today—a thing so exclusive to our own land that our prevailing form of nervous disease is, in Europe, called "Americanitis." From such diseases we shall suffer more and more until the school gives our children strong trained bodies and practical well trained minds.

Until a few years ago the work of everyday life at home made special muscular training unnecessary. Industry was centered in the home, where they used to grow their own food, spin and weave their own cloth, make their soap, dip candles. Eighty per cent of the population was agricultural. The father, if he happened to be a cabinet maker or blacksmith, shaped his wood and forged his metal

near his home, within sight of his children. Each child was called upon while still young to share the parent's activity. He gained not only an insight into the industrial processes, but he acquired habits of work, keen discipline, moral training for his future occupation.

But now we are become a new sort of cave dweller. Even in our suburban homes we have accepted the automatic ways of apartment house life; luxury, indulgence, ease are softening our fiber, and industry has passed forever from the home to the factory. This has thrown new duties upon the school. Fifty years ago the academy boy was an efficient and intelligent part of that mid-century civilization. The entire industrial process was known to him. Today, through the enormous complexity of life and its minute specialization in work, this has so far been lost that the city high school boy has not even the elements of knowledge sufficient to build up imaginatively the vital facts of daily life and labor. He has studied books and heard things talked about, but even of his father's productive work he has had little or no share. Chalk and blackboard and books, even when supplemented by our new manual training, are no longer enough.

Our new civilization has its own vital needs. The knowledge necessary for use in the productive industrial processes has increased enormously. Sciences, like physics and chemistry and electricity, have become vital factors in the daily work of the world. The tempering of steel formerly meant no more than the heating of the metal to cherry red; it is now an intricate process requiring a difficult study of temperatures and alloys. And today skill and accurate knowledge in the use of the hands are needed as never before. Clearly, we must immediately have a new school, for children now need the training of their muscles as well as of their minds. And they need the training of their minds through their muscles. Without such training our race will lose in vigor and fall into decadence. The second and third generations of city-bred men, in the past, have always shown a weakling strain. Under stress of twentieth century life, unless a remedy be found, degeneration will be still more rapid.

THE DUTCH DINING ROOM.
Built, finished and furnished by the boys.

These are the needs that the failure of our schools is clearly pointing out. And this is why Interlaken was built, and why it has had such a rapid success.

The school is on Silver lake, one of the wooded lakes of northern Indiana, and looks out over the pleasant, low rolling corn land that the Jesuit explorers called La Porte—the Door of the Prairies. On

GETTING IN THE HAY CROP
Within a fortnight the boys cut and stacked eighty tons of hay.

its immediate west, beyond its grove of oaks, lies the broad band of country which skirts the southern shore of Lake Michigan, and which with its roaring factories and foundries and spreading cities is already called "The Industrial Center of the United States." In its beginning, three years ago, Interlaken was but a great, square brick house of the seventies, vine-covered, mansarded and iron-trimmed. And from this comfortable old mansion, as from a center, the school grew—grew naturally, like the thing of life it was meant to be. Boys came in companies; halls were added, each a home, framing its own habits, building its own character. And naturally, too, developed the generous democracy of its government and the widening scheme of work.

A place of hearty ways and no formality; a school free from formulas and from catchword texts. Yet over the great door there stands the frank greeting: "A welcome to all who mean to work."

And within the hallway on the face of the carved mail-box, below the two hemispheres and their winged Mercuries, run the words: "See how by working together men have brought the whole world within your reach."

There you have declared, in honest introduction, the whole method of Interlaken—earnest, co-operative work and helpful fellowship. By the custom of the place, even the visitor "lends a hand", according to his talents, when he comes to stay with these 120 lads—some nine years old, some ten, some twenty, but most of them high school boys between fourteen and eighteen—most of them the sons of business and professional men. Here the moral, social, industrial sides of education become as important as the intellectual and physical. The monthly reports to parents are not tabled marks, detailing, in percentages, only the student side of the boy's life, but candid letters telling the essential facts of his entire growth. The school is concerned with the whole boy, and not merely with a part of him. Here education is life, made up of realities. It has to do with the real work of the world; and the boys have about them men, and the fine healthy roughness of men. They are always ready for life, because they have always been a part of it.

And so at Interlaken, beginning with the simplest things, the students are soon made familiar with the primitive arts. About the farm, in the stable, they learn nature's lessons in facts that have to do with human living—the care of animals, the growing of crops. Every part of the school is open to them: the office a working department of business and commerce; and here, above all, interest must not be idle; even the kitchen, in face of the wrath of the first cook of their tradition, where time is valuably spent helping and watching a hundred things besides the making of wholesome bread.

In the shops every article is made, not aimlessly, like the bread-boards of many

LETTING LIGHT INTO AN OLD FARM HOUSE.

schools, but to meet a definite need. Nor is there dawdling in the work; because other business is urgent, and there is only time enough to do each job well. The boys not only make chairs, tables, bookcases for their own rooms and to send home; they do craft work in wood and metal to sell. And here the spur of the practical outside world strikes the school. The product of their copper work has reached a standard of such salable excellence that Marshall Field's of Chicago, this past year, bought all their surplus manufacture.

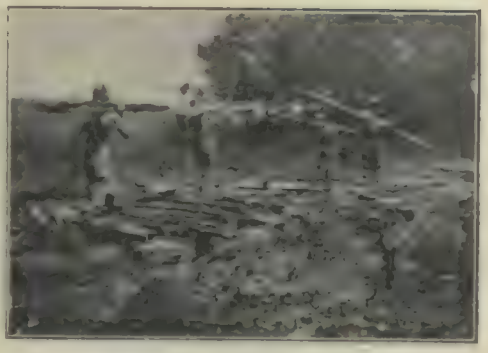
Then, too, the school always has work of its own to be done—always pressing work. It may be shaping shelves; running a fence, straight as a surveyor's line; building a windmill; fitting rubbers to chair legs; framing another beehive; or that ancient sort of manual training, that is chores. And the boys undertake ambitious things. Here is one of many taken from the school's history:

At the end of the first year every room was taken and new accommodations had to be provided. The boys were called together for a talk about plans to meet the growth of the school. Among other things it was then decided that they should build an extension to the dining room. In the early morning the headmaster drove two stakes. By the help of the instructor in carpentry the boys had made all their measurements and completed their sketches by noon. By night their plans were finished. The next morning active work began, and until it was done only one man shared their labors. They have never forgotten how to mix concrete, for they had to travel a mile to town to find out the proper proportions of sand and cement and broken stone. They learned the principle of reinforced concrete and they bought the rail they needed from the railroad company. They put up the frame, carefully nailed on the siding, tarred the roof, plastered the walls. They fitted the trim, did the painting, and, with the aid of the art instructor, cut the stencils and decorated the interior They made and finished the old-fashioned double-decked tables and the benches. An eighteen by twenty-four two-story extension built by ten boys within five weeks?

Boys who are to undertake directive work must become interested early in the work of their fathers — the real work of the nation. To help them in this, the practical work is brought constantly into the school. Business men help in its direction, and visit it frequently. The daily papers and the magazines are publicly read for their vital news of progress and achievement. The responsibilities and the opportunities of American life are made forever present. John A. Secor, the inventor, lived with the boys at Interlaken last year. They witnessed step by step the building of his new internal combustion engine, which explodes kerosene as a gasoline engine explodes gasoline. They saw its first successful test, and watched its gradual perfecting.

And constantly into the world outside

BUILDING THE LOG BATH HOUSE.



Interlaken the boys go for lessons in the productive processes of life, and its basic economic conditions. In small parties they make repeated trips to neighboring factories and mills and the nearby scenes of important constructive work. Noteworthy industrial feats, like the damming of a river, the building of a city like Gary, the sinking of deep tubular wells, the building of a railroad, attract them on free days. A visit to a foundry to see all the stages of the melting process is a vital experience. The lining of the ladles with clay, the charging of the cupola with iron and coke, the opening of the blast, the making of molds and cores, the pouring of the molten fluid, the dumping and rattling of the finished castings—how intently the boys observe it all. The experiences of such excursions are employed as illustrative and stimulating material in the classes of physics, chemistry, history and geography. The discussion of the underlying laws knits the fragmentary information together in an organic whole in the mind of the pupil. And in the shops of the school itself a new interest and impetus and skill are given to work.

Here is a composition written by a ten-year old boy after a visit to the United States Steel Corporation's new plant at Gary. He had been told to write of his experiences in the wonderful new city. He chose the thing he saw that interested him most:

First I was brown earth buried in a mountain near Lake Superior. Then men came in great boats and called me iron ore and dug me out, and sailed away with me over the blue waves to Gary. With big shovels on wire ropes they hurried and lifted me out of the boat and dumped me in a pile on the land. They put me into towers with coke, and a hot fire changed me and melted me into iron and I flowed like water. They cast me into red-hot blocks five feet long and two feet thick, and then rolled me between iron rollers until I got thinner and thinner. At last I was long and thin like a rail, and then they cut me into seven pieces, and ran trains over me.

SUCCESSFUL TEST OF A NEW ENGINE.

LAYING A CORDUROY ROAD.

The appeal of this school to practical men has brought rapid success. Three times within three years Interlaken has outgrown its accommodations, and now a greater Interlaken is being built, planned to receive eventually 400 boys. Some 640 acres of fertile and generously wooded land have been selected for this model plant, in the very heart of the country overlooking Silver lake. And here the boys, more than seventy of them, encamped with their teachers and aided by competent architects, have been working all summer on the plans for the new school. They are making the desks, tables and chairs needed for each room. They are making door knobs and hand-wrought hinges.

And on this new farm, from their camp, thirty of the boys, directed by a Dutch gardener, have planted and cultivated the garden that furnishes the table vegetables. They have cut and stacked field after field of hay and harvested a good crop of wheat. They have built roads, a bath house of logs, a boat house, several piers. They have worked like slaves to bring into condition two old farms that have become a part of the school, bringing order and prosperity out of neglected fields and buildings. A fifty-

acre field has been selected which is to be sown, the first in the district, with alfalfa. And they have drawn plans for a greenhouse. Thus practical agriculture becomes a part of the school course —a thing of looming importance. For the development of farming during the coming century will surely mean, in some respects, more than the growth during the nineteenth century, of the factory system. For this present day, all boys, city boys as well as country boys, should learn of the possibilities of the soil, should see that plants are plastic like clay, to be shaped to serve our purpose. And they should have experience of tilling the earth.

The new Interlaken is building extensive shops, including a forge for the shaping of metals. There will be lathes, planers and other basic tools of the machine shop; and work will begin, as in the past here, with the making of hammers, chisels and other tools. In the wood-working department machines will be used to supplement hand work. And the print shop will issue all printed matter required by the school—laundry slips, letter heads, booklets, catalogs.

It has just become part of the plan to publish an educational journal, to which some of the leading educators in this country and abroad have already promised to contribute. And business men, who are feeling keenly the dearth of skilled workers, and who know the demands of practical life, will write from their viewpoint. There is no fear at Interlaken that business and vocational training will taint the course of studies, for, they say, business and industry are the basis of our lives, and the school should prepare the boy for his life's work.

Again we come to Interlaken's ambitious program: "To shape, in theory and practice, the outline of the new American school."

MAKING ALL MATCHES "SAFETIES"

THE WORLD-WIDE FIGHT AGAINST PHOSPHORUS POISONING

JAMES P. HEATON

Of the two hundred and fifty billion matches used yearly in this country—more than seven a day for every man, woman and child—four-fifths are of a type that practically every nation of commercial importance prohibits. For the head of the ordinary "double-dip" parlor match, the tiny round tip, is made of a poison worse than deadly to many of the workers in match factories. Stealing insidiously through a tiny crack in a tooth, it rots the tooth, rots the jawbone, requires mutilating operations and sometimes results in death after lingering years of suffering. The dead bone, imbedded in living flesh, discharges its foul remains through cheek and mouth. Phosphorus necrosis, commonly called "phossy jaw," in match makers is so terrible that it might be considered good reason for returning to the flint and steel of our forebears if there were no other way of making fire.

But there is a harmless substitute for the poisonous white phosphorus. It is to our disgrace that the United States has lagged behind other lands in demanding its use. The indifference of big business, the tariff, internal revenue taxes, a "trust" smothering the harmless but more expensive material, a lack of public information on the subject, and the voiceless obscurity of the match workers have all been factors in our tardy beginning last year to wipe out this unnecessary industrial disease by the Esch bill in congress.

Match manufacturers have struggled for three-quarters of a century to minimize the danger. Frightful epidemics of necrosis ran through the pioneer shops in South Germany and Austria, which

were the early centers of the trade. The first steps were to require personal cleanliness, and good ventilation to do away with the extra-dangerous fumes from damp phosphorus. Separate rooms were set aside for preparing the match head, for dipping and drying, and for packing. Improved machinery was invented. The percentage of phosphorus in the paste was limited. Eating in workrooms was prohibited, and women and children were excluded from many branches of the work. The regulations were so stringent that many small manufacturers were driven out of business while others rebelled and made matches in defiance of the laws.

The laws did all that could be done so long as white phosphorus was used. They prevented a recurrence of the epidemics but they did not eliminate necrosis. It is impossible for statute law to make every worker observe rules that restrict unconscious impulses, such as picking the teeth, which carry the poison into the system.

For sixty years manufacturers experimented with substitutes for white phosphorus. In 1851 Bell and Black in London made matches of red or amorphous phosphorus, but these would strike only on a rough surface and ignited explosively. In 1855 Lundstrom, a Swede, produced safety matches by putting red phosphorus with sand on the box. Neither of these is of the "strike anywhere" variety popular in this country, for although two American factories incidentally make safety matches, there is as yet comparatively little call for them, and the little wax tapers used extensively abroad are almost unknown here. It has been a clear-cut issue between a match a little less easy to use and a match whose manufacture is dangerous to the workers.

One after another the countries of Europe have proscribed poisonous phosphorus. Finland and Denmark took the lead over thirty-five years ago. In Switzerland it was barred in 1881. The poor quality of the matches led to a repeal of the law and regulation was again attempted, but it failed and the prohibition was re-enacted. France passed a similar act in 1897 and Holland in 1901. In 1906 the International Association for Labor Legislation negotiated a treaty proscribing white phosphorus, which was signed by France, Denmark, Luxemburg, Italy, Switzerland, the Netherlands and Germany. Sweden does not permit poisonous matches for home use and Russia taxes them prohibitively. Great Britain decided to prohibit them in 1908.

The tardy attitude of the United States was in part due to the fact that we did not at first have quite as serious trouble as the old world, though for the last twenty years we have had more through a failure to protect the match workers. For a long time our factories made more use of machinery. Phosphorus necrosis, it is admitted, was quite prevalent here twenty years ago, but it was generally supposed that the disease had been successfully combated. No American state has adequately protected its match workers, though several forbid the employment of children under fifteen years of age in certain operations. Finally, in 1909, as result of the activity of the American Association for Labor Legislation, a branch of the international body, agents of the government visited fifteen of the sixteen American match factories and found sixteen cases of phosphorus poisoning. Eighty-two cases were discovered in the homes of the working people of three factories, and in one modern factory they secured records of forty cases. The leading authorities on the subject and the principal manufacturers agree that there is no way to prevent necrosis so long as white phosphorus is used. In some of the small factories employes and even owners were unaware of the danger, and in several there were not even notices to warn the workers.

An investigation of the factories made by John B. Andrews, secretary of the American Association for Labor Legislation, was published as a report of the Bureau of Labor. This made a strong impression on President Taft and the problem was referred to Representative James R. Mann, chairman of the committee on interstate commerce, to devise some way of prohibiting its employment.

Later it was decided that the trouble could not be remedied through interstate commerce regulation, and a bill was introduced in Congress by Representative John Esch of Wisconsin to place a prohibitive tax on matches made of poisonous phosphorus. Many congressmen are loath to see the taxing power of the government used for any purpose other than the raising of funds, but it seems to be the only practicable method of meeting the problem. The introduction of this bill following the agitation by the Labor Legislative Association has put the match manufacturers on the defensive, and seems to promise a willingness on their part to co-operate in doing away with "phossy jaw." The bill will come before Congress again this month.

The history of match making in this country is interesting. There were at one time seventy-five match companies in the United States, but the internal revenue taxes following the Civil War drove many out of business. Large makers were granted a special discount for purchasing the revenue stamps in big lots. There are today only sixteen match factories. The organization of the business into a trust was inevitable under the circumstances, and on the shoulders of this trust, the Diamond Match Company, rests the chief responsibility for the present state of affairs.

The most used of the harmless substitutes for white phosphorus, the sesquisulphide of phosphorus invented by French chemists under government commission, is a compound made by baking white phosphorus in a closed vessel. This is held in this country under a patent, which will expire in five years, by the Diamond Match Company. A few years ago the company advertised a non-poisonous match, but the jobbers, it is said, returned forty per cent as defective. It is important to note that the cost of manufacture was about five per cent more than for ordinary matches—and their production was shortly discontinued. No further step was taken until last year. At that time, owing to the government investigation, the Diamond company volunteered to assist all manufacturers in eliminating the danger of phosphorus, and in March, 1909, the president wrote that if the government prohibited white phosphorus his company was willing to allow the use of sesquisulphide by other manufacturers on "equal terms" with itself. These terms were specified last July. The first requirement was that the manufacturers, who together with the Diamond company produced ninety-five per cent of the matches in this country, should agree "to join in an effort to induce the president of the United States to direct the tariff commission to make an investigation, with a view to determining the difference between the cost of production of matches abroad and in this country."

The Diamond company values the American patent in sesquisulphide at $100,000. This figure, it is stated by the company, is based upon the amounts paid for the patent. It is said not to include the amount spent in experimental work and for expert services and the losses sustained in the sale of sesqui matches. The fact that it has already sold a concession to use the patent in certain other countries is not mentioned by it in the negotiations with the independent companies here. The Diamond company requires each independent to pay for the use of the patent that percentage of $100,000 which its annual production bears to the total output of the country. Each will be limited to the amount produced during the year ending June 30 last, plus its share of the annual increase. A royalty of four-tenths of one cent for each 1,000 matches is exacted for any production over this quantity. Manufacturers will be permitted to use any other available substitute for white phosphorus. It was provided further that "no licensee shall pack more than 500 sesqui matches in any one box and not more than 250 matches any one way in any one box, this restriction being prompted solely in the interest of public health and safety."

The smaller concerns, though anxious to do away with white phosphorus, were slow to come to terms with the Diamond Match Company. This was natural because of the energetic and often questionable methods which they alleged the larger company has employed in the past

in its effort to get trade. Fostered by both the tariff and internal revenue law, the Diamond company resorted to the sharpest of price-cutting tactics to kill the remaining competition. The independent companies sometimes found their matches sold below their own price and they charged that the larger corporation bought up the goods to break their market. Each side imitated the popular brands of the other. The Diamond company was even accused of storing its rivals' goods in damp basements in order to spoil them and injure their sale. At other times, it is alleged, in order to get the wholesale dealers to take Diamond products, that company took the stock a merchant had on hand and sold it below market. On its side, the Diamond company was continually worried by a succession of rivals who temporarily sold cheap, inferior matches, until the trade refused to buy more.

After years of such guerilla warfare, the Diamond Match Company came to be feared and hated by its small rivals. More recently it has maintained prices and, in fact, sells its wares for higher prices than do the smaller companies, and accusations of unfair trade practice against it are now comparatively few. On the other hand, some of the smaller companies are often guilty of repacking defective matches under *noms de plume*.

The most serious trade charge against the corporation now is alleged against its special contracts with wholesale firms, by means of which it consigns goods to a dealer but retains the title to them and requires the dealer to handle its product exclusively. For this it grants a special discount of ten and sometimes fifteen per cent. This hampers the independent companies, even though the contract be broken as it sometimes is, for many wholesale firms are closed to the independents. Technically, each wholesale grocer is made a special selling agent on commission of the Diamond Match Company, but in effect the contract is in restraint of trade and can be enforced because the wholesalers must carry some of the Diamond brands which are well-known and called for by name. As a result, one small manufacturer has been obliged to deliver his goods direct to the retail grocer and this restricts him to a local market.

The independents objected to the proposed contract for use of sesquisulphide on several grounds. For one, they had no tangible evidence of the cash value of the patent which was made the basis of the charges against them for its use, and they had little inclination to take the Diamond company's figures at face value. For another thing, the limitation of matches to 500 in a box seemed to them to be an attempt to kill the business which certain companies have developed in the sale of a five-cent box of 1,000 matches. In this there is little profit and most of the companies disapprove it. The license was amended to allow as many as 1,500 matches in a box provided they were packed topsy-turvy, which requires a very large box; the signing of the letter to President Taft, asking for an investigation of the cost of production at home and abroad, was made optional; the requirement that the companies producing ninety-five per cent of the matches should sign the contracts was changed; and additional time was granted to consider the terms. Certain objections were made also to the limitation of production, though the royalty from excess does not equal the profit and the limitation affects only matches made of sesquisulphide. The Diamond company amended its agreement further in an effort to determine the share of each independent on the basis of one, three or ten years' production. It submitted samples of its experimental matches made of sesquisulphide, allowed its rivals to make their choice, and gave to each the formula for the match chosen. There was also a slight fear that the sesqui match was not satisfactory and that foreign companies would invade the country more than they do at present, as the Payne-Aldrich bill reduced the tariff on safety matches twenty-five per cent, which harms the independents most, for the Diamond company has factories abroad and is interested in other foreign firms, though not to the extent of being willing to kill its American business. To overcome this condition the

Diamond company recently endeavored indirectly to have safety matches classified as fancy goods which are subject to a high ad valorem duty, but the effort failed.

All of the objections seem finally to have been met. Eight independent companies agreed to execute the stipulations and seven have signed already. Two or three have as yet declined to enter into negotiations, one because of distrust and a desire to continue the match it now makes, and another, The East Jersey Match Company of Garfield, New Jersey, because it is manufacturing a non-poisonous "strike anywhere" match of red phosphorus known as the Salvation, which ignites with little difficulty and a slight splutter and is being closely watched as promising another substitute for white phosphorus.

By mutual agreement it seems probable that within a short time all of the American match companies will discontinue the use of the poisonous white phosphorus. The immediate steps leading to its discontinuance are the willingness of the companies to get together and adjust their business to the contract offered by the Diamond company. They have realized a growing public opinion against the poisonous match. This deserves high praise, tempered, however, by the recollection that the Diamond Match Company has had in its possession for years the formula and sole American right to the harmless phosphorus, and that it failed to act until the pressure of public opinion and the impending federal legislation forced its hand.

FROM CAVE LIFE TO CITY LIFE

LEWIS E. PALMER

On the afternoon of November 12, forty-four thousand people of Boston and the metropolitan district gathered in two of the largest structures of their kind in the country for two varieties of entertainment. Forty thousand of them managed to jam into the concrete tiers of the Harvard Stadium to see the last local football game of the season. They say that Harvard won because of better team work; because every man was a part of an almost perfect football machine that never failed nor weakened once.

Four thousand of them crowded the iron-girdered Arena with its horseshoe-shaped enclosure and saw the third performance of a civic pageant called Cave Life to City Life which, so the directors of the pageant believe, was a success for the same prime reason that the Harvard eleven won its laurels—because the "pageant team" played together and caught the spirit of the game as truly as did the football team across the river.

The preliminary work of organizing and training a group of over a thousand volunteer performers was, in the eyes of the pageant director, the most important part of the production. In the weeks of rehearsing that preceded the four performances in the Arena, citizens from a score of towns surrounding Boston, members of widely separated social clubs, settlements, high schools, colleges, labor unions, historical societies, and like organizations were thrown in with one another. Commonwealth avenue and Beacon street met with the North and West Ends. Old wardrobes were ransacked for prized dresses and uniforms, spinning wheels were taken from parlor and attic and actually used in the preliminary rehearsing as well as in the performances themselves. Quilting parties were held as they were a hundred years ago, the dame school flourished once more, a century old coach clattered into town on the first day of the pageant to bear the powdered and pompadoured members of the governor's party to the reception and minuet, old songs that were known in the schools of generations ago were heard once more, folk dances were rehearsed by a dozen groups of new Americans—in

short Greater Boston joined in one big neighborhood party and learned about itself, what it had done and what it could do through the well organized "team work" which is being fostered by Boston-1915, sponsor for the pageant.

Pageantry is new to this country. Five years ago it was revived in England and under the direction of Louis N. Parker produced the first American pageant, The Pageant of Education, presented by the Boston Normal School. About a year ago she was at the head of the smaller Charlestown pageant, and when Boston-1915 thought of a pageant as a means of quickening civic life and interest, it turned to Miss Clark to whose enthusiasm and efficiency is due, not

OYEZ! OYEZ!

Thomas Crane, town crier in the Boston pageant.

a half dozen or more pageants were produced in towns like Sherbourne, Oxford, Warwick, Bury St. Edmonds, and Dover, whose history made pageantry possible. Lotta A. Clark, head of the history department of the Charlestown High School, happened in Oxford while the interest in the pageant was still active, and returned to this country and only the success of Cave Life to City Life, but the awakened interest in pageantry as a civic educator that is bound to spread to other parts of the country as well.

The Boston pageant, while following the same general ideas as the English productions, went a step farther and portrayed "future history" as well as

AT THE GOVERNOR'S RECEPTION.

past events. Thus, for the first time in the United States, the pageant went beyond a mere historic representation of the past and tried to show possibilities ahead.

Cave Life to City Life was divided into four episodes showing The Cave Dweller in His Solitary Home, Life in an Indian Village, and Present Success and Future Development. The Massachusetts Historical Society has records of about everything that has happened or is supposed to have happened in New England, but when it came to fitting out the cave man and his family, the imagination of the pageant directors had full play. The only scenery in the pageant was the cave home at one end of the Arena floor. From the mouth of the cave appeared Father Time in the glare of the spot light and chanted an invitation to Labor, Progress, Success, Prosperity, Peace, and Happiness to assist man in his work. The first episode showed the cave man and his family gathered around the first hearthstone.

Episode II was introduced by a symbolic dance, Vineland's Welcome to the Norsemen, presented by Virginia Tanner. From a half dozen reservations in Western New York and Canada a tribe of Iroquois Indians, who have been producing Longfellow's Hiawatha at Chautauqua and New Rochelle, came to Boston to depict life and customs among the red men. Boston learned before the week was over that they were sure enough Indians—one of them was particularly anxious to meet Chief Longfellow—and their native dances and songs gave realism to this part of the pageant.

In the third episode the colonists appear—hundreds of them—from early settlers with coats of mail to demure maids and bustling matrons, all of whom assisted in establishing a home in the wilderness. A stockade was built just in time to shelter the colonists from the attack of the Indians, who are finally defeated after considerable rumpus has been stirred up with bows and arrows

and flint lock muskets. This scene of the episode ended with the migration of the settlers to a place of safety.

The next scene showed the colonists with community life established. A Thanksgiving proclamation was read by the town crier and an ox cart laden with corn entered, surrounded by hundreds of boys and girls, who joined in husking bees and old-fashioned reels to the tune of Pop Goes the Weasel. Then came the announcement of the passage of the stamp act, followed by a riot which was quieted by the Rev. Jonathan Edwards himself, who demanded that the town people go about their business.

The scenes which followed made up perhaps the most beautiful part of the pageant. The participants scattered into various groups which impersonated a spinning school, the dame school, a quilting party, and a singing school. The combinations of color made by the old time colonial gowns of the women and the more somber clothes of the men, produced a most effective spectacle, which came to a climax when all joined in the minuet following the governor's reception. This reception was founded on an actual historical instance when Governor Wentworth announced to his birthday guests that he was to marry Martha, his maid-servant. A well-worn stage coach which saw service in the White mountains a century ago brought some of the powdered members of the governor's party to the reception. Others came on pillions, in chaises, sedan chairs, and on foot to "tread the stately minuet." There were 400 in this final scene of the third episode.

Present Success and Future Development was the title of the last episode of the pageant, and it was here that Cave Life to City Life cut loose from English example and peered into the city of the future, where disease shall be abolished and justice reign supreme. Boston and Her Neighbors, a group from the Boston Teachers' Club representing Boston and surrounding towns, took a position in the center of the Arena floor and before them the pageanters passed in review, each group representing either contrasts in past life with hopes for the future city, or present day comforts compared to the inconveniences of times gone by, or the assimilation of all nations into the true American city.

Just preceding the arrival of Boston and Her Neighbors, Miss Tanner presented a symbolic dance, the Passing of the Indian. Around her in the dimly lighted Arena were grouped the red men,

THE SPINNING SCHOOL.

who gradually drew back from one end of the floor to the other as the dance proceeded, until they were forced to the mouth of the cave. Behind the town crier with bell and proclamation in hand came a yelling crowd of newsboys with "ten o'clock editions." The pillions, sedan chairs, chaises, and coaches used in the governor's reception were followed by an electric automobile equipped with Edison's latest batteries; and above the group of old time conveyances which took their position back of Boston and Her Neighbors was suspended a Sterling-Burgess aeroplane. The dame school, hard at work over catechism and Three R's, made way for a group of seventy-five high school girls who went through the gymnastic work of the schools of today. Dust Clouds and Disease Germs attacked the city and were repelled by the Knights of Economy. Fire and Flame dancers try to break into the city of the future to no avail and grouped themselves, with the rest of the pageanters, behind the central group, Boston and Her Neighbors.

The Assimilation of the Nations was represented by folk dancers—natives of Sweden, Russia, Italy, Holland, Hungary, southern Europe, Scotland, England, Ireland and Greece, followed by the American dance of seventy-five members of a Boston high school. The pageant was brought to a close by patriotic hymns and a chorus of 400, which had also sung at intervals throughout the production.

Professor Baker of Harvard says that "the rapid development of public interest in pageantry in England and the United States during the past few years shows that it supplies something the public lacks." That statement was pretty well borne out by the crowds that witnessed the Boston-1915 pageant. The Arena, with a seating capacity of about 4,000, was well filled at each of the four performances, in fact on Friday and Saturday evenings general admission tickets were sold. A pageant, be it remembered, is not to be compared to an ordinary "show" or dramatic performance. It is rather a new tool for community education and civic enterprise, and Cave Life to City Life has shown how pageantry may fit into the social and civic life of a big city as well as into the smaller towns where its development has been more rapid.

TOLSTOI'S "RESURRECTION"

CRIME A PUNISHMENT AND PUNISHMENT A CRIME[1]

A. S. GOLDENWEISER
MEMBER OF THE BAR IN KIEV, RUSSIA
(Translated by E. A. Goldenweiser, Washington, D. C.)

Light waves sent out by fixed stars reach the earth after years, decades, or centuries of travel. The light emanating from the sun strikes the earth, is reflected by it and carries its image to the stars, which in turn reflect the light, and the image finally comes back to earth. On this scientific observation is based the fancy that had we optical instruments sufficiently sensitive to gather the light waves on their return and to reproduce the image they contained, we could see with our own eyes any past event which had taken place on earth. For example, if we wished to see what was happening a hundred years ago, we could do so by pointing our instrument at a star from which it took fifty years for the light waves to reach here, since fifty years ago that star reflected the light which had left the earth another half century earlier.

Had we at our command such an imag-

[1] This essay on Crime a Punishment and Punishment a Crime was characterized by Tolstoi in a letter to the translator as "bringing out with great force and clearness my thoughts, dear, to me, about the unreasonableness and immorality of that strange institution which is called a trial." The essay as it appears in THE SURVEY is greatly abbreviated. Copies of the full text may be obtained by writing to: E. A. Goldenweiser, 400 Seward Square, S. E., Washington, D. C.

inary apparatus it might be curious to direct it to a star reflecting a picture of the city of Madrid on May 30, 1680. On that day the marriage of King Charles II to Mary Louise of Orleans was celebrated, and twelve heretics were publicly burned at the stake in the presence of the royal couple. To a modern observer the pageant would appear very imposing.

At the head of the procession comes the chief inquisitor from Toledo. Behind him the choir of the royal chapel, singing the Miserere, then the chief of the Dominicans and the monks, followed by the emblem of the Inquisition, the green cross covered with black crepe; members of the judiciary, and the censors, representatives of the learned classes, officials of the Inquisition with lighted green candles, a white cross, the maiden attendants of the tribunal of the Inquisition, carrying lighted white candles; after that come Inquisitors, Dominicans, Franciscans, Trinitarians, Brothers of Mercy, Barefooted Brothers, the Marquis de la Vega, knight of the Order of St. Jacob, and the Duke of Medinacelli; banners of the Inquisition; the Marquis of Coguladó; the orphans and the foundlings. The procession comprises seven hundred people and closes with five bearers of the stakes of the Inquisition.

The market place is reached. The chief inquisitor descends from the covered seat on which he was carried and approaches the altar in the center of the place. He dons the raiment of sacred service. He reads a mass. Then a Dominican monk delivers a sermon on the text: "Arise, O Lord, and destroy thy enemies!" Then the verdicts of the tribunal are read. Each prisoner as his name is called is led to the platform and locked in a separate cage. One man and one woman at the sound of their names loudly beg for mercy; they repent their sins and consent to all the demands of the tribunal; they are granted their lives, but are sentenced to life-long imprisonment. One by one the other unfortunates are taken out by the executioners and led to their pyres; they are fastened to the stakes by iron collars and the wood is piled around them. The first firebrand is thrown in the name of the king, and soon all the stakes and the victims are encircled by flames.

Although the day is hot and sultry, the king remains in his seat of honor to the end. At nine o'clock the last heretic expires in agony but guards stir the fire all night, and in the morning they cover the platform with a thick layer of earth.

What would be our sensations if we were to witness this event of long ago? We would be shocked and outraged at the sight, and would earnestly scan the faces of those who participated, in an effort to ascertain their thoughts and feelings during the performance of their barbaric deed. We would, however, discover no trace of any feelings similar to those which we ourselves experienced while watching the procession. Each member of it is doing his best, and is earnestly and solemnly trying to perform his part with propriety. Not a single muscle of their faces indicates any doubt as to the justice of the execution of their unfortunate brethren. Quite the contrary. In performing their allotted duties, they all seem perfectly at ease and indifferent to the rest of the procession; they are evidently thinking of the appearance they make or of utterly foreign matters, and are not in the least concerned about the terrible significance of the deed which they are helping to perform.[1]

After two centuries of progress have disclosed to us the barbarity and the futility of such proceedings, we realize the incongruity of the deed which was performed with such firm belief in its justice and reasonableness, and we are shocked the more by the unconscious solemnity of the performers. Imagine a spectator of that atrocity of May 30, 1680, who experiences sensations similar to our own; a man who is born in the dark ages, but who has not only developed ideas of humanity two centuries in advance of his contemporaries, but whose entire cycle of emotions reflects the at-

[1] The Spanish translator of this essay here stated that J. Rizi, a painter who lived at the time that this event took place, reproduced the spectacle in a picture, and the natural, unaffected expressions of the faces in the procession proved the accuracy of the above description. This painting was intended to preserve the memory of Charles II, and is exhibited (No. 1016) in the Prado Museum at Madrid.

titude of the twentieth century; imagine such a man, and you will have a clue to Tolstoi's attitude toward modern penal actions, which he has sincerely and truthfully depicted in his description of Maslova's trial in the Resurrection. Tolstoi's opinions and feelings in regard to that trial will be comprehended by the masses only after the passing of several generations.

In depicting a trial Tolstoi immediately and graphically brings out a feature of criminal practice which cannot escape the notice of an observer uninfluenced by the accepted routine, but which passes unobserved by most. It is but natural to suppose that men who have come together to clear up a murder case and to try the murderer would on the one hand be interested in the sad fate of the victim, and on the other, in the future of the culprit. In reality, a trial does not seem to be concerned with either of these things, and what is said and written about the victim is disgusting in the extreme. Here, for instance, is the record of the post-mortem examination of Smyelkov's corpse:

(1) Ferapont Smyelkov's height was two arshins and twelve vershoks.[1]

"I declare, he was a strapping fellow," the merchant, with an interested mien, whispered over Nekhlyudov's ear.

(2) His age was, from external appearances, approximately fixed as forty years.

(3) The body had a bloated appearance.

(4) The color of the integuments was greenish, here and there tinged with darker spots.

(5) The cuticle on the surface of the body had risen in postules of different size, and in places had come off, and was hanging in the shape of large flaps.

(6) His hair was dark blond, thick, and at the touch came out of the skin.

(7) The eyes stood out of their sockets, and the cornea was dimmed.

(8) From the apertures of the nose, of both ears, and of the cavity of the mouth, a lathery, foamy, serous liquid was discharged, and the mouth was half opened.

(9) There was no perceptible neck, on account of the bloated condition of the face and chest. And so on, and so on.

Of the defendants, their past and their present, their impending fate and their future—not a proper word was said during the entire discussion.

Tolstoi feels that the motive of the trial is not sympathy, but selfish anxiety, pure and simple. "Since these people have committed the murder," think the judges and the jurors, "let us put them away, or else they may as likely as not do away with one of us."

This indifference to everything except their own personal safety takes one aspect with the judges who are performing their habitual everyday task, and another with the jurors who react more directly to what is going on about them. The judges think about their private needs and troubles, totally oblivious to what is happening; the jurors show a certain interest in the examination. But in what manner? "Evidently he was a great hand at drinking," said the merchant juror—when the presence of a large amount of wine in the deceased Smyelkov's stomach was mentioned. "Well, he had a good-sized finger," the same juror remarked later, after he had tried on the dead man's ring which was placed on the table with other exhibits; "as big as a cucumber," he added—obviously enjoying the conception of the hero which he had formed of the poisoned merchant. This manner of interest has little in common with sympathy for the deceased. The jolly juror seemed to approve heartily of the poisoned man's taste in recreations, for during the recess in the jury room he exclaimed. "Well, he was a great carouser! In Siberian fashion. He knew a thing or two when he selected such a girl to kiss."

Tolstoi cannot conceive why no one realizes the great responsibility and even the audacity of a common mortal assuming, as he does in a criminal trial, that he may separate his neighbor from his family and his friends, and subject him to the tortures of a punitive regime and of compulsory hard labor for a number of years. To Tolstoi, the participants of a trial seem to have about as much interest in the defendant as the undertaker has in a corpse which he takes to the graveyard. Does an undertaker's establishment puzzle about the mysteries

[1] An arshin equals twenty-eight inches and a vershok one and three-quarters inches. This and all following quotations of Tolstoi's text are taken from Leo Wiener's translation, Dana Estes and Company, Boston.

of life and the fateful trend of events which lead to the death of all living things, or of the effects on human existence of the inevitableness of death? According to Tolstoi, the modern criminal tribunal is just as little concerned about the essence of the crime and the soul of the transgressor; the courts simply bury the individuals whom society hands over to them to dispose of.

The procedure would have been just as absurd had Maslova been acquitted. Tolstoi is not concerned about the error committed by the court, but about the essential immorality of all criminal trials. The whole force of the characterization of Maslova's interesting personality lies in the fact that an acquittal would have made no difference in her moral condition.

Tolstoi's impression of the trial is that neither the prosecutor who pleads for conviction nor the counsel who pleads for acquittal, neither the court which sentences the convicted, nor that which releases the acquitted, does anything to save a life from going to ruin or to safeguard society. This was the "something" which Nekhlyudov felt that he saw in the procedure of trial and punishment—and which others failed to see.

The method of trial depicted by Tolstoi is the best that humanity has devised—the trial by jury—and yet Tolstoi is most condemnatory in his attitude toward it.

Tolstoi is of the opinion that the artificiality of the whole system of criminal retribution is shown by the fact that convicts in prison, in transit, and at hard labor—who are bearing punishment and who, according to the spirit of the law, should be going through a regeneration—in reality do not feel any such effect from the penal regime, and remain the same in all their thoughts and actions and are just like other people and like their former selves.

The men who do lose their human qualities are not the convicts, but the guards, jailers, inspectors, supervisors, gendarmes, and all the rest, who assist in carrying out the verdicts. They are delegated to perform a duty which is revolting and the performance of which must needs be bigotry, affecting the entire personality of the official. Nekhlyudov expresses this thought in the following manner:

"The trouble is that people think that there are conditions under which one may treat men without love, whereas there are no such conditions. Things may be treated without love: One may chop wood, make bricks, forge iron, without love, but people cannot be treated without love, just as one cannot handle bees without care. Such is the property of the bees. If they are carelessly handled by a person, they hurt both themselves and him. Just so it is with people. This cannot be otherwise, because mutual love between men is the fundamental law of human existence. It is true a man cannot make himself love as he can make himself work, but from this it does not follow that people may be treated without love, especially if something is demanded from them. 'If you feel no love for men—keep your peace,' Nekhlyudov thought, addressing himself. 'Busy yourself with yourself, with things, only not with men. Permit yourself to treat people without love,—and there is no limit to cruelty and bestiality.'"

The hardened sensibilities of those who carry out the punishments' decreed appear in many scenes in the light just indicated. Here is a quotation:

The assistant superintendent was a blond young officer, with blackened moustache, who was spreading around him an atmosphere of eau de Cologne.

"Please follow me," he turned to Nekhlyudov with a pleasant smile. "Are you interested in our establishment?"

"Yes; and I am also interested in that man, who, so I was told, is quite innocent."

The assistant shrugged his shoulders.

"Yes, such things happen," he answered calmly, politely letting the visitor pass before him into the stinking corridor. "Often they lie. If you please!"

Or, here is an account of Nekhlyudov's interview with the general of the gendarmes in St. Petersburg:

"But he needs scientific books; he wants to work."

'Not only is the position of the prisoners' legal guardians equivocal, but also that of any outsider who approaches them, even though he may be moved by the noble intention of alleviating their fate, and of rendering them spiritual and material relief. The representative of an English evangelical society who visits the prison for transients in Siberia and moralizes to the prisoners, supplying a certain number of Bibles to each cell, looks positively ridiculous. Real help can come only from him who is strong in spirit and who does not deal with the prisoners from the outside, but is imprisoned and robbed of his freedom in the same way that they are.

"Don't believe that." The general was silent for a while. "That is not for work. Nothing but unrest."

"But they have to do something to occupy their time in their heavy situation," said Nekhlyudov.

"They always complain," said the general. "We know them."

He spoke of them in general, as of some especially bad tribe of men.

"They are furnished such comforts here as one will rarely find in places of confinement," continued the general.

And, as though to justify himself, he began to tell in detail of all the comforts which the prisoners had, as though the chief aim of this institution consisted in providing pleasant quarters for its inmates. . . .

"They get books, both of a religious character and old periodicals. We have a library. But they do not like to read. At first they seem to be interested, and afterward the new books remain half uncut, while the pages of the old ones are not turned over. We have tried them," said the baron, with a distant resemblance to a smile, "by putting pieces of paper in. The papers remain untouched. Nor are they kept from writing," continued the general. "They get slates and pencils, so that they may write for their amusement. They may rub off what they have written, and write over again. But they don't write. No, they very soon become very quiet. Only in the beginning they are restless; and later they grow fat, and become very quiet," said the general, without suspecting what terrible meaning his words had.

Tolstoi's description of the judges aroused a dissatisfaction amounting to indignation among the members of the bench. This was due, undoubtedly, to a misunderstanding on their part, and was the result of offended self-esteem which prevented them from looking at the matter from the author's point of view. Tolstoi not only considers a criminal trial as unnecessary, purposeless and cruel, but also revolting to human nature. The question in his mind is: How can so many people spend so much time in doing, by vocation and of their own free will, something that is essentially inhuman? Tolstoi answers this by pointing out that, while apparently serving justice, the judges are really occupied with other matters. They do their work mechanically, as a matter of habit, or when it is new to them, out of curiosity, but they never fully realize the awful significance of a criminal tribunal. The reason for their ignorance of the full meaning of so-called criminal retribution, Tolstoi sees in the division of labor and of functions, in the artificiality of the present social structure which, in this case, results not in the greater efficiency of the subdivided activities but renders the participants of a cruel deed unconscious of the purpose of that deed.

From Tolstoi's standpoint, the extraneous thoughts which absorb the judge's attention are really their justification for being capable of holding court and ordering the execution in the same way that the inquisitors ordered the "auto-da-fe." Tolstoi can better understand a judge who, during a trial, is absorbed by the thought of a meeting with Clara, the governess, or by the contemplation of a dinner in a lunchroom because his angry wife refused to cook one at home, than one who, with heart and soul, directs his conscious efforts toward locking up a man in jail, or separating him from his family and his home and driving him to the far-away mines of Siberia. This latter type is depicted by Tolstoi in the hero of Ivan Ilyich's Death. Tolstoi's hope and desire are not to see a reform of criminal trials and of the judges, but a flat refusal of men to take part in such activities.

Incidentally, it is a striking confirmation of the truthfulness of Tolstoi's picture that Russian trial judges consider his description of the senators remarkably accurate, and the senators think the same in regard to the trial judges.[1]

It would have been strange indeed had Tolstoi erred in his description of the inner world and the emotions of a judge, for Tolstoi penetrates unerringly into all kinds of inner worlds and all sorts of emotional situations, regardless of whether he has ever experienced, or

[1] Tolstoi took the same negative attitude toward criminal trials as early as the appearance of War and Peace. In describing the court-martial of Pierre Bezukhi, Tolstoi incidentally gave the following characterization of trials in general:

"Their only object is to secure a conviction. The court's questions neglected the live essence of the matter, and eliminated the possibility of its disclosure: the questions were similar to all questions asked in court and served only to supply the trough along which the judges wished the answers to flow, leading to the desired end, that is, conviction. As soon as he began saying something which did not serve the purposes of the prosecution, the trough was removed and the water could flow wherever it liked. Besides, Pierre experienced what the defendant experiences in all trials, namely, bewilderment at the mass of purposeless questions hurled at him."

could ever experience, the conditions or emotions. In all probability, Tolstoi never spent a night in a prison cell for women; and yet, what can be more real, truer or more alive than the description he gives of the inmates of Maslova's cell, with all their inner emotions, their thoughts and their desires. Here are the types:

The sullen, scowling, wrinkled Korableva.

The old woman, Menshova, who with her son was accused of arson and who bore incarceration with the greatest good humor ("such a charming old woman," says Maslova about her when asking Nekhlyudov to intercede for her and her son).

The red-haired prisoner, who had a fight with Korableva and then wept on her bunk, thinking that she was not heard, as only children weep, groaning and snuffling and swallowing her bitter tears. She wept because she had just been cursed and beaten and not given any liquor, because all her life she had seen nothing but scoldings, ridicule, affronts, and blows, and finally because of the memory of the sad ending of her first love for Fedka Molodenkov, the factory hand.

The proprietress of a saloon who was detained with her two children—who were with her because she had no place to leave them—was holding her girl between her legs and with agile fingers searching for vermin in her head and whispering to herself: "Why do I traffic in liquor? What shall I feed my children by?"

The prisoner who was called Khoroshavka (pretty one) for her neatness, who was no taller than a ten-year-old girl, swarthy, misshapen, with a long spine and very short legs.

The tall and stately sexton's daughter, who had drowned her child in a well, and who did not pay the least attention to what was going on around her, and was pacing to and fro, like a maniac, in the free space of the cell, abruptly and rapidly turning around whenever she reached the wall.

All these types stand before us as if hewn of stone and, it may be confidently asserted, have been made immortal by Tolstoi; with all their surroundings they will live in the minds of men just as long as the creations of the greatest masters of literature, such as Dante who, with his genius for imagination, created a picture of Hell itself.[8]

We have seen that what strikes Tolstoi now and what struck him many years ago in the trial is that the court is not at all concerned with the one subject which is the reason for its existence; Tolstoi feels that the questions asked by the judges leave unrevealed the "live essence of things," in fact "they exclude the possibility of ascertaining that essence." The question is whether this attitude is the result of a preconceived idea or whether there are features in real trials which supply a basis for this generalization? To understand Tolstoi correctly in this matter, it will be well to imagine ourselves as witnesses of an old time ordeal. Ordeals were a procedure by which the guilt of the defendant and his liability to punishment were determined. One kind of ordeal was the test by water and fire in which the guilt or innocence of the defendant was determined by his success or failure in snatching a stone from a vessel of boiling water without burning his arm.

This method of a trial appears to us like a cruel farce, an occupation which can be seriously indulged in by lunatics alone. And yet, this is the way by which men thought at that time that they could arrive at the absolute truth. It is surprising that men expected to arrive at the truth from absolutely irrelevant facts, for what relation is there between a man's guilt or innocence, and the greater or smaller sensitiveness and recuperative power of the skin on his arm? But, as matter of fact, at that time men did not trust their own intellects, and expected God to guide them through the agency of ordeals; the more astonishing fact is that men at that time were interested exclusively in the mere guilt or innocence of the defendant; granted his guilt, they cared nothing about the motives which had induced him to commit the crime, and without even thinking of that, they felt themselves justified in inflicting cruel punishments and even death itself upon their neighbor. The very same thing and in like degree strikes Tolstoi in the trial of today. Tolstoi, like Bellamy in Looking Backward, sees the present with eyes of the future; and he sees it not as a dream, but with a realism which for us is conceivable only in contemplating past events. Tolstoi sees in

[8] An even more striking example of Tolstoi's ability to understand and portray the emotions of men in prison can be found in Kryzhov's story of the execution of one of his fellow prisoners. It is made up of simple phrases. It is too long to cite here. "They choked their lives out of them with ropes" it ends.

a crime no evidence of the evil will of any man; without a remainder he divides the motives into their constituent elements; the bad example of environment, the lack of forethought in dealing with our neighbors, the venality and the selfishness which underlie our modern economic structure. Let us cite Nekhlyudov's meditations about the boy who stole mats:

"It is evident that this boy is not a peculiar criminal, but a simple man (all see that), and if he has turned out to be what he is, it is due to the conditions which breed such men. And therefore it is obvious that, in order not to have such boys, one must try to do away with the conditions under which such unfortunate creatures are produced. If only a man could be found," thought Nekhlyudov, looking at the lad's sickly, frightened face, "who would have taken care of him when from want he was taken from the village to the city, and would have attended to his want; or even when in the city, after twelve hours' work in the factory, he went with his older companions to the inn—if a man had been found then, who would have said to him, 'Don't go, Vanya, it is not good!' the lad would not have gone, would have not gotten mixed up, and would not have done anything wrong.

"But no such man who would have pitied him was found, not a single one, when he, like a little animal, passed his apprenticeship in the city, and, closely cropped in order not to breed vermin, ran his master's errands; on the contrary, everything he heard from his master and companions, during his sojourn in the city, was that clever is he who cheats, who drinks, who curses, who strikes, and who is dissolute.

"And when he, sick and deteriorated by his unhealthy work, by drunkenness and debauch, in a stupor and beside himself, as though in a dream, walked aimlessly through the city, and in his foolishness made his way into a barn and took perfectly worthless mats away from there, we did not try to destroy the causes which had led the boy to his present condition, but expect to improve matters by punishing this boy!— Terrible!"

Maslova's crime, for instance, taken in connection with her life's history, shows clearly by what imperceptible steps man approaches a criminal career under the modern social conditions. Maslova, the daughter of a dairy maid and a gypsy, was first befriended by her mistresses, then dishonored by Nekhlyudov; later she went from house to house as a servant. Her transformation into a prostitute is quite natural. Prostitution and crime are the twin evils of society; they have a common origin and are closely associated and intertwined with intemperance. The murder of Smyelkov, the wealthy merchant, is a fatal result of his seeking pleasure in a brothel—which is protected by the law—and in the hotel where the attendant and the maid, both accessories of Maslova's alleged crime, are eager to satisfy their generous guest's immoral propensities. By nature, Maslova is a good and a kind being. The realism of the novel is heightened by its unusual beginning, when Nekhlyudov, guilty of having wrecked her whole life, becomes, on top of that, a participant as juror in the cruel legal injustice of which she is the victim.

In his analysis of the prison population Nehklyudov generalizes in the following manner:

Finally, the fifth category was composed of people before whom society was much more guilty than they were before society. Those were the outcasts who were dulled by constant oppressions and temptations like the boy with the foot-mats and hundreds of other people, whom Nekhlyudov had seen in the prison and outside of the prison, whom the conditions of life systematically lead to the unavoidable act which is called a crime. To such people belonged, according to Nekhlyudov's observations, very many thieves and murderers, with some of whom he had during this time come in contact. In this category he, having closely examined the matter, counted also all those corrupt and debauched men whom the new schools call a criminal type, and the presence of which in society is regarded as the chief proof of the necessity for criminal law and punishment. These so-called corrupt, criminal, abnormal types were, in Nekhlyudov's opinion, nothing else than those other people, against whom society had sinned more than they had sinned against society, but toward whom society was not guilty directly, but against whose parents and ancestors society had sinned long ago.

It is clear, therefore, that crime needs to be studied as a social phenomenon only to the extent that it is a reflection of the social evil which generates it. Tolstoi proclaims that crime is a punishment to society for the prevailing venality, the indifference of neighbors to each other, and the general moral rottenness; society is punished through the person of the criminal against whom it is obliged to protect itself and whom it must take

care of. Every new crime is a new indication of a social evil the existence of which is proved by the crime; every crime is an outgrowth of the sins of society. The criminal is like a shell which gathers into its various twists and folds the sounds that are around it, far and near, and reflects them all blended into one peculiar noise. Tolstoi, with his great soul aching for the miseries of his fellow beings, perceived that the modern criminal trial is built on principles diametrically opposed to those explained above, and one can hardly fail to see that the method of handling a case in court was bound to touch in a rough manner a sore spot in Tolstoi's soul.

A dramatic illustration of the inefficiency of a criminal trial is found in the irrelevant nature of all that is ascertained about Maslova during her trial; her real past, which is well known to one of the jurors, Nekhlyudov, remains sealed. The discrepancy between real life and its appearance from the evidence is so great, that Nekhlyudov's intimate knowledge of the truth has the sole effect of hindering him in the performance of his duty.

The phrasing of the questions submitted to the jury especially surprises Tolstoi. The unfortunate verdict in Maslova's case is, in the last instance, a result of the jurors' lack of comprehension of the meaning of the questions and the significance of a few words which they should have included in their verdict. By neglecting to say, "Yes, but without intent to kill," the jury unwittingly convicted Maslova of intentional homicide. The final verdict was not due to a consensus of opinion among them but to a series of circumstances: first, the presiding judge, who had taken a long time for his summing up, had forgotten to mention a point that he always explained, namely, that the jury might, in answering the question, say: "Yes, but without intent to kill"; secondly, because one of the jurors, the colonel, had been telling a long and tedious story about his wife's brother-in-law; thirdly, because Nekhlyudov had been so excited that he had not noticed that the proviso "without intent to kill" had been omitted and had thought that the phrase "without premeditation" annulled the verdict; fourthly, because another juror, Peter Gerasimovich, had left the room when the chairman read over the questions and answers; and, most important of all, because everybody had been tired and anxious to be released and therefore willing to agree to any decision which was likely to bring the matter to a conclusion.

It is essential, however, to appreciate the fact that, by making a legal error the basis of his novel, Tolstoi does not intend to criticise merely our criminal procedure which makes it possible for innocent persons to be easily convicted.

But in describing the muddled form of the question as presented to the jury, Tolstoi does not wish to show how bad it is to neglect the provisions of Section 760 of the Code of Criminal Procedure, but to demonstrate the futility of what the jurors are doing, even when the questions are properly formulated.

Tolstoi thinks that criminal trials sin not in methods of procedure, but in fundamental principles.[1] The very essence of a trial is, according to Tolstoi, the result of utter indifference of man to his neighbors and of his selfish desire to protect his sacred person and his property, no matter what outrage upon his neighbors that might involve. This is why one gains the impression from Tolstoi's description of a trial that all that is done in court professedly for the purpose of finding the motive of the defendant's past actions and of deciding his fate, really has no organic connection with the defendant's past which has led him to his crime, nor with his future which depends on the verdict; the trial is one thing and the verdict another; no close relation exists between them.

Tolstoi is astounded when he finds that, after all, the modern court seeks to

[1] Togantsev, the presiding officer of the court of appeals of St. Petersburg, says: "The starting point of a criminal inquiry is the fact of the crime with all its surroundings, which determine the character, the 'corpus delicti,' the conditions and the legal significance of the deed: the evil will of the doer may be revealed by these circumstances, but it is not the business of the court to consider anything which may have an interest as throwing light on the social and economic significance of the deed, or on the peculiarities of a certain 'milieu' or class to which the defendant belongs, but has no value in determining the just penalty for a deed. A court is not called upon to reveal and explain social evils and maladjustments, but justly to apply the law."

establish the same fact which the Inquisition attempted to ascertain through torture, namely, the bare fact of the defendant's participation in the crime. It was thought in former days that that could be established with the greatest degree of certainty through the defendant's own confession, and when other methods failed this must be secured by tortures. Now, it is believed that the trained mind of the judge is able to gather the truth from the evidence, circumstantial and oral, of the defendant's action and behavior, and the judge can now dispense with the confession. But the aim of the trial is, in the final analysis, the same as that of the Inquisition, namely, to prove that a certain evil deed has or has not been committed by the defendant. The difference is one of method and not of purpose. Tolstoi does not consider that the important question is whether or not the accused has committed an evil deed, but granted the deed, what were the reasons for the defendant's criminal inclinations, what is the real cause of the social disease of which the criminal is a symptom and a manifestation?

A proper culmination of the senseless structure known as criminal procedure, Tolstoi sees in the court of appeals. In that court the fate of the victim of the crime and of its perpetrator is not considered at all, for the judges occupy themselves with utterly purposeless mental gymnastics, and their ultimate decision is not even a result of these mental exercises, but the consequence of certain considerations of policy, or of the chance mood of the judge. Consequently, the exact observance of the rules and regulations of this phase of legal procedure, which is embodied in a special institution, appears to him like a strange comedy which is the less justifiable because, after all, the fate of living human beings depends on its decisions. If the methods of procedure of a trial had really been conducive to the solution of the problem raised by the crime, it would have been reasonable to insist on a strict observance of all the rules; that would have been as important as the insistence on correct multiplication, factoring and extraction of roots in the solution of a problem in mathematics. But the verification of the methods of the trial, of the order of examination of the witnesses, the admission or rejection of documentary evidence, etc., had no object, for nothing depended on these things; the decision of the court was not the answer to the problem presented by the case nor even the logical corollary which could be deduced from the evidence.

In days gone by, lawsuits were decided by means of duels between the litigants or even between hired combatants who were obliged to follow the strict rules devised for such conflicts. Tolstoi is reminded of this custom by the modern trial with its forms and ritual over which the Senate passes final judgment: the weapons have changed—but in Tolstoi's eyes the essence of the trial has remained the same. Does not the outcome of a case even now depend on the cleverness and artfulness of the contestants? The minds of judges in no way differ from the minds of other men. They have their own idiosyncrasies and can be influenced by the same set of facts either one way or the other. The outcome of a case thus depends on the chance mood or the state of mind of the judges, and the cleverness with which the sides appeal to their mental weaknesses and their prejudices. To illustrate, the assistant prosecuting attorney

> delayed the case of the sectarians on account of the absence of an unimportant witness, who was not at all needed, and his reason for doing this was just because the case was to be heard in a court where the jury were an intelligent set, and where it might easily end in their favor. By agreement with the presiding judge, this case was to be transferred to the session in a country seat, where there would be more peasants on the jury and a better chance to end the case unfavorably for the sectarians.

The attitude of men toward criminal retribution is constantly changing. Before John Howard's time, it was not considered proper in England to examine into the causes of deadly epidemics in prisons and other places of detention, because these diseases were interpreted as expressions of Divine wrath which was justly directed against the malefactors.

What a change from this point of view to that of the modern methods of prison administration, with its perfected system of ventilation and its enforcement of all the rules of hygiene conducive to the prevention of the evil effects of confinement! But Tolstoi naturally goes a great deal further in his appreciation of these effects. Nekhlyudov thinks that the death of prisoners from sunstroke, caused by their journey under the burning sun after a winter's confinement, is no better than deliberate murder. His sister, Natalya Ivanovna, exclaimed: "Why killed? Who killed them?" when he said: "Ah, what I have seen today! Two prisoners were killed!"

According to his conviction, the cause of this murder is not in men, but in the system. To cite Nekhlyudov:

> The most terrible thing of this all is that he has been killed, and nobody knows who it is that has killed him. There is no doubt about his having been killed. He was led, like all the prisoners, by order of Maslennikov. Maslennikov, no doubt, sent forth his habitual order, with his stupid flourish signed a paper with a printed heading, and, of course, in no way will regard himself as guilty. Still less can the prison doctor, who examined the prisoners, consider himself guilty. He accurately executed his duty, segregated the weak, and in no way could foresee this terrible heat, nor that they would be taken away so late and in such a throng. The superintendent? —but the superintendent only executed the order to send out on such and such a day so many enforced labor and deportation convicts, men and women. Nor can the officer of the guard be guilty, whose duty consisted in receiving a certain number of prisoners and delivering the same to such and such a place. He led the parts according to the regulation, and he could not foresee that such strong men as those two whom Nekhlyudov had seen would not hold out and would die. Nobody is guilty—but the people have been killed by these very men who are innocent of their deaths!

Tolstoi sees in such incidents the proofs of the fact that even now prisoners are being dealt with in the primitive spirit of revenge. He contends that, while divided into several phases, the essence of the revenge which is now in the hands of authority and which formerly was in the hands of the injured parties has remained the same, only that the tortures have been spread out in space and time.

Torture inflicted with pincers is no longer practiced during the preliminary examination or at court. But men are still tortured by being deprived of their liberty and by the hardships of prison life when they undergo their punishment, and the essence of retribution is still seen in the painful sensations of the culprit. It would indeed be conceded by most that a system which reformed the criminal without causing him pain would be preferable to the modern one, and, if devised, should be adopted in its place. But such a system, say the critics, is impossible and is contrary to the very nature of the thing, and all efforts in that direction are as futile as the seeking by self-taught mechanicians for eternal motion. But to Tolstoi this is no answer; with the realism with which we view the present, he conceives of an entirely new order of things. In this special field a man looking from the standpoint of the future back to the present can find plenty of examples of times when the radical changes later happily achieved seemed absolutely inconceivable. Let us look into the treaties by Judge Jeronimus Christoph Meckbach, published in June in the year 1756. This book contains scientific and practical explanations and directions to the adminstration of tortures. In paragraph five the author says with firm conviction that, while it is a pity to subject men to the tortures described in that section, and while a man who could invent a system of torture which would force criminals to confess without causing them pain would be worthy of a high reward, yet all this is a dream and a utopia equal to the discovery of a "perpetuum mobile," and judges must practice the existing system and observe that the pain inflicted to their victim be gradually increased as the milder forms prove to be ineffective.[1]

Some readers saw in Tolstoi's work a caricature of the Russian courts in particular. But Tolstoi's view of modern criminal justice would have remained the same had he described an English or American prison to Nekhlyudov. He pictures the members of the central govern-

[1] Richard W. Wrede *Die Körperstrafen bei allen Völkern von den ältesten Zeiten bis auf die Gegenwart*, pages 351-363.

ment in St. Petersburg with souls paved with asphalt, smooth even impenetrable, without the smallest aperture through which a living emotion could penetrate. Their attitude is voiced by the governor-general who refused Nekhlyudov's request to leave Maria Pavlovna with the dying Kryltsov, even though she was willing to marry him for the purpose. The lower officials have souls paved in a rougher manner; the pieces do not fit together perfectly, and real emotions can more easily penetrate through the openings. This recalls the opening sentence of the novel:

> No matter how people, congregating in one small spot to the number of several hundred thousand, tried to deform the earth on which they were jostling; how they paved the earth with stones, that nothing might grow upon it; how they weeded out every sprouting blade; how they smoked up the air with coal and naphtha; how they lopped the trees and expelled all animals and birds—spring was spring, even in the city.

An example of less self-control but of the greater responsiveness in the lower officials may be found in the memorable incident of the officer of the guard and the prisoner who was carrying in his arms the girl left him by his wife, who had fallen a victim to typhoid fever in Tomsk. The expression of unrestrained anger in that instance soon gave way to the demands of human sympathy, and after beating a prisoner for daring to criticise the officer's actions, the guard finally gave in and let the father go without manacles and carry his girl.

To Tolstoi the penal system blindly does its work without noticing that it makes men do things to which their very natures are opposed. No less than the horrors of confinement and exile, the separation of husbands and wives, of parents and children, are unavoidable incidents of the system, and are of such common occurrence that we often forget their cruelty. Not so Tolstoi: he reacts to all these things with the freshness of a man coming from another planet.

To Tolstoi they are inevitable results of the very existence of criminal retribution. In his eyes punishment is the most flagrant of crimes; a crime, not similar to those for which transgressors are tried, but a crime of human society itself. Tolstoi is firmly convinced of this, but in his all-forgiving soul he ascribes this crime of humanity to its blindness: the penal institutions are practicing cruelty over man, but no one is directly to blame for their operations.

Novelists and dramatists have pictured to us the souls of individual criminals in such a manner as to make their depravity and cruelty appear fatal, so that their responsibility, in the sense of criminal retribution, is out of the question; such are the various types, different and yet alike in their common irresponsibility—Macbeth, Richard III, Franz Moor, Raskolnikov. Tolstoi has done the same thing in regard to the whole penal system with the distinction that no individual's blindness is brought out, but the blindness of the collective soul of society. Just as novelists and dramatists represent their heroes as the victims of their selfish instincts, neglecting all but their own selves, so Tolstoi pictures criminal justice in its inner essence as the sordid and soulless defense on the part of society, as a whole, of the selfish emotions of the individual. This social institution, which is supposedly intended to work for the common good and to guard common safety, is in reality the very apotheosis of egoism and brutality. This institution not merely creates selfishness, but also fosters it; it makes a recognized institution out of that brand of human sympathy which finds expression in revenge, a sympathy which hardens one against all fellow feeling for one's neighbor, whose misfortunes, sufferings and ignorance are the causes of his criminality; a sympathy, indeed, fed exclusively by the selfish motive of guarding one's safety at whatever cost to one's fellow man.

Tolstoi, in seeking the salvation and regeneration of humanity, concentrates all the force of his intellect and his loving heart on this institution, the very existence of which renders impossible to his mind any normal relations of man to man. Criminal tribunals as a social institution are in a class by themselves; of all the judicial and administrative institutions, the criminal tribunal alone is directly concerned with the development of

social instincts among citizens, that is, with the curbing of selfish impulses among them: the court says, do not kill, do not offer violence, do not rob a man of liberty, etc.; all other institutions approach the matter indirectly. And this institution, in the final analysis, makes a dogma of the very thing it pretends to combat. The penal system in its present form is not merely an unsuccessful attempt calling for reform, not one of the means to an end, but a suicidal institution, the very existence of which, according to Tolstoi's conviction, renders impossible a moral basis for social relations

Tolstoi, as a reformer, does not propose, of course, to destroy the present system, but to enlighten humanity about its moral aberrations; without a conscious and a willing change toward sincere love and sympathy for one's neighbors, there is no salvation for society. Men must cease to judge one another, individually or socially. This does not mean that they must cease from analyzing each other's actions and motives. Quite on the contrary, analysis must become more universal and comprehensive, and in that sense men must judge and be judged more than ever, but men must judge, not in order to condemn, but to understand and help one another. The point is not to forgive, but fully to understand. A change must come not by way of a revolution, at least not a social nor a political revolution, but by way of a complete recasting of man's view of life, the enlightenment of his mind and the purification of his heart of all ignorance and ill will. To accomplish that we must not remove ourselves from those whom we accuse of sin, not guard ourselves from them by means of prison walls, but we must approach them and enter into their midst. The spiritual qualities of sympathy and unselfishness must win the battle over bodily interests which generate ill will and revengefulness.

This is the real Resurrection.

Tolstoi's work in the field of penology may be compared to that of John Howard. Howard's main work, The State of Prisons in England and Wales, is characterized by Spassovich in the following manner:

> This work is very remarkable in its way; one of the most important productions of the eighteenth century, it was written by an author who was neither a scholar nor a man of letters. Never before had a descriptive book, full of statistics, as objective as an account book, and avoiding all expression of personal feeling, had a like success in England, and not with specialists, but with the general public. The book deserved its success by its unusual simplicity, in which the truthfulness of the author is apparent.

This work of Howard's, as well as all his other writings, had a great significance and a powerful influence on prison methods. Yet "Never," says Spassovich, "did he ask himself the momentous question of the logical foundation of the right to punish. Punishment in his eyes needed no justification, it was an integral part of the divinely ordained order of things." A hundred years later it is still possible to find in a civilized land such methods of handling criminals as are described by Tolstoi. In this respect the novelist has a great advantage; the abundance of personal feeling makes every reader live through all the events of the novel. An artist alone could succeed in making us love the man who wears stripes. Many authors have discussed and are now writing about the futility and the cruelty of punishment. Tolstoi has thrown new light on the matter by connecting the futility and cruelty with the very essence of the criminal tribunal. Old observations have, in this manner, gained a new significance.

Tolstoi's thoughts in regard to criminal trials seem strange to us because we consider them as the outgrowth of society's struggle with the criminal, and a struggle that can be no different. But to Tolstoi an accepted viewpoint is no dogma; he thinks and what is more he feels wholly without respect to the established order whenever it deviates from the precepts of universal kindness.

Every conception or dream of a different manner of handling criminals is met by the argument that the desire for revenge is so ingrained in man that he insists on seeing his offender punished, and that this insistence on criminal retribution is one of the bulwarks on which the entire social structure rests. To Tolstoi this bulwark is not essential, and the de-

mand for torture of the offender is not a fundamental trait of man. For example, the history of criminal law establishes the fact that bloody revenge was invariably followed by a period when the feelings of an offended party and his clan, as well as the demands of the authorities, were satisfied with a payment of a fine for the offense without the infliction of any pain on the offender; a regular tax existed for various crimes, and the payment of the tax took the place of bloody vengeance in criminal trials.

Often a negative attitude toward criminal punishments is met by the query: What shall be put in their place? From Tolstoi's viewpoint this reply merits no consideration. If someone discovered that quinine, for instance, not only did not counteract a specific disease of the organism but made it worse, could there be found a man who would insist on the continuation of the use of quinine against fever until a new remedy be discovered? And, finally, we must keep in mind that Tolstoi is not examining so much into the conditions which may lead a man to kill his neighbor, as into the unnaturalness of the state of affairs which forces one man to say to another about his neighbor: "Here, put him away, destroy him!" and yet, figuratively speaking, every criminal sentence does just that, and a death sentence does it literally.

That which we have been accustomed to canvass in two dimensions, Tolstoi has proved possessed of three. Punishment which follows crime, not in the natural order of things but according to the sinful foundations of modern society, calls for an executor. And thus the judge who pronounces the verdict, the policeman who guards the defendant, the jailer who keeps him under lock and key, and the executioner who kills him, all of them collectively become this executor, in spite of the fact that they attempt to placate their conscience each by placing the blame on the other. This is the new dimension discovered by Tolstoi in the problem of crime and punishment. The momentous question is not the success or failure of various kinds of penalties, but the moral effect of punishment on those who pronounce the verdict and those who carry it out.

History is not made by the intellect, but by emotions. Tolstoi's crusade against criminal repression is strong, not in arguments proving that it has never achieved and does not now succeed in the destruction of crime, but in the feeling of sympathy it arouses toward the victims of repression; punishment is not the outcome of a deep and sane view of life, but an undignified and morally infantile manner of handling one's neighbor's liberty, health, and existence. It is enough to say that under the influence of this novel no man will be able to see, without pain, a passing transport of prisoners with their chains, their handcuffs and other sad appurtenances. All men will feel the moral sickness bordering on physical, which was experienced by Nekhlyudov in prison, in the transport station, and on all such occasions. This in itself is a great reform; the shape which these new feelings will take in life are secondary considerations. What exists must do so no longer; what will take its place is another question.[1]

The Resurrection proved that Tolstoi has no equal in the ability to evoke sympathy, love, and humane aspirations in the heart of man. Its chief value is in the kind feelings it evokes. The part which The Resurrection will play in combating penal slavery will no doubt be similar to that played by Harriet Beecher Stowe's novel in the abolition of Negro slavery. Tolstoi's task is a heavier one; he attacks an institution which is everywhere considered normal and necessary, whereas Mrs. Stowe was indignant at a practice which was condemned as a disgrace by the entire civilized world.

At the end of the novel is the inscription: "Moscow, December 12, 1899." One can hardly deny that, in the manner suggested here, this work of Tolstoi's, which Russia may proudly call her own, and which appeared at the very close of the last century, is one of the most remarkable, if not the most remarkable, book of the nineteenth century.

[1] There are at present strictly scientific works, based on abstract theories, which take a negative attitude toward the existing penal system; such is the fundamental two-volume study by Professor Varga: *Zur Abschaffung der Strafknechtschaft*, which demands the immediate abolition of punishment and proposes in its stead a specially organized system of guardianship.

JANE ADDAMS'S TWENTY YEARS OF INDUSTRIAL DEMOCRACY[1]

GRAHAM TAYLOR

To be identified with the life and lot of the working world is the religious passion of Jane Addams as it was of Leo Tolstoi. This master motive of his later years began to possess her whole life from her sixth year. The first, and perhaps the only pride of her life, of which she was conscious as she emerged from her babyhood, was in being a miller's daughter. The first appeal to her imagination from the larger world was in playing in her father's old mill. The one personal possession which she coveted first and most was the "miller's thumb." "I believe," she writes, "I have never since wanted anything more desperately than I wanted my right thumb to be flattened as my father's had become during the earlier years of a miller's life." She would rub between her thumb and fingers the ground wheat as it fell from the millstones in the childish hope of acquiring this trade mark of her father's craft and toil. She took measures to secure on the back of her hands "the tiny purple and red spots which are always found on the hands of the miller who dresses millstones." While her father was to her "the most imposing figure, in his Sunday frock coat, his fine head rising high above all the others as he taught the large Bible class in the left hand corner of the church, next to the pulpit," yet she was "consumed by a wistful desire to apprehend the hardships of his earlier life, in that faraway time when he had been a miller's apprentice."

Her first-remembered and oft-repeated dream was of a responsibility resting upon her to make a wagon wheel.

> The next morning would often find me, a delicate little girl of six, with the further disability of a curved spine, standing in the doorway of the village blacksmith shop, anxiously watching the burly red-shirted figure at work. I would store my mind with such details of the process of making wheels as I could observe, and sometimes I plucked up courage to ask for more. "Do you always have to sizzle the iron in water?" I would ask, thinking how horrid it would be to do. "Sure," the good-natured blacksmith would reply, "that makes the iron hard." I would sigh heavily and walk away, bearing my responsibility as best I could, and this of course I confided to no one.

It was to this capacity to be possessed by a great purpose, which thus early disclosed itself in her experience, that the scenes and events of the working world through which she subsequently passed, appealed so powerfully. The first of these appeals, which proved to be the most prophetic of all, came to her in her tenth year, on a day when she caught her "first sight of the poverty which implies squalor, and felt the curious distinction between the ruddy poverty of the country and that which even a small city presents in its shabbiest streets."

> I remember launching at my father the pertinent inquiry why people lived in such horrid little houses so close together, and that after receiving his explanation I declared with much firmness when I grew up I should, of course, have a large house, but it would not be built among the other large houses, but right in the midst of horrid little houses like these.

The next and most potent appeal which the poverty of the workers or the workless ever registered in all her deep experience, became the turning point in the career of her whole life. By a prophetic coincidence, it came from that same East End of London whither Arnold Toynbee went from Oxford University to be the forerunner of that first social settlement which still bears his name. There she received "an ineradicable impression of the wretchedness of East London, and also saw for the first time the overcrowded quarters of a great city at midnight." She thus reproduces, with all its terrible realism, the lurid scene which burnt itself into her memory:

[1] Twenty Years at Hull House. By Jane Addams. The Macmillan Company, New York, 1910. Pages 462. By mail of THE SURVEY, postpaid, $2.50.

A small party of tourists were taken to the East End by a city missionary to witness the Saturday night sale of decaying vegetables and fruit, which, owing to the Sunday laws in London, could not be sold until Monday, and, as they were beyond safe keeping, were disposed of at auction as late as possible on Saturday night. On Mile End Road, from the top of an omnibus which paused at the end of a dingy street lighted by only occasional flares of gas, we saw two huge masses of ill-clad people clamoring around two hucksters' carts. They were bidding their farthings and ha'pennies for a vegetable held up by the auctioneer, which he at last scornfully flung, with a jibe for its cheapness, to the successful bidder. In the momentary pause only one man detached himself from the groups. He had bidden in the cabbage, and when it struck his hand, he instantly sat down on the curb, tore it with his teeth, and hastily devoured it, unwashed and uncooked at it was. He and his fellows were types of the "submerged tenth," as our missionary guide told us, with some little satisfaction in the then new phrase . . . They were huddled into ill-fitting, cast-off clothing, the ragged finery which one sees only in East London. Their pale faces were dominated by that most unlovely of human expressions, the cunning and shrewdness of the bargain hunter who starves if he cannot make a successful trade, and yet the final impression was not of ragged, tawdry clothing nor of pinched and sallow faces, but of myriads of hands, empty, pathetic, nerveless and work-worn, showing white in the uncertain light of the street, and clutching forward for food which was already unfit to eat.

Perhaps nothing is so fraught with significance as the human hand, this oldest tool with which man has dug his way from savagery, and with which he is constantly groping forward. I have never since been able to see a number of hands held upward, even when they are moving rhythmically in a calisthenic exercise, or when they belong to a class of chubby children who wave them in eager response to a teacher's query, without a certain revival of this memory, a clutching at the heart reminiscent of the despair and resentment which seized me then.

Under the stress of this well-nigh overbalancing inrush of the working world's deepest woe, there also appears in Miss Addams that rare capacity to see the other side, to restore the balance of judgment, and to retain the sense of perspective. Reversing Arnold Toynbee's injunction to "study history with present problems in mind," she studies present problems with history in mind. For while she shared the horror with which the heart and conscience of the English-speaking world reacted at The Bitter Cry of Outcast London, she at once discerns this single impression to be, "of course, a most fragmentary and lurid view of the poverty of East London, and quite unfair." And she adds:

I should have been shown either less or more, for I went away with no notion of the hundreds of men and women who had gallantly identified their fortunes with these empty-handed people, and who, in church and chapel, "relief works," and charities, were at least making an effort toward its mitigation.

So far from making an unbalanced partisan of her, this gruesome scene, and many another witnessed in her European sojourn and in the early part of her subsequent American experience, "did not, curiously enough, in anywise connect with what was called the labor movement, nor did I understand the efforts of the London trades unionists, concerning whom I held the vaguest notions."

This natural tendency to see both sides and to defend the right of each to freedom of thought and speech, has not only never forsaken Miss Addams, but has rather emphasized itself in her actions and utterances through the years. Throughout these reminiscences of all the storm and stress through which she has steered a straight course, her readers share the privilege of her intimate friends in actually seeing her trying to hold the scales of justice even. By her vigilant effort to do so, she was safeguarded on the one hand from any subserviency to wealth, and on the other hand from any slavish loyalty to labor. Within the compass of a single page, this independence appears in reasonably accounting for the business man's distrustful dislike of the type of mind capable of "social enthusiasm;" and likewise in repeating her rejoinder to a workingman's prediction that she would be subsidized by millionaires, that

while I did not intend to be subsidized by millionaires neither did I propose to be bullied by workingmen, and that I should state my honest opinion without consulting either of them.

This she has consistently continued to do all these years, at any and every cost to herself or to Hull House. In evidence of this firm stand she has taken, we may cite, as she does not, every one

of the long series of Chicago's greatest strikes through which she has passed, as between the upper and nether millstones which, like the "mills of the Gods," grind "exceeding fine." Her graphic description of these irrepressible conflicts are as sympathetic interpretations of the interests and attitudes of each side as they are of the rights of the public, that third and greatest party to every industrial difference, which, always and only, she seeks to represent. But with what delicacy and difficulty this stand has been taken and maintained only those fully realize who know the personal and social relations involved. The cleavage wrought by the Pullman strike, which is more than intimated in these pages, has not yet healed and can only personally be felt. It is no wonder that from the scenes of sorrow in her own and others' circles she sought the peace of an hour's truce, by walking far through the strike-bound streets of Chicago to St. Gaudens's statue of Lincoln, her father's friend and her own great mentor, that she might breathe in again through the atmosphere of that great presence the "charity toward all" which tolerates "malice toward none." Thus girded anew in the spirit, she sought to steer that precarious course between those whose servility was begotten by paternalism, and those whose arrogance grew with absolute power; between the semi-beneficence of the model town and the ten-day clause in every householder's lease; between the human rights of ten thousand unorganized American working people and the sympathetic strike of the American Railway Union, which threatened to tie up the highways and mail of a continent; between unswerving loyalty to law and order and the dread and distrust of superseding civil authority by military force.

In the teamsters' strike of 1905 we see her sitting in the mayor's office a long Sunday afternoon, talking first with aggrieved workingmen and then with outraged employers, all the while conscious of the paralyzing power of a new and corrupt industrial conspiracy between the teamsters' union and the team owners' association, to whose co-conspirators in the executive offices of both organizations the whole strike was due.

How unswervingly her ethical insight and steadfastness steadied and steered her passion for justice is strikingly shown by the consistency maintained between her school girl essay and the mature conclusion of her fiftieth year. As a school girl she wrote:

> Those who believe that Justice is but a poetical longing within us, the enthusiast who thinks it will come in the form of a millennium, those who see it established by the strong arm of a hero, are not those who have comprehended the vast truths of life. The actual Justice must come by trained intelligence, by broadened sympathies toward the individual man or woman who crosses our path; one item added to another is the only method by which to build up a conception lofty enough to be of use in the world.

As tested by many later experiences, "this school girl receipt" is verified by this maturest conclusion:

> . . . . certainly employers, trades unionists and arbitrators were all convinced that justice will have to be established in industrial affairs with the same care and patience which have been necessary for centuries in order to institute it in men's civic relationships, although, as the judge remarked, the search must be conducted without much help from precedent. The conviction remained with me, that however long a time might be required to establish justice in the new relationship of our raw industrialism, it would never be stable until it had received the sanction of those upon whom the present situation presses so harshly.

Underlying this passion for social and economic justice there is to be discerned on every human leaf of this book of life a still deeper sense of the need of sympathy and suffering, in order to interpret and reconcile those at variance with each other. So far, however, from considering this suffering of sympathy as a stern necessity, its moral beauty is exalted in quoting the conclusion of an amateur labor drama for which the hero willingly forfeited his life:

> It's the side that suffers most that will win out in this war—the saints is the only ones that has got the world under their feet—we've got to do the way they done if the unions is to stand.

In this spirit she cheerfully accepts the inevitability of suffering cruelest mis-

understanding in making the effort to which a social settlement is committed, "to understand and as far as possible alleviate the present industrial system which thwarts our ethical demands not only for social righteousness, but for social order."

That in this effort it should be drawn into fellowship with the local efforts of trades unions is most obvious. This identity of aim apparently commits the settlement in the public mind to all the faiths and works of actual trades unions. Fellowship has so long implied similarity of creed that the fact that the settlement often differs widely from the policy pursued by trades unionists and clearly expresses that difference, does not in the least change public opinion with regard to its identification. This is especially true in periods of industrial disturbance, although it is exactly at such moments that the trades unionists themselves are suspicious of all but their "own kind." It is during the much longer period between strikes that the settlement's fellowship with trades unions is most satisfactory in the agitation for labor legislation and similar undertakings. . . .

Nevertheless the reaction of strikes upon Chicago settlements affords an interesting study of social psychology. For whether Hull House is in any wise identified with a strike or not makes no difference. When "labor" is in disgrace we are always regarded as belonging to it and share the opprobrium. . . .

There is, however, a certain comfort in the assumption I have often encountered that wherever one's judgment might place the justice of a given situation, it is understood that one's sympathy is not alienated by wrongdoing, and that through this sympathy one is still subject to vicarious suffering. . . . Perhaps that sort of suffering and the attempt to interpret opposing forces to each other will long remain a function of the settlement, unsatisfactory and difficult as the rôle often becomes.

There is a touch of pathos in her world-wide quest for fellowship in this pursuit of the Holy Grail. She lingers pensively over her youthful hope in starting out upon this search:

that somewhere in church or state are a body of authoritative people who will put things to right as soon as they know what is wrong. Such a young person persistently believes that behind all suffering, behind sin and want, must lie redeeming magnanimity. He may imagine the world to be tragic and terrible, but it never for an instant occurs to him that it may be contemptible or squalid or self-seeking.

I vaguely hoped for this universal comity when I stood in Stonehenge, on the Acropolis in Athens, or in the Sistine Chapel in the Vatican. But never did I desire it as in the cathedrals, Winchester, Notre Dame, Amiens.

However, this larger "comity" failed to be realized in history or experience, she gratefully appreciates the "warm fellowship gradually developed between the various settlements in Chicago, founded upon a likemindedness resulting from similar experiences, quite as identity of interest and endeavor develop an enduring relation between the residents of the same settlement."

It was the yearning for such "fellowship" that led her at the age of twenty-five, all alone, with "no outside pressure pushing me toward such a decision," to receive the rite of baptism and become a member of the Presbyterian Church in her native village of Cedarville.

I was conscious of no change from my childish acceptance of the teachings of the Gospels, but at this moment something persuasive within made me long for an outward symbol of fellowship, some bond of peace, some blessed spot where unity of spirit might claim right of way over all differences. There was also growing within me an almost passionate devotion to the ideals of democracy, and when in all history had these ideals been so thrillingly expressed as when the faith of the fishermen and the slave had been boldly opposed to the accepted moral belief that the well-being of a privileged few might justly be built upon the ignorance and sacrifice of the many? Who was I, with my dreams of universal fellowship, that I did not identify myself with the institutional statement of this belief, as it stood in the little village in which I was born, and without which testimony in each remote hamlet of Christendom it would be so easy for the world to slip back into the doctrines of selection and aristocracy?

It is to "a certain renaissance going forward in Christianity" in which she thus confesses to have been so early caught up and so long borne on that she attributes the origin of the social settlement. It is "the wonderful fellowship, the true democracy of the early church that so captivates the imagination."

The spectacle of the Christians loving all men was the most astounding Rome had ever seen. They were eager to sacrifice themselves for the weak, for children and for the aged; they identified themselves with slaves and did not avoid the plague; they longed to share the common lot that they might receive the constant revelation. It was a new treasure which the early Christians added to the sum of all treasures, a joy hitherto unknown to the world—the joy of finding the Christ

which lieth in each man, but which no man can unfold save in fellowship.

These early Roman Christians received the Gospel message, a command to love all men, with a certain joyous simplicity. The image of the Good Shepherd is blithe and gay beyond the gentlest shepherd of Greek mythology; the heart no longer pants, but rushes to the water brooks.

From the maze of interests and influences, outreaching and introspections, achievements and experiences, which are wonderfully interwoven in this simple story of an extraordinarily human life, we have selected and put together the outermost and the innermost:—her struggle for democracy in industry out in the open and her heart's deepest synthesis in fellowship with the Father and with fellowmen in the kinship of the spirit. For the outermost and innermost, and everything in between, are thus shown to be, not detachable parts that can even be considered or understood apart, but constituent elements of character, inextricably identified with each other and exquisitely blended in the unity of a simple, single-hearted personality. This is the charm of the story,—as it is of the life that has more than lived it. So luminous is the life that its fine literary expression is unconsciously overlooked in viewing the vision. There is art in both, but never artifice; art so artistic that it always conceals its arts by being unconscious of them. So naturally are widely separated events and experiences associated that the earlier and later illuminate each other. The recital of vividly concrete incidents and the mature, philosophical reflections which suggest each other are so identified as to be one and the same unbroken flowing tale. To those near enough to read between the lines the delicate reserves are as unfailing as the touch is firm at the most sensitive nerves of the story. The silences, which pass over without a word some of the most fascinating scenes and vital experiences that too closely involve others' suffering to be spoken of, are as impressive as the frankness and fearlessness with which Miss Addams lets other facts, chiefly involving herself, speak for themselves. In this heart-made volume—and in its original illustrations, home-made book—she talks with her friends and communes with her own heart, without the slightest breach of privacy or suspicion of egotism. Like the life it suggests more than it exhausts, Miss Addams's Twenty Years at Hull House will illuminate, interpret and inspire many more lives than will read the volume from any one of the many points of view at which it will make vital contacts with a multitude of very different people.

A NATIONAL HEARING FOR SCIENTIFIC MANAGEMENT

PAUL U. KELLOGG

If the old time Tailors' Guild of London Town had decided to raise prices because of the shortage of a medieval wool crop, had been met by a popular protest, and the protestants had suddenly whisked out from behind a curtain what purported to be a modern sewing machine, as a sole and sufficient argument against the necessity for paying an extra sovereign for their smalls—why, that would have been a prototype of the situation confronting the attorneys for the railroads of the Atlantic Seaboard, at a hearing Thanksgiving week in Washington, before the Interstate Commerce Commission.

The occasion afforded a national platform for the exponents of what has been christened scientific management; which to its leaders and disciples marks a change in industry comparable only to the change from hand tools to machines, and which, if it realizes only a small part of the results claimed for it, will profoundly affect modern conditions of life and labor.

When a majority of the railroads of the Eastern classification territory pro-

posed to increase freight rates, they raised several issues of direct concern to those interested in social welfare. In testimony introduced in their behalf, it was contended that operating expenses have increased faster than gross revenues, because of the recent advances in rates of wages; expenses which have been further augmented by acts of Congress providing for safety appliances, increasing the employer's liability in case of accident to trainmen, and limiting the excessive hours to which some crews in the past have been subjected. In the future, even more than in the past, these demands for increased earnings, shortened hours, sure compensation in work-accidents, and lessened overstrain, will be live issues in labor negotiations and in legislation; and if they cannot reasonably be met in any other way, they would warrant an increase in the public's shipping bill. On the other hand, such raises in freight rates would render more acute than ever the problem of livelihood for wage-earners in all industries.

In this situation the public has been content, apparently, to leave its interests in the hands of the shippers, and the shippers have been floundering in a rather bottomless ruck of arguments as to traditional rates, injury to particular trades or production centers, overcapitalization, discrimination, etc. As attorney for the traffic committee of the Commercial Organizations of the Atlantic Seaboard, Louis D. Brandeis has introduced a daring and entirely new line of defence. President McCrea of the Pennsylvania had testified that with the reduction of grades, and the increased hauling capacity of locomotives and cars, the limit of efficiency and resultant economy is practically reached. This was Mr. Brandeis's point of attack, and he marshalled before the commission a group of production engineers, efficiency experts, manufacturers, contractors and functional foremen who told of the application of scientific management to machine shops and factories, steel works and paper mills, cotton mills, bleacheries, printing, book binding, construction and engineering work. In his opening statement Mr. Brandeis said in part:

> To these declarations of despair involving a vicious circle of ever-increasing freight rates and ever-increasing cost of living, we oppose the gospel of hope. As an alternative to the practice of combining to raise rates and hence to increase prices, we offer co-operation to reduce costs and hence to lower prices . . .
>
> We shall show you how scientific management, when applied to the simple operation of loading a railroad car with pig iron, increased the performance of the individual worker from twelve and one-half to forty-seven tons; how, when applied to shovelling coal it doubled or trebled the performance of the shoveller. How, when applied to the operations of a machine shop, it developed, in certain operations, increases ranging from 400 to 1,800 per cent. How, when applied to brick laying, the day's accomplishment rose from 1,000 to 2,700 bricks.
>
> The fact that the railroad business is subject in its accounting to the requirements of this commission makes it possible for the commission to require that each company ascertain and report to it the simple ultimate unit cost of each operation in every department of the railroad. The further fact that the railroad business is practically non-competitive makes it proper to publish these costs, and to give to each railroad the benefit of knowing the lowest elementary unit cost of each operation attained by any railroad, and how it was attained. What is needed as a basis of comparison is the ultimate unit cost, the cost of turning a wheel, the cost of laying a tie or a rail; and even that relatively simple operation must again be separated into its ultimate simple elements. . . . With the ascertainment of the lowest existing costs, the study must be made whether there is still waste time and effort involved in the best existing method of performing that particular operation, and after such waste has been determined and eliminated, there remains the wide field of research for a better way. . . . Under the present management increasing wages means increasing costs. Under scientific management increasing, greatly increasing wages means a lower cost. For under the influence of science not only does labor produce more, but there is a great saving in materials, and smaller expenditures for plant and equipment.

In fine, Mr. Brandeis's contention is: that the burden of proof is upon the railroads to show that there is no way of meeting their new labor budget and remain solvent other than by increasing freight rates; that before the commission approves the pending rate increase it shall demand comparative unit costs, and shall itself make an investigation of railroad industrial practice and the possibilities of scientific management as applied to it; otherwise the government will be joining in an endless antiphony of higher rates, higher prices, higher wages and higher rates.

His brief may be considered no more than a shrewd move, when the shippers had found other cudgels of no avail, to cross the swords of the expert traffic men with the equally tempered blades of a remarkable group of industrial inventors and managers, whose ingenuity has been directed towards eliminating waste and increasing production along all lines, in much the way that the traffic men have clipped minutes from their time tables increasing the speed of their fast trains. A broader view is to regard Mr. Brandeis not so much as attorney for a particular interest, as a man big enough to seize a big opportunity, matching up the needs of the shippers and the creative genius of the scientific managers with the demands of the railroads, and invoking the power of the Interstate Commerce Commission to apply to one great group of industrial enterprises, with which the public comes into authoritative contact, principles which the industrial statesmanship of the future may apply to all.[1] The immediate step urged upon the Interstate Commerce Commission would lead to a continued service to the railroads of the country, and through them to the people, similar to that of the Department of Agriculture in demonstrating soils and breeding stock.

It has been only within the past four or five years that the pioneers in scientific management have formulated their principles into anything approaching a system. They go back to the early work of Fred. W. Taylor of Philadelphia, who gave up his course at Harvard because of bad eyes and got a job as laborer in the Midvale Steel Works. After he had worked three years as foreman, he made up his mind that life wasn't worth living if the methods and spirit of work in vogue were the standard of civilization. One of his early accomplishments was with yard labor:

> The shovelling was done as it had always been done. Taylor said that for the ordinary man, there must be some law governing shoveling which nobody had developed; there must be a certain number of pounds which a man could carry on his shovel most efficiently, without wearing himself out. He made his observations as any scientist would, and ultimately discovered twenty-two pounds to be the amount which a man fitted for the job could handle. He then thought that if twenty-two pounds was the right amount, he must have a shovel with which a man could, without waste of effort, carry that weight. If the shovel were heavier than necessary, he would not be getting the full benefit of what he did in carrying it back and forth; nor would the same shovel do for coke which did for coal. When Taylor got that far, he considered the conditions under which the man shovelled. If he shovelled lump coal, the place for him to shovel from was the ground, but if he shoveled lime, he should take that from the top of the pile, because then he would not need a smooth hard surface to scoop from; and it took less time and effort to begin at the point nearest him. In this way he increased the efficiency of the shovelers about 200 per cent, working the same number of hours and working no harder, but paid about sixty per cent above the ordinary day wages.

One of the most interesting pieces of testimony was that of Frank B. Gilbreth, a well known contractor, who under Mr. Taylor made a motion study of bricklaying:

> Bricks have been laid about the same way for 4,000 years. The first thing a man does is to bend down and pick up a brick. Taylor pointed out that the average brick weighs ten pounds, the average weight of a man above his waist is 100 pounds. Instead of bending down and raising this double load, the bricklayer could have an adjustable shelf built so that the bricks would be ready to his hand. A boy could keep these shelves at the right height. When the man gets the brick in his hand, he tests it with his trowel. If anything this is more stupid than stooping to pick up his material. If the brick is bad he discards it, but in the process it has been carried up perhaps six stories, and must be carted down again. Moreover, it consumes the time of a $5 a day man when a $6 a week boy could do the testing on the ground. The next thing the bricklayer does is to turn the brick over to get its face. More waste: more work for the $6 boy. Next what does the bricklayer do? He puts his brick down on the mortar and begins to tap it down with his trowel. What does his tapping do? It gives the brick a little additional weight so it will sink into the mortar. If anything this is more stupid than any of the others. For we know the weight

[1] This is in line with Mr. Brandeis's known work for manufacturing concerns in New England, in line with his long-expressed view that we are entering upon an era of social invention in industry which will eclipse the last century of mechanical invention and in line with two other Washington commissions which have brought him before the public nationally—the Oregon nine-hour-for-women case in which the Supreme Court's decision marked an era in health and factory legislation and the case for conservation involved in the Pinchot-Ballinger inquiry. He is acting as unpaid attorney in this freight rate case.

of the brick and it would be a simple matter in industrial physics to have the mortar mixed so that just that weight will press it down into the right layer. And the result? Instead of having eighteen motions in the laying of a brick, we have only six. And the men put on the work to try it lay 2,700 with apparently no more effort than they laid a thousand before.

Equally significant was the testimony given as to the Brighton mills, Passaic, where a study of the operations of the looms was made under Gant. The first point of attack was to eliminate the things which delayed the weavers. Their warp often ran out before new was at hand: they used twenty boxes of filling a day, and there was no routing which brought the supply automatically to them when needed. These things meant friction and lessened output. With these preventable delays eliminated, a motion study was made of the operators. Next, a new system of payment was established which guaranteed them the day rate they had formerly earned, and offered a bonus for output in excess of the standard time; this rate never to be cut. Instructors were employed to show the weavers how to manipulate the machines in line with the new motion studies, and a special bonus was paid to these instructors if they brought their men up to standard. The scientific staff of these mills, as distinct from its operating force, today includes a head scientific manager, a planning clerk, a routing clerk, store clerks, timekeepers and investigators, the latter trained men, several of them graduates of textile schools, who do nothing but study the processes at every point. The accompanying colored sheet, published through courtesy of the *Engineering Magazine*, shows the experience in the weave shed during the transitional weeks—how an increasing number of the weavers were broken in to the new methods with the help of the instructors, and how, once they had mastered the new way, their bonus became a fixed entry. This sheet was exhibited as illustrating one of the most important features of the system—the individual work record of each man, which puts him clear of the caprice of the foreman.

The illustrations cited are rudimentary. They show the angle from which the scientific manager is approaching his problem. In the space available it is impossible to go into the testimony offered as to scientific management—or even to outline its major phases[1]—its inventions which embrace men as well as machines, its inter-locking of processes and routing of materials, its care in tool equipment, its scientific rate-making, its shifting of emphasis from the "line" to the "staff" organization of industry, from the "man higher up" to the "last man" on the job, its utilization of the economic motive, its creation of understandable work units, its elimination of friction and of the wear of work.

There was challenge in this testimony, not merely to railroaders, but to those who approach industrial conditions from the social viewpoint. If scientific management presents the potentialities of the change from hand tools to machine production, it presents some of the dangers of that change. It has already developed ethics as well as method; its success may well jeopardize those ethics, at the hands of cruder men than the group who have fought its earliest battles against what skepticism and inertia as only they know. Repeatedly, Mr. Brandeis gave human viewpoint and the "labor" bearings of some bit of testimony of one of his witnesses, in a way which showed that in the development of the social content of this new science of works management we should look for some of its most important advances in the next few years. They would give backing for Mr. Brandeis's feeling that "there is nothing in the whole field of sociology to compare with it for hopefulness." For if we are in truth to have such another intensive, resistless reordering of industrial life, as the economists called the Industrial Revolution, we should not only have statesmanship to forestall its miseries, but to socialize the benefits which would come from great leaps in production.

[1] A literature is already building up on this subject. Within the past six months Emerson and Gant, who were the leading expert witnesses at Washington, have set forth their principles and rare funds of suggestive experience in two volumes of the Works Management Library published by the *Engineering Magazine*. Efficiency as a basis for operation and wages, by Harrington Emerson, and Work, Wages and Profits: Their Influence on the Cost of Living, by H. L. Gant.

THE COMMON WELFARE

TO ARBITRATE GARMENT STRIKE

Just when the strike of 40,000 garment workers in Chicago[1] seemed to have settled down into a grim struggle of endurance, with little hope of early termination, the great third party to every industrial dispute—the public—succeeded in its efforts to bring both sides together in a plan of arbitration. This came about, significantly, through the intervention of the official representatives of all the people—the City Council of Chicago. At its meeting on November 28, Alderman Merriam introduced a resolution pointing out that the whole city—her citizens and her business—was suffering enormous loss through the protracted strike of so many workers, that many policemen were required to protect the public and guard the struck shops, and that a committee of representative citizens investigating the causes of the strike had found real differences between the parties to it, and provided that a committee of three aldermen be appointed by the mayor "to use their best efforts to bring about a conference of the parties at issue in this strike, to the end that a just and lasting settlement of the points in controversy may be made."

A conference arranged by this committee brought together its own members; Harry Hart of the firm of Hart, Schaffner and Marx, and Attorney Levy Mayer representing that concern; and Samuel L. Landers of the national garment workers' union, President John Fitzpatrick of the Chicago Federation of Labor, Edward Anderson of the local garment workers' union, and Mrs. Raymond Robins of the Women's Trade Union League, representing the strikers. After several sessions the conference reached an agreement on December 3 on a plan of arbitration. This was ratified on December 4 at an executive session of the Chicago Federation of Labor, which had given its complete support to the cause of the strikers. During that and subsequent days the various strikers' meetings were visited by the four conference members representing labor, who explained the terms of the plan and urged its ratification by all.

Wilder in Chicago *Record-Herald.*

THE NON-COMBATANTS.

The arbitration plan provides for a board of five members—two to be appointed by the employers, two by the striking employes, and the fifth to be chosen by these four—with full power to settle all grievances submitted by the strikers and devise a plan of dealing with any which may arise in the future. Their decision is made binding on both parties. Non-union employes are not to be discriminated against. All strikers are to be taken back except those who have been guilty of violence. If a striker seeking re-employment is challenged on that ground and work is refused him and the challenge is not sustained, he is to receive wages from the time of his seeking re-employment.

TERMS OF AGREEMENT

Under the terms of this plan the objectionable feature of the former pro-

[1] See THE SURVEY for November 19.

posed agreement, to which President Rickert of the national garment workers' union assented and which was overwhelmingly repudiated by the strikers, plays no part. This was the specific statement, that the agreement to have a board of arbitration should not be considered as a recognition of any union, that the question of union or open shop should not be submitted to or decided by the arbitrators, and that the open shop should not be considered as a grievance. The present plan thus leaves the way entirely open for the board of arbitration to devise some plan of shop organization or committee scheme involving the principle of collective bargaining. In this respect the employers have entirely abandoned their repeated insistence, that dealing with employes individually is an adequate way of handling all grievances and matters of shop administration, wages and other conditions. On the other hand, under the present plan, the strikers have completely given up their closed shop demand. As in the settlement of the cloakmakers' strike in New York, it is likely that both sides in the Chicago struggle will find some means of providing for collective bargaining without involving the strictly union shop.

The conference has thus far had the participation of the Hart, Schaffner and Marx firm alone among the employers; and even its participation shows a much broader spirit of conciliation than existed two weeks ago when a prominent Boston garment merchant was present in Chicago, who more than anyone else was influential in settling the New York cloakmakers' strike. There he was welcomed in the councils of both sides, and brought Louis Brandeis into the situation as chairman of a joint conference and proposer of the "preferential union shop." In Chicago the union leaders unreservedly conferred with him, but the employers did not appreciate the opportunity to profit by his experience.

The refusal thus far of other Chicago employers to accept the invitation of the City Council committee shows a curiously blind denial of rights to the workers, which even in their response to the committee these employers assume for themselves. The lawyer representing the Wholesale Clothiers' Association and the Wholesale Tailors' Association, in response to the invitation to attend the meetings, wrote:

> In view of the fact that it is the intention of the wholesale clothing and tailoring associations, which I represent, to maintain the open shop wherein competent people may work without discrimination because of their membership or non-membership in labor organizations, I feel that the conference as planned would not be productive of good results.

Similarly, Edward Rose, president of the National Wholesale Tailors' Association, after learning of the expected presence at the conference of a committee representing the garment workers' union, wrote that his organization desired "to avoid a discussion of the present labor situation in our industry with the garment workers." As the Chicago *Daily News* points out:

> Thus it appears that numerous clothing manufacturers, speaking through agents representing trade organizations to which they belong deny to their employes this same right to act collectively through agents of their own selection! This position is not merely untenable—it is absurd and medieval.

As THE SURVEY has stated, the firm of Hart, Schaffner and Marx is much the largest of all the concerns involved in the strike, employing 10,000 out of the 40,000 workers who went out. It is generally felt that if the present negotiations result in a satisfactory agreement in the case of this firm, the other employers will find it necessary to bow to public sentiment and make a similar agreement. It is said to be the purpose of the City Council committee again to invite the employers who have not thus far participated. If they should again refuse, there is little doubt that they will find the feeling of all classes of people in the city overwhelmingly against them.

The end of the strike in Chicago comes just at a time when, according to report, the trouble was spreading to Milwaukee and other cities, where shops were said to be receiving work from Chicago.

THE STRIKERS' LONG STRUGGLE

The Chicago struggle of more than nine weeks' duration has been a severe test for both sides. A conservative esti-

mate puts the loss in employers' profits and workers' wages at over $100,000 a day or a total of about $5,000,000. The situation had developed into a struggle in which questions involving specific grievances and methods of adjusting them, points of shop administration and even questions of technical consideration in industry, which should obviously be settled on some basis of reason, were to be decided by a test of brute strength—by waiting to see precisely how long it would take hunger and cold to enforce submission. If it became necessary to win the struggle against starvation as a preliminary to a settlement on the basis of reason, there were numbers of people in Chicago willing to contribute to the strikers' resources, whatever their impressions might be of the merits of the controversy.

Organizations and interests which thus extended help involved a wide range, from parlor gatherings in the homes of the well-to-do to the various trade unions of the city. The Chicago Federation of Labor voted an assessment on trade unionists at work, and this was made effective as the individual organizations met and acted in accordance with that resolution. The Teachers' Federation contributed from its members and from funds raised by the energetic leaders. A special issue of the *Daily Socialist*, presenting in detail the cause of the workers, was sold on downtown street corners by girl strikers, this bringing in more than three times as much money as a similar scheme in New York during the cloakmakers' strike. Various organizations on race lines were formed to provide relief for striking countrymen. At a meeting of the Citizens' Committee the needs of thousands of babies in strikers' families were pointed out by Mrs. Joseph T. Bowen, who started a milk fund with a contribution of $1,000.

The religious forces of the city also co-operated. In some churches small envelopes "for the relief of the strikers," or "to help the garment workers win their strike," were distributed in the pews, collection being made after a talk on the strike by the minister or someone sent from the Women's Trade Union League. The ministers' organizations of several denominations went on record in favor of better standards of wages and hours and the principle of collective bargaining. Committees were appointed to inquire into the facts of the strike. The city-wide evangelistic campaign, recently conducted by the Rev. J. Wilbur Chapman, also directed attention to the situation. Many organizations, notably the State Federation of Women's Clubs, adopted strong resolutions endorsing the strikers' cause.

Among efforts toward a settlement, the City Club, through its committee on labor conditions, published a bulletin printing in full the terms of the "preferential union shop" agreement[1] which settled the cloakmakers' strike in New York, and of the "basis for settlement" which ended the shirtwaist makers' strike in Philadelphia. While not urging that the exact terms of either of these be applied to Chicago, the committee pointed out that the essential feature in both is the recognition, in different forms, of the principle of collective bargaining, although neither involved the so-called "closed shop."

The Chicago Woman's Club held a large meeting at which a number of speakers discussed the situation and read a letter written by Jenkin Lloyd Jones to the employers, urging them to make further efforts to meet their employes at least half way by conceding their right to be represented collectively. On all of these occasions, and in many other ways, the Citizens' Committee helped inform the people of Chicago about the situation.

Throughout the long struggle there were many instances of violence, yet compared with many other labor difficulties the record was not as bad as it might have been. On the whole, and in view of the desperate circumstances to which some of the strikers were reduced, Chicago may be considered fortunate to have escaped without more serious disturbance.

Meetings of strikers were simultaneously held every day in several halls. Speeches by leaders kept them informed

[1] See THE SURVEY for September 17.

on all developments, including the distribution of relief. These meetings did much to preserve self-control and enable all to keep cheerful together.

CLAUSE 79 IS HELD UNCONSTITUTIONAL

By a decision rendered by Justice Bischoff in the New York State Supreme Court, Clause 79 of the Page law has been declared unconstitutional. Medical examination of convicted prostitutes has been discontinued in the Night Court for Women and the sentences imposed by magistrates have now no relation to the presence or absence of venereal disease.

Justice Bischoff's decision applies only to Clause 79 and does not disturb the operation of the remainder of the Page law, which radically changed and improved the administration of minor courts in New York, added new juvenile courts and the Court of Domestic Relations, and will shortly provide civilian probation officers, chosen by civil service test and paid by the city.

The decision holds that

> the attack upon this statute upon the theory of discrimination between men and women is not well founded. It is unquestionably an enactment having for its aim the safeguarding of the health of the inhabitants of the state, and the matter is fully within the police power. Ground of argument is not lacking that the danger from the spread of disease by women of the class in question is greater than the danger existing from the disease in the case of men, and that the present regulation is necessitated as a step distinct in its nature from a corrrective measure which may be directed to the diseased condition of males.

The claim of class legislation because the law applied only to one sex is thus denied by Justice Bischoff. The unconstitutionality, he held, lies in the relation of the medical inspection to the court procedure. The decision reads:

> There is clearly merit, however, in the contention that the statute directs the detention of the accused, without due process of law, in that the nature of the sentence, after conviction, is made to depend upon the report of a physical examination without the opportunity of a hearing upon the facts entering into the report. The conclusion of the examining physician is made binding upon the court. The report is presented to the magistrate "and if it *thereby* appears," says the statute, that the prisoner is afflicted with the disease in question, "the magistrate shall commit her to a public hospital," for a period which, in the magistrate's discretion, may be one year—a period greatly exceeding the maximum time of detention prescribed for the same offense in the absence of a physician's report. Since the magistrate cannot hear the accused as to the corrrectness of the facts stated in the report, but is bound thereby, the penalty attaching to conviction of the offense is made to depend upon an independent inquiry out of court, with the result that the convicted person is deprived of the benefit of due process of law.

The decision thus rests entirely on a legal point. It is stated that an appeal will be taken to the Appellate Division by the corporation counsel.

It is understood, also, that the matter will come before the Legislature of 1911 in one or more bills which will aim to provide medical inspection and treatment after commitment, a more general use of Bedford Reformatory for Women and an effort to hasten the establishment of a farm colony for women, for which preliminary steps have already been taken.

It is understood, also, that the new legislation will attempt once for all to remove prostitutes from the workhouse, which offers no opportunity for moral or physical improvement, and to do away with short term sentences and repeated small fines. These are conceded to have as bad an effect upon prostitutes as a recent number of THE SURVEY (October 5, 1910) showed them to have upon confirmed drunkards. During the term the Page law has been in operation—a little less than three months—two women have been sentenced to the workhouse for five days each, twelve for ten days each, five for fifteen days each, and so on through a list of varying short terms in marked contrast to the Bedford term, which has no limits except the maximum of three years.

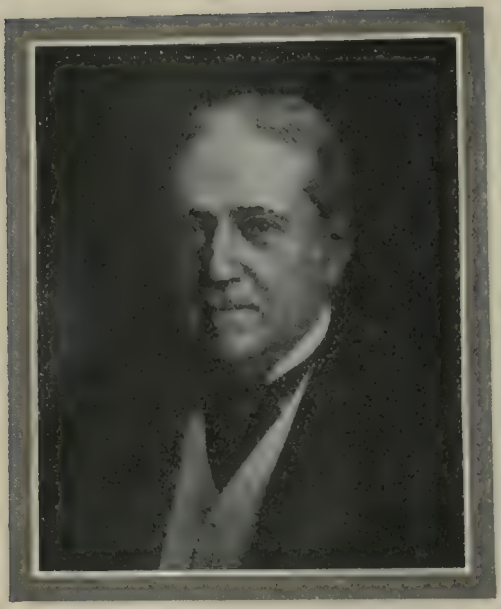
Little can be expected of any new law, it is held, which does not in some way urge magistrates to use Bedford to its capacity—and then to increase the capacity. From September 1 to November 24, the term the Page law was in effect, 284 women were convicted. 14 were placed on probation, 17 were fined, one was sent to Bedford, one was sent to the Magdalene Home, 51 were sent to the

workhouse for definite—usually short—periods, 120 to the workhouse for an indeterminate period of not more than six months, and 80 to the hospital. That is, four-tenths of one per cent of the whole number were sent to the institution which the state established and equipped up in the Westchester Hills, for the specific purpose of setting women offenders on their feet, teaching them habits of industry and returning them to society with a fair chance of success.

OPENING THE DOORS OF THE LITTLE RED SCHOOL HOUSE

We have the public school plants, but most of us no more appreciate what it means to have these possessions than the people in Europe before 1492 appreciated what it meant to have the earth. There was a whole hemisphere of incalculable wealth and opportunity about which they knew nothing. And in the public school plant there is a whole hemisphere of value unrealized, undiscovered, by those who think of it simply as a building for the education of children with the additional use of an occasional evening school.

This opening paragraph of the report of the school extension committee was the chief feature of one of the most interesting sessions at the Buffalo convention of the National Municipal League.



The report defined a social center as "the public building or group of buildings and grounds which form the capital of the neighborhood, the focal point of its common educational, recreational, political and social life, the institution which is to the neighborhood or smaller division of a city as the civic center is to the city as a whole." The complete and fully equipped social center has nowhere been realized, but the testimony of many speakers from many cities showed the progress made toward it. Prof. Charles Zueblin and the Rev. Samuel M. Crothers traced its ancestry from the primitive gatherings of free men in ancient Greece and Rome and Palestine down through the *folk mote* of northern Europe, the old New England town meeting and the citizen gatherings in the little red schoolhouse in the colony of Massachusetts Bay. Professor Zueblin showed that such uses of the schoolhouse are not novelties—"they are the twentieth century revival and expression of that democratic spirit which has been vital at intervals for more than two thousand years."

The committee placed great emphasis upon the use of school buildings for non-partisan gatherings for public discussion. Henry C. Campbell of Milwaukee and Livy S. Richard of Boston gave testimony from experience, Mr. Richard showing in particular that "the public schoolhouse is the appropriate headquarters for non-partisan politics." Civics may be taught to children by day and to foreign-born adults by night, and the school can be turned into a polling place by a mere installation of voting machines—Buffalo, it was shown, could save $7,500 or more a year by such use—and if the suffrage is extended it would provide a fit place for women to vote.

CALLING THE ROLL

A mere recital of the subjects and the speakers gives an idea of the scope of this promising new movement. The relation of the civic use of school buildings to public service was made up of statements from public officials, including former Governor Hughes, Mayor Gaynor, Mayor Whitlock, Mayor Seidel and various aldermen. Dr. George W. Goler of Rochester showed how the school can be a local health office, L. E. Sterns, its use as a branch public library; Henry M. Leipziger of New York discussed it as a free lecture bureau; Edward W. Stitt of New York, as a recreation center; John Collier of New York, as a center for educational moving pictures; William D. Foulke, as a public art gallery; C. S. Martin of Columbus, as a center for civic festival and holiday celebrations. Charles W. Holman of Dallas outlined social uses of country schools. Clarence A. Perry of the Russell Sage Foundation told concretely of the actual developments in this direction in more than a hundred cities and of the extensive development in eighteen cities—a subject he has covered in a forthcoming book.[1] Other speakers

[1] Wider Use of the School Plant. By Clarence A. Perry. Russell Sage Foundation Publications. In press. Orders for delivery on publication, in about two weeks, may be sent to THE SURVEY at $1.25, postpaid.

WILLIAM DUDLEY FOULKE.

showed the relation of this socialized public school to the regular school, to home, university, church and settlement and to reform movements.

The session was throughout interesting and inspiring and it will be learned with gratification that the full report of the committee is to be published in book form.

This Buffalo meeting was the first in four years at which the National Municipal League gathered to discuss good city government, without the aid and comfort of the American Civic Association conferring on problems of civic beauty in an adjoining hall. In spite of this division, the attendance was quite as large as at Cincinnati the year before, and there was an advantage in not having to choose between two meetings going on at the same time. It marked the new presidency of William Dudley Foulke of Richmond, Ind., formerly United States civil service commissioner, who takes the place filled for seven years by Charles J. Bonaparte. In his opening address on Conservation in Municipalities, Mr. Foulke called attention to the great value of city property—streets, roads, parks, public buildings—which in private hands would be made to produce an enormous income and should, through proper municipal control, be made to decrease tax burdens substantially. He pointed out another source of city income in unearned increment on land values. Mr. Bonaparte's retiring message laid emphasis on the apparent anomaly, that men will do more for next to nothing than they will for great material rewards—they do not risk their lives or charge in battle in the hope of increased dividends, and in that lies the hope of municipal reformers who are seeking recruits in a tedious, laborious, costly and embittered conflict with powerful, entrenched enemies. The secretary, Clinton Rogers Woodruff of Philadelphia, gave his usual admirable summary of civic progress during the past year.

Space forbids a detailed consideration of the program which was, in fact, a veritable feast of good things. In spite of the absence of the sister body, the program was crowded.

ORGANIZATION OF CIVIC SECRETARIES

Two of the sessions, however, demand at least brief reference. One of these resulted in a new organization, the Civic Secretaries' Committee of the National Municipal League, whose purpose is "to consider questions arising in connection with the organization and methods of work of civic associations." Each member is to make his office a bureau of information regarding all civic affairs in his city if a local organization, and of information within its field of work if a national organization. The chairman is Eliot H. Goodwin, secretary of the National Civil Service Reform Association; the secretary, John Ihlder, field secretary of the National Housing Association; and the treasurer, Addison L. Winship, civic secretary of the Boston City Club. A discussion lasting all of one afternoon brought out the fact that civic organizations may roughly be divided into three classes: one typified by the Boston City Club, which provides a meeting place and seeks to bring together men interested in civic affairs, and by association and contact to stimulate and strengthen

this interest, but to leave the actual carrying out of constructive work to other organizations usually composed of these same men; a second typified by the St. Louis Civic League, the municipal affairs committee of the Grand Rapids Board of Trade and the Pittsburgh Chamber of Commerce, and the Pittsburgh Civic Commission which seek themselves to carry through constructive programs for civic betterment; and a third typified by the Chicago Municipal Voters' League and the Minneapolis Voters' League which concern themselves almost entirely with the records of candidates for public office.

The other notable session was in charge of the committee on municipal reference libraries, with the chief contributions by Horace E. Flack, municipal librarian of Baltimore, and Samuel H. Ranck, librarian of the Grand Rapids Public Library. The committee traced the history of this new form of library work, marked its importance and value and reached the following conclusions: that a municipal reference library should be established in every large city under the control of the public library, located in the city hall and placed in charge of a man selected for merit alone; that it serve not only city officials but the public generally and the press; that it establish subject files concerning health, police and other specific questions; that it maintain a strictly neutral attitude on all questions; that it serve as a repository of city documents and establish an exchange of such documents between cities; that the head of the bureau draft ordinances when called upon to do so. Mr. Ranck emphasized strongly two points—that the library must be free, and that it must reach school children.

PROBLEMS OF PENNSYLVANIA

The second Pennsylvania Conference of Charities and Correction recently held at Altoona was successful in the advertising it gave through the newspapers to the activities of the state's social organizations and the need for certain legislative changes. It was successful also in the inspiration given the delegates by the forceful presentation of facts and figures by speakers of acknowledged authority. It was seemingly unsuccessful, however, in arousing interest in social matters in the conference city. Altoona (and for Altoona read almost any of the smaller Pennsylvania cities) has no associated charities, though steps are now being taken to form one, and to the absence of such an agency for adequate local advertising must be attributed the meager attendance of local people at the conference. Plainly a conference should not be held in a city which is without a well organized center for local publicity.

In his presidential address F. H. Nibecker, superintendent of the Boys' House of Refuge at Glen Mills, discussed an old and mooted question—the Pennsylvania system of state subsidies to private charitable institutions. He believes that private local institutions should be supported locally but that those among them which do work for different parts of the state should have public aid. The discussion which followed placed him distinctly on the conservative side of the controversy.

The state came in for criticism on other scores. One was the practice of keeping girls in county jails under the most seriously objectionable conditions. Martha P. Falconer, superintendent of the Girls' House of Refuge at Darling, backed up her plea for a reformatory for girls and women by a series of letters from Pennsylvania judges and by an address by Katharine B. Davis of the Bedford Reformatory for women, New York, who showed the strong grip her institution gets upon the inmates. Another severe critic was Vance C. McCormick, former mayor of Harrisburg, who showed how the state has spent a million and a half dollars since 1903 on the Institution for Feeble-minded at Spring City, to bring its accommodations up to the utterly inadequate number of 300 boys. The conference committee on defectives estimated that there are 18,000 feeble-minded and epileptic persons in the state, without counting the baffling class of slightly deficient — the "morons" — who were described by Dr. J. H. Goddard of the Vineland, N. J., Training School.

Dr. Joseph S. Neff told how the infant death rate in Philadelphia was reduced thirty-six per cent in five wards in which house to house baby nursing and instruction for mothers were carried on last summer as a demonstration to City Councils of the high returns on money invested in such work. Other evidence on the subject was presented by Dr. J. F. Edwards of the Pittsburgh Department of Health, who showed that one-half of the Pittsburgh babies who die are in families paying a rent of ten dollars a month or less, and three-fourths in families paying fifteen dollars or less; and by Charles F. F. Campbell, general secretary of the Pennsylvania Association for the Blind, who contested the general opinion that midwives are chiefly responsible for improper care of infants, by showing that of 116 preventably blind children born last year two had been attended by midwives and 114 by physicians. There was a strong exhibit on infant mortality which bore its part in making this one of the most interesting sections of the conference.

The failure of child labor reformers and of specialists in industrial education to connect up their programs was brought out sharply by Fred S. Hall, secretary of the Pennsylvania Child Labor Association. He said:

> Because of this failure a great gulf has been fixed between the legislative compulsion secured by one side and curriculum possibilities offered by the other. Into that gulf are dropping each year several hundred thousand boys and girls. If the fifth grade has been completed, and if the boy is also fourteen years old, he is allowed to choose between work and school. But that boy is not at the same time allowed to choose between industrial school work and academic school work. Industrial courses, with but two or three exceptions, are open to him only if he has completed the grammar school—three years farther along.

Jesse D. Burks, chairman of the National Education Association's committee on industrial education, had some timely remarks at the same session on the low grade "dead end" industries where training is not given or required.

> In an age of rapid-fire guns and high explosives, we are sending boys and girls into the field equipped with blunderbusses and wet powder. We are penny-wise in providing for industrial training and supervision of child labor, and pound-foolish in providing houses of detention, reformatories, prisons, asylums and charitable relief.

There were other discussions, no less interesting, on wife desertion under the direction of Charles F. Weller, general secretary of the Pittsburgh Associated Charities, and education on sex hygiene by Edwin D. Solenberger, general secretary of the Pennsylvania Children's Aid Society, and a stirring address by John Foster Carr of New York drawn from his close contact with Italian immigrants.

Next year's conference will be held in Pittsburgh November 14-16. The Rev. R. M. Little, D.D., of Pittsburgh was elected president; Fred S. Hall, secretary, and Edwin D. Solenberger, treasurer. The topics will be the prevention of blindness and the employment of adult blind, the courts and the child, public health, inebriety, the church and social work and state supervision of charities.

STUDY MISSOURI SOCIAL PROBLEMS

With the annual meeting recently held at Chilicothe, the Missouri Conference of Charities and Correction begins its second decade. Within the last year the membership of the conference has quadrupled, an increase which represents a new social interest throughout the state, in part due to the stimulus given by the National Conference of Charities at St. Louis last June; in part, to the reorganization of the conference on a more businesslike basis, and in part, to the wide publicity given to its work by the executive committee.

G. Wilse Robinson opened the sessions with his presidential address on the value of a state conference as a means of laying out broad plans of preventive work. He was followed by William C. Graves of Illinois, who spoke on the Central Administration of State Institutions, and William B. Moulton, president of the Illinois Civil Service Commission, who dwelt on the business advantages of civil service in public institutions.

The second day was made significant by four chief features: the public ex-

hibits, the study of problems of public health, the counseling together of juvenile court officials, and the formation of the State Association of Poor Law Officials. The exhibits consisted of a large display of pictures, diagrams and industrial work of state institutions, loaned by the State Board of Charities and Corrections, and the traveling exhibit of the St. Louis Municipal Commission on Tuberculosis. The section on problems of public health brought out several noteworthy papers, the most valuable perhaps being Dr. Walter H. Fuchs's comprehensive and searching treatment of sex hygiene. Dr. Fuchs described the passage of the social evil law by the Missouri Legislature in 1872, told of the present organization to improve conditions and the need of public education on sex hygiene, explained the nature and extent of the social evil, and closed with a denunciation of the double standard of morals and a plea for the development of an aristocracy of brains and character. Robert J. Newton of St. Louis and Dr. William Porter outlined the method of the campaign against tuberculosis. Dr. M. H. Post and Dr. John Green of St. Louis treated the problem of preventing blindness. In the group meeting of almshouse superintendents, two excellent papers were presented by Prof. T. J. Riley of the St. Louis School of Social Economy and E. T. Brigham of the Kansas City Helping Hand Institute, the former discussing problems of outdoor relief and the latter vagrancy. Dr. Riley's paper was notable for his exposure of the lax administration of outdoor relief in Missouri which fosters pauperism and multiplies degenerates. The meeting was followed by the formation of the State Association of Poor Law Officials, with Dr. Anderson as president and W. T. Cross as secretary.

At another section, under the chairmanship of George B. Mangold of St. Louis, the undeveloped work of child-saving in Missouri was studied. Judge Grimm of the St. Louis Juvenile Court explained the constitutionality of this new agency, and Judge Porterfield of the Kansas City Juvenile Court told of the work done by the boys' farm and the newsboys' hotel in connection with his court. Roger N. Baldwin showed that the logical development of the juvenile court idea means prevention, and the Rev. C. C. Stahmann described the work of the Missouri Children's Home Finding Society. In his committee report Dr. Mangold said that it is time for Missouri to undertake a conscious policy of caring for dependent and neglected children, whether through a state school or by boarding out under the State Board of Charities and Corrections.

The final morning session was made most interesting by the address of Dr. Alice Hamilton of Hull House on the importance of proper physical treatment of the wayward girl. The dominant idea in Dr. Hamilton's talk was the unreasonableness of the old plan of treating this class of girls and the need of their scientific physical regeneration. Major W. L. Chambers, state pardon attorney, explained the new system of paroling convicts from the penitentiary as it is used by Governor Hadley. Mrs. F. W. Baumhoff of St. Louis reported for the committee on placing reading matter in the charitable institutions of the state. The report made by Judge David E. Blair for the standing committee on social legislation included an appeal for adequate support of the State Board of Charities and Corrections, a demand for enlargement of the state colony for the feeble-minded, a statement of the general demand for civil service in state institutions, a request for an increase of the legal rate of county support of patients in insane hospitals, and a plea for a reformatory for young first offenders.

The 1911 conference will meet in Kansas City the second Thursday in November. The officers are: Prof. T. J. Riley, president; Dr. G. Wilse Robinson, Mrs. A. M. Clay and S. M. Green, vice-presidents; William T. Cross, secretary-treasurer. Beside the president and secretary the executive committee includes Mary E. Perry, William Volker and Mrs. J. N. Booth.

HALE JAILS TO THE BAR

One of the best recent bits of descriptive sociology is the definition of the present jail situation in the United States

given by Frederic Howard Wines, statistician of the Illinois Board of Administration of State Institutions, before the Maryland Conference of Charities and Correction at Frederick. What he said of our jails, "satirized by foreigners under the generic term of menageries," applies to almost every jail in every state, but it came with particular force after a report by a reporter of the Baltimore *Sun*, who has stirred the state with a series of articles on the subject. Dr. Wines said:

> No fault can be found with any one jail that may not be found with scores of hundreds of others. There are jails that are too large, and jails that are too small, insecure jails, unsanitary jails, jails without light, jails without heat, jails without ventilation, filthy jails, jails that are not properly governed, palatial jails, and jails that are not fit for occupation, stables, or pigsties. There is not a charge that can be brought against the county jail system which has not been brought, nor one that cannot be sustained. We have used a stereotyped form of construction in American prisons. That is one cause of the prevalence to such an alarming extent of tuberculosis. The atmosphere of our average jail is foul beyond the power of language to describe. Prisons of this sort are propagating houses of criminals.
>
> The abuses of which I have hinted could not long survive if convicted offenders, major and minor misdemeanants, as well as felons, were in the custody of the state instead of county officials. The massing of sentenced prisoners would admit of their classification, and of the introduction of reformatory methods of dealing with them.

The conference was organized in four committees—families and neighborhoods, health and sanitation, children, county homes and county jails, Dr. Wines's address falling in the last. In addition to the papers and discussion of the committees there was a special address at the opening session by William H. Maltbie of Baltimore, who made a keen analysis of the Maryland system of state aid to public and private charities—a subject which was being discussed in the neighboring state of Pennsylvania at almost the same time. Leaving aside the fundamental question of whether or not such aid should be granted and accepting it as a policy to which the state is committed, Mr. Maltbie laid down three fundamental principles for it. First, public funds must be expended for the good of all, which excludes appropriations on denominational, local, racial and special grounds. Second, the state holds its funds subject to a trust which it may not delegate and therefore has no right to give away money for permanent buildings to which it does not hold title, or for maintenance of an institution without a rigid accounting for expenditure. Third, the state is under an obligation to get value for what it spends and therefore its appropriations must be based upon the amount of service rendered. To get effective service the state must work through an expert board with a well-paid staff of expert investigators. Yet, in Maryland today there is a state board, but it is not permanent, its members are not familiar with problems of charity and it has no expert force. "The appropriations violate all of the fundamental principles laid down. They are denominational, they are racial, they are local, they are not always made on merit. We donate buildings to institutions where the state has no control over the title. We donate funds for maintenance and demand no accounting and our appropriations bear no particular relation to the service rendered."

Another striking address was by Joseph B. Baker of Frederick, the president of the conference, who drew a parallel between the movement for conservation of physical resources and for the conservation of human kind.

The papers at the sections were interesting and several struck new notes and brought out points of particular interest to the state. Francis H. McLean of the Russell Sage Foundation showed the need for charity organization work in smaller cities as well as in large. Some of the most degenerate families in the country are found in the smaller communities, he said. Edith Jones Keene of Talbot county, speaking on When Should the Custody of the Child be Transferred from Its Parents and by Whom, precipitated a discussion in the committee on children in which a large number participated and which left the impression that the state must revise its statutes so as to provide a more humane relationship

between child and state and that the state's function in relation to dependent, neglected, defective and delinquent children is in sore need of being more clearly defined. Dr. John N. Hurty of Indianapolis, in a striking address on eugenics, made an appeal to social workers to join with medical men in attempting to give human life its highest values.

The next conference will be held in Baltimore, in the autumn of 1911, with Gen. Lawrason Riggs of Baltimore as president and with but three committees, health and sanitation, Dr. Adolph Meyer, chairman; children, families and neighborhoods, Aimee Guggenheimer, chairman, and state, county and municipal philanthropy, William H. Maltbie, chairman.

PLAN UNIFORM LAW ON ACCIDENT COMPENSATION

Nine states and the United States government were represented at a conference of commissioners on compensation for industrial accidents held in Chicago to discuss the fundamental points which should be covered by legislation, and upon which it is desirable to secure uniform state laws. The conclusions reached by the conference should prove of great value wherever there is a movement to secure employers' liability or accident compensation laws.

The conclusions of the conference as to what a law should cover are:

1. That all employments should be included.
2. That all injuries should be covered irrespective of employers' negligence and of employes' negligence except where injury is self-inflicted for the purpose of recovery—burden of proof that injury was self-inflicted to be placed on the employer.
3. That all persons engaged in the employments should be included.
4. That compensation shall be paid in instalments in the case of temporary disability, and in the case of permanent disability or death by instalments with right to commute after a given time with approval of some public official.
5. That the amount and duration of compensation shall be as follows:
   (a) Temporary disability. Fifty per cent of the impairment of wages; maximum of $10 per week, minimum of $5 per week; or if wages less than $5, then full wages (or 66 2/3 per cent of wages up to $7.50 of wages per week, then 50 per cent of balance until compensation amounts to the maximum of $10 per week, maximum). Payments not to extend beyond period of 300 weeks.
   (b) Permanent disability. Same as temporary disability.
   (c) Partial permanent disability. Fifty per cent of impairment of wages. Maximum of $10 per week. Payments not to extend beyond period of 300 weeks.
   (d) Death.
      (1) Total dependents.
         If orphans, 50 per cent of wages of deceased.
         If widow alone, 25 per cent of wages.
         If widow and one child, 40 per cent of wages.
         If widow and two children, 45 per cent of wages.
         If widow and three children, 50 per cent of wages.
         If widow and four children, 55 per cent of wages.
         If widow and five children or more, 60 per cent of wages.
         If widow, father or mother, 50 per cent of wages.
         Children under sixteen years of age only to be included and only during period they are under sixteen years of age.
         Maximum of $10 per week, minimum of $5 per week or if full wages less than $5, their full wages (or 66 2/3 per cent of wages up to $7.50 of wages per week, then 50 per cent of balance until compensation amounts to $10 per week, maximum). Payments not to extend beyond period of 300 weeks.
      (2) Partial dependents. Fifty per cent of the portion of the wages contributed by the deceased to the partial dependents.
      (3) No dependents. Expenses of last sickness and burial not exceeding $200.
6. That the length of waiting period shall be two weeks, during which period employer shall furnish medical treatment or hospital care to an amount not exceeding $100 in value.
7. That dependents shall not include aliens residing outside the country and illegitimate children are not to be mentioned.
8. That employes shall not contribute.
9. That it shall be permissible for employers to substitute voluntary schemes, provided the voluntary scheme covers all points covered by the law and is approved by some public official to be determined in the law.
10. That the method of determination of controversies shall be by a board of arbitration.
11. That the scheme shall involve compulsory state insurance or if this is not possible compulsory compensation, providing that the employer may transfer his liability by insuring in companies approved by a legally constituted public body or official.
12. That all other laws in conflict shall be repealed.

The United States Employers' Liability Commission, which was recently appointed and consists of Senators Warner of Missouri and Hughes of Colorado, Congressmen Denby of Michigan and Brantley of Georgia, William C. Brown, president of the New York Central lines, and D. L. Cease, editor of the *Railway Trainman,* was represented by Mr. Cease and Launcelot Packer, secretary of the commission. United States Commissioner of Labor Charles P. Neill was also in attendance. Official commissions in eight of the nine states were represented as follows: *Massachusetts,* James A. Lowell, Amos T. Saunders, Magnus W. Alexander, Henry Howard and Carroll W. Doten; *New York,* J. Mayhew Wainwright; *Wisconsin,* A. W. Sanborn and Paul J. Watrous; *Ohio,* James H. Boyd, W. J. Bohr, W. J. Winans and Z. E. Smith; *Minnesota,* H. V. Mercer, George M. Gillette and W. E. McEwen; *Illinois,* Edwin R. Wright, E. T. Bent and George Golden; *New Jersey,* William B. Dickson and Albert A. Snowden; *Montana,* W. L. Holloway. A special delegate, Walter S. Schutz, was present from Connecticut. A special committee of commissioners on uniform state laws to prepare a uniform workmen's compensation law consisted of Hollis R. Bailey, of Boston, chairman, Aldis B. Browne of Washington, D. C., and John H. Wigmore, dean of Northwestern University Law School, Chicago. The conference chose H. V. Mercer, chairman, and Amos T. Saunders, secretary.

ILLINOIS EFFORTS TO SECURE A NEW LAW

The conclusions of the conference should be of great value in Illinois where a state commission, appointed by resolution of the last Legislature to frame a law covering employers' liability and extend compensation, failed to agree. The commission consisted of twelve members, six representing employers and six employes. The bill formulated in the report was supported by all of the members except two who represented especially the sentiment of the Chicago Federation of Labor and opposed the bill because they thought it did not sufficiently do away with the present employers' defences under the common law, such as contributory negligence, assumption of risk and the fellow-servant clause. Four labor men, including President Edwin R. Wright of the Illinois State Federation, supported the bill.

This controversy among the labor members of the commission was carried to the recent Illinois State Federation of Labor convention at Rock Island, where Mr. Wright was re-elected president of the federation and his attitude and that of his three colleagues on the commission was sustained. The convention directed him to appoint a committee of six to confer with employers regarding the introduction at the next session of the Legislature of a bill in conformity with the commission's report.

The convention of the American Federation of Labor in St. Louis passed a resolution on November 22 supporting the policy of the Illinois Federation, thus showing still more clearly that the two labor members of the Illinois commission who did not endorse its bill fail to represent the attitude of organized labor generally. Notwithstanding this, the Chicago Federation of Labor continues to oppose the Illinois bill and is actively trying to bring local unions throughout Illinois to its point of view.

BRICKS WITHOUT STRAW

THE STORY OF AN ITALIAN GIRL AMONG THE STRIKING GARMENT WORKERS IN CHICAGO, TAKEN DOWN VERBATIM BY PROF. KATHARINE COMAN OF WELLESLEY COLLEGE.

I went over to Blue Island and Polk street to Mr. G. one Saturday and asked for work. He asked me what could I do? I said: "Well, I can do shoulders, I can do body finishing and all sorts of work." He said: "Just wait here a minute and I will put you to work." So he came back in a minute and I started to work. In the evening I went to him and said: "Well, Mr. G., do you like my work?" "Yes," he said, "very well."

There were about ten greenhorns who could not talk English at all. I can't speak English very good, but I speak

more than what they could, so in the evening I went to him and I said: "Do you like my work?" He said: "Yes, I like your work very well." I said: "How much are you going to pay me?" He said: "What can you do?" "Well," I said, "I told you, basting, finisher, buttons, all kinds of work." So he said: "Well, I would like to have you for forelady to teach these greenhorns how to work, because these are greenhorns and they can't work very well." So he told me: "You just be forelady and tell them to work more and make me good work." So I said: "Well, all right, but don't you like the work that they do?" He said: "No, they can't work for me now, but you must try and learn them." So I said to him: "If you think they can't do the work, I have some good experienced girls that could do the work right, and I will bring them over in the morning." So he laughed—he stopped and he laughed. He said: "Experienced girls? Not in my shop." "Why, not?"

He said: "I want no experienced girls. They know the pay to get. I got to pay them good wages and they make me less work, but these greenhorns, Italian people, Jewish people, all nationalities, they cannot speak English and they don't know where to go and they just come from the old country and I let them work hard, like the devil, and those I get for less wages." I said: "All right, then, you are the boss and I will do as you say."

So in the morning, Tuesday morning, I started to attend to the girls. So when the girls seen me, they asked me: "You are the forelady?" "Yes." "How much are you going to pay us a week?" So I said: "I am a new girl here, I don't know anything, but I will ask the boss, and I will let you know."

So when it was Tuesday night I went to the boss and I said: "These people want to know how much are you going to pay them?" He said: "Well, don't you know how much?" I said: "I don't know, I am new in the shop, I don't know how much you pay." So he said: "For a finisher, I will give her six dollars a week, and she must finish me up ten coats a day." Now each coat you could sew it in an hour and a half, and that made fifteen hours' work a day. So I answered and said: "Oh, my, they could not do that. Why, I cannot finish myself ten coats in a day, and I am an experienced girl, and how could you expect these people to finish ten coats in a day? So he said: "Well, never mind, that is my price, six dollars a week, ten coats a day, if they want to work. If they don't want to work, I got a lot of greenhorns to come in the shop, why, let them go." I said: "Well, all right, I will speak to the people."

Well, Wednesday morning I told the people, "You must finish up ten coats a day, six dollars a week." Well, these people were all married women, they all had families of small children, some had husbands that were sick, and there was a woman there that had a husband that was blind for two years and besides he was sick in bed, and she was in that condition she could not work, but she had to work in the shop to get fifty cents a day to support her and her husband. So I said, "Well, you must finish up ten coats a day." Those people started to cry. They said: "How can we support our families if we have to do ten coats a day, because we could not do a coat in an hour and a half. How can we do it? It is impossible." Well, I got up and I said, "Talk to the boss." They said, "We cannot make ten coats a day." I said, "All right, I speak to the boss again."

So I went to the boss and I told him, I said: "The people are not satisfied. Ten coats a day, an hour and a half on each coat, you ask them to work fifteen hours a day." He said: "If they cannot finish ten coats a day, let them finish up just as much as they can in the day time, and the rest of the coats they bring home so as to make one day's work. If they cannot finish ten coats a day, bring the rest home and make them in the night time, so they can do one day's work." I said, "They want to be paid piece work." He said, "That is all right. I will pay them piece work." I said, "All right. How much are you going to pay them?" He said, "I will pay them thirteen cents a coat," and that was a little worse than the week work. You had to work an hour and a half on each

coat for thirteen cents a coat, and if they worked ten hours a day they could not make more than fifty cents a day, and I said, "It is too cheap." He said: "I can get all the greenhorns I want to do the work, and I can get them cheap." "All right."

I went to the people and I said, "The boss will pay you thirteen cents for each coat." "Thirteen cents a coat. Are you crazy," they said to me. "Well," I said, "I ain't crazy, but maybe the boss is." They said, "How do you expect us to make fifty or sixty cents a day, how can we do it?" I said: "I cannot help it. That is my duty, I have to tell you."

So these people, they did not know where to go, and they had to suffer and be satisfied with that thirteen cents a coat because they did not know where to go. They did not know how to speak English, they did not know any place to go, any other shop, so they had to keep on there and suffer, and they could not make any more than five coats a day when they worked hard. He wanted fine work and small stitches. He said, "I want work just like a patty cake." He wanted all that work for thirteen cents a coat, and those people make five coats a day.

Well, about a month later this boss came to me and said, "Oh, Clara, I am so sore I don't know what to do." "Well," I said, "The bosses are always sore for one thing or another." He said, "Well, do you know what is the matter with me? The contractor that gives me the work, he cuts me twenty-five cents a coat. What can I do?" I said: "Well, you must ask him again to raise you back again." He said: "Oh, no, he don't want to do it." "Well," I said: "I am sorry for you, but what can I do?" He said: "Well, the only thing to do, I pay thirteen cents a coat for finishing, and that is too much, we must lower it down to twelve cents." I said: "Thirteen cents a coat is too much? You must be crazy. If you would lower the price down to twelve cents, they cannot make it." He said: "If they cannot make it, here is the window and here is the door. If they don't want to go from the window, they can go from the door, and if they don't want to go from the door, they can go from the window. I have lots of greenhorns. I got to make my own living." I said: "Ain't you ashamed? Ain't you sorry to make those people work an hour and a half for twelve cents?" He said: "Don't you care. In the old country they work for ten cents a day, and in America, if they make thirty-five cents a day, they can eat beans and they will have plenty to live on." He said, "You don't understand America. Why you worry about those peoples? Here the foolish people pay the smart." That made me angry and I said, "Well, now the smart people will teach the foolish!"

I said: "I am not going to tell those people twelve cents a coat, they will jump over me if I tell them." He said: "You got to tell them." I said: "No, sir, you tell them yourself. I am just ashamed to tell them." I said: "You are a rich man." He said: "Yes, I am rich, and the poor must stand by the poor, and the rich must stand by the rich." I said: "Well, if you want to do that, you tell them that yourself." He said: "You are forelady, you are supposed to do the speaking." I said: "Well, if I am supposed to do the speaking, then I will not be the forelady, I want to be a working girl, the same as the others, and then I don't speak." So he said: "What do you care for them greenhorns?" "Well," I said: "I am an Italian girl myself. I can speak myself good English, but if I could not, you would do the same thing to me." "Well," he said: "If they don't want to make the coats for twelve cents, let them jump out." I said: "All right, you tell them." He said: "Don't you want to attend to the girls?" I said: "No, I want to be a working girl." He said to me: "Well, what work do you want to do?" I said: "Well, give me work, anything you wish to." "Well," he said: "All right, I will give you week work." I said: "How much?" He said: "I will give you fourteen dollars a week."

I was the best one in the shop, one of the best girls, an experienced girl in all kinds of work. Those people could not do no more work than two and a half to three dollars a week, but I was better, I was a good, experienced girl

and do all kinds of work that no other girl could do. He said: "All right, I will give you week work." So he told them twelve cents a coat and they said: "What can we do for twelve cents a coat? We cannot make no more than five coats a day. How can we make our living?" He said: "Don't you want to stay? Go on, go out of the shop. I will kick you out, one by one, out of the shop."

I was the only single woman there. They were all married women. He said: "I can kick you out." The women got up and said: "Well, you got such a heart, you make us work for twelve cents, you are a rich man. Why don't you give us a cent more, five cents a day more. That is enough for us."

He said to one woman: "A good looking woman like you, maybe you don't need no position. You don't need to work." You understand—I am a young girl, and I cannot explain. "A nice woman like you, if you don't like to work in a shop, you don't have to work, you do something else." So that woman, of course, she had to keep quiet. She understood and she said: "Well, no, I will starve first." "Well," he said: "Get out of the shop." He talked that way to that woman.

Well, then, when he put me to week work—anybody who works for him must make small stitches. He said: "They must be so that the stitches does not show at all." He put me to week work and he said: "I will give you fourteen dollars a week." Of course I basted on shoulders, and if I was to work real fast and real hard that I would not have two minutes to get a glass of water to drink, it took me twenty-five minutes, so in ten hours I could not make any more than twenty-three or twenty-four coats, and I had to work hard to do that.

So the first day I make twenty-four and the second day the same. I could not possibly do no more. I used to go up there a quarter after six and half past six to finish the shoulders, because if I did not have them ready they had to wait for me, and my overtime. I did not get paid for it. So one day there were about fifteen coats laying on the floor and I was the only one basting shoulders and the boss came in and he said: "Clara, are those coats all basted?" I said: "All basted? An hour and a half, fifteen coats all basted; no, they ain't basted." He said: "Do you let them lay on the floor?" I said: "No, but if you don't want them on the floor, put them on a chair." He said: "I thought they were all basted." It was nine o'clock in the morning, and fifteen coats laying on the floor. I said: "I cannot baste a coat in less than twenty-five minutes, no matter how hard I work." He said: "You know that these coats must fly like the leaves on a tree, that is the way you must make the work fly." I said: "My, I cannot do that." He said: "Well, you know the people cannot wait for you, the finisher cannot wait for you, the work must go out." So I said: "Well, get another one to help me if you want the work to fly." He said: "No, I won't have another girl, you got to do it. If I get another girl, you have to baste one hundred coats a day," and I could not do that in a week, so I said: "No, I cannot do it." He said: "Well, you should baste thirty-five coats a day," and I could not baste no more than twenty-four coats if I worked real hard.

Of course, I am a poor girl against a rich man. If I would quit, maybe it takes me two or three days to get another job, and there was a family of five or six persons in the house and I was the only one working, and then I lose two or three days, five or six dollars, and I could not; I had to suffer and take all he said. Every day he comes to me and he said the work must go, and he holler and he use profane words, too, so what could I do? I cannot go to another place to find work because the other places were on a strike. Of course, he was insulting me every day and the other people, too.

So I knew they were striking in all the shops, so I told all our girls, I said: "The first whistle we hear in the window, that means for us to strike. You cannot work for twelve cents a coat, and I cannot baste thirty-five coats in a day, and we will all go on a strike." So one day, it was dinner time, a quarter after twelve, and we hear a big noise under the win-

dow and there was about 200 persons were all whistling for us to come down and strike, so I was the first one to go out and get the other girls to come after me.

So when we went on a strike, he owed me eighteen dollars and a half, and he owes all the people and he would not pay us. I went to him and I said: "Why don't you pay us? I need the money." He said: "I am not going to pay none of you," and he did not do it.

WILLIAM PRYOR LETCHWORTH

ISABEL C. BARROWS
New York

Forty-four years ago I spent a happy day at Glen Iris, the beautiful home of Mr. Letchworth, a day succeeded by many others in "Rainbow-land" as we used to call it, not alone from the brilliant colors that always played about the Portage Falls when the sun was shining, but because the bow of promise was a symbol of the life of the good man whom the Indians called Hai-wa-ye-is-tah—"The one who always does the right thing." He opened the door of hope and promise to many a man and to even more little children. It is not the great ones of the earth, not the learned and wealthy, not the mighty and powerful alone who are mourning because he has gone to his grave. It is the countless little children saved from the almshouse, the innumerable insane rescued from horrible lack of care, the thousands who have to eat the bitter bread of poverty, but at least have decenter places in which to eat it because he designed an improved type of poorhouse; it is the village of epileptics in the Letchworth Colony; it is the neighboring farmers and their broods of children who gather chestnuts in the noble groves; it is the prisoner for whom he improved conditions, who mourn the man just gathered to his fathers like a shock of corn fully ripe.

William Pryor Letchworth, who died at Portage, N. Y., December 1, was one of a large family of country-born children. He was born in Brownville, New York, May 26, 1823. Among the lessons he learned from an excellent mother were lessons in industry, thrift and content and how to do things well. These stood him in good stead during his whole life. As a young man he was engaged in the saddlery and hardware business in Auburn and later in Buffalo. In both places he prospered. Yet even when most successful in amassing money he never forgot the charm of country life and while he was busy with his account books and stock-in-trade he was planning for a home nearer to the heart of nature.

Little by little he acquired land along the Genesee river, till in the course of time he was master of a thousand acres of most varied and wonderful beauty. To this place he retired for rest and recreation.

A severe accident from which he barely escaped with his life turned the current of his thoughts. Once, in describin it, he said in his simple, earnest way, "I thought my life must have been spared for something more than money-making," and accordingly he resolved to use it for a higher purpose. From that time for more than forty years his name was the synonym of unselfish devotion to the most needy. For twenty-four years he was on the State Board of Charities, serving as president from 1878 to 1888 without compensation even for traveling expenses. In 1884 he was president of the National Conference of Charities and Correction, and when in 1900 New York organized her own conference of charities and correction he was the first presiding officer. He was active in forming the Association for the Study and Treatment of Epileptics twelve years ago and was made president. This was in recognition of his work for that class and for his large and valuable book on that subject, a great storehouse of facts collected and arranged by him after visiting many European lands. It is a companion to his work on the Insane in Foreign Countries. For years he was also vice-president of the Prison Association of New York.

Largely through the influence of Mr. Letchworth a bill was passed for taking all children from almshouses and other pauper establishments. He was likewise very influential in having the insane transferred from all sorts of unsuitable

1823—WILLIAM PRYOR LETCHWORTH—1910

places to state care, though he was always eager to give credit for most of that great reform to Miss Schuyler and Mrs. Lowell. Indeed, his chivalrous regard for women was one of his characteristics, a characteristic never more marked than in these later years of invalidism, when he carried on all his vast interests,—business, philanthropic and personal—with the aid of three devoted women—his amanuensis, his attendant and one, the faithful manager of his wide estate. No ladies in the land were treated with greater deference. His beautiful old-fashioned courtesy joined with profound respect made life under the same roof with him a rare boon.

His associates in his own state were always men who aided in every reform. In his national work he had as associates such well-known men as Philip C. Garrett, F. B. Sanborn, F. H. Wines, H. H. Giles, Rutherford B. Hayes, and many more. In Europe his own name was known and honored.

As president of the Buffalo Fine Arts Academy he was able to further the art interests in the city which he loved, and as president of the Buffalo Historical Society he contributed a unique chapter to the historical associations of the state.

Glen Iris,—which runs for three miles along the Genesee river and includes the three wonderfully picturesque Portage Falls and the marvelous cañon with sheer walls rising 350 feet above the river—was once the home of the aborigines. He greatly desired to preserve the relics of this older civilization. The first thing he did was to buy an old council house built of logs which stood on one of the Indian reservations. The logs were marked and taken down and the cabin reconstructed on a portion of his estate. It now serves as a museum of Indian things open to the public and looked after by a caretaker. Beside it is the grave of Mary Jemison, "the white woman of the Genesee," who was taken captive when a girl and brought up among the Indians. To avert the destruction of her grave when city improvements threatened it, he removed the dust and ashes to sleep near the old council house, building a monument to her. He also moved the cabin which had belonged to her daughter to Glen Iris and many old gravestones which had marked the sleeping place of Indians, and which the city ruthlessly had torn up to build culverts, he set up in this happy hunting ground, replacing the culverts at his own expense. There had been feuds between some of the tribes for many years, and Mr. Letchworth, true to his peace-loving Quaker blood, sought to smooth out these differences. When his council house was established he invited representatives from the warring tribes to meet round its open fire and smoke the pipe of peace and bury the hatchet. They came and through his gentle words peace was restored and he was adopted into the Seneca tribe.

Though neither wife nor child of his own ever gladdened his home, Mr. Letchworth made for himself ample opportunity to rejoice the hearts of little children and thus found his own joy. One of his most gracious charities was what he did for convalescent children. A roomy farmhouse was put in order for their reception. He even moved it to a spot commanding a better view. It was furnished with exquisite taste, and pretty pictures suitable for children were hung on the walls. A good man and woman kept it in immaculate order and hither every summer came sick babies with tired mothers and little boys and girls wan from hospital operations. With the unfailing supply of delicious milk, fresh fruit and vegetables, the roses soon bloomed on their cheeks and a rested look came to the eyes of the mothers. On pleasant afternoons the big White mountain coach took them for drives over the hills and through the valley and when they saw Buffalo again they were different beings. It was beautiful to see Mr. Letchworth with this little group of happy children about him.

Other times when it was a benediction to watch him were when the country folk came by the score for picnics, hitching their horses and making a day of it. He walked about among them like a beloved father, enjoying their joy and making all free to share the beauties of nature in the sunlit valley.

Long ago, on an autumn day, there was a tight-rope exhibition across the gorge near Glen Iris. He disapproved of the terrible hazard and refused permission to have it on his estate, but the hundreds who came to watch the feat wandered at will through his gardens and park. When the last train had carried them all away we walked at sunset through the lovely grounds. Across one of the paths lay a beautiful dahlia, uprooted and thrown carelessly away. Said one of his family who did not quite approve of his democratic ways,

"Thee sees now what comes of letting people tramp through thy grounds."

"I would not see it, sister, if I were thee," he quietly replied, and picked up the poor dead thing—one of his favorite plants—and hid it in the woods.

Glen Iris is so beautiful that it has been painted by many an artist and its praises sung by many a poet. A little sheaf of these poems was gathered and printed years ago. In purchasing the place and beautifying it, without ever doing the least thing to detract from its natural charms, he had but one thought, that it should be forever the people's playground and the student's paradise. The rare geologic formation, the abundant flora, the wealth of bird life would attract the latter, while the incomparable

beauty of river and forest appeals to all. More than half a million dollars he expended on this park, denying himself many things he would have liked that he might leave it in good condition. He did not wait till his will should be opened to let the world know what was coming to it. For many years he had enjoyed the thought of the pleasure he was going to bestow and he wisely made this noble gift to the state of New York before his death and had the satisfaction of knowing that it would be accepted, and cared for by the American Scenic and Historic Preservation Society. May that society be able to guard the precious legacy from despoilers of all kinds, including those who for the sake of gain would make of this lovely valley a basin for impounding water to run the wheels of industry. Letchworth Park, with its broad farms, sunny meadows, primeval forests, majestic falls and swift flowing river, should be kept forever unharmed, a worthy memorial of this friend of humanity and lover of the outdoor world.

THE STRIKE OF THE MESSENGER BOYS

H. F. J. PORTER
Industrial Engineer

At the parish house of the Church of the Ascension, Fifth avenue and Tenth street, the rector, the Rev. Percy S. Grant, has for several years held on Sunday evenings, immediately after the service in the church adjoining, what he has called an "after meeting" which is addressed by someone prominent or expert in his field, who presents a subject in a brief way and it is then discussed by the audience.

On Sunday evening last the subject presented was the messenger boys' strike, which had been "on" for eleven days to the great inconvenience of the public and which seemed to be reaching no conclusion.

Two messenger boys, Henry Katz and Jacob Yungswick, fourteen and fifteen years of age respectievly, told in their boyish way what they had struck for. They stated that they were hired to work ten to twelve hours a day seven days a week, but that their hours of service usually ran from fifteen to sixteen, and for this at one and one-half cents a message their weekly wage ran from $3.50 to $5.10. But out of this they had to pay fifty cents a week for the use of their uniforms continuously as long as they were in service, and when they gave up their position had to turn the uniform in to the company before getting their final wage. Besides this deduction, there were fines varying from twenty-five cents to one dollar for being late, the loss of a button from the uniform and infractions of petty rules.

They said they were striking for higher wages, shorter hours and fairer treatment. Their statements were confirmed by George Gelder and William Fruchter of the Central Federated Union, who had organized the boys into the Messengers National Union. They also said that they had solicited a hearing at this "forum" because, with the exception of the *Call*, the socialist newspaper, the press of the city had either refrained altogether from stating the facts involved in the strike or had misstated them.

Mr. Gelder said that the strikebreakers employed by the Western Union and Postal Telegraph companies were obtained from the Bowery Mission and the Y. M. C. A. and excoriated these two "pseudo-Christian organizations" for assisting the corporations to break the state law against the working of boys under sixteen over nine hours per day and over fifty-four hours per week and after seven P. M., and against the exploitation of child labor. These strikebreakers were paid four dollars a day.

One of the worst features of the situation as it existed, Mr. Gelder pointed out, was the environment in which these children were compelled to live and the character of work they had to perform. He said they were not only raised in the atmosphere of Wall street, where they imbibed the gambling spirit, but at night were used as guides in the "Tenderloin" district and at their age, which was more nearly twelve than fourteen, they knew more about the vice of the city than men four or five times as old.

In the discussion which followed the speeches, it was brought out that this strike has had the usual accompaniment of beating up strikebreakers by the strikers and injury to the boy strikers by the police. A number of speakers dwelt upon the lack of interest shown by the press. On the day following the meeting, only a few papers had articles on it, and these were mostly of a desultory character, and emphasized the childish qualities of the boys' speeches without catching their real significance and without stating the facts about the strike which were brought out at the meeting. It also developed that the organizers of the boys had written to both telegraph companies asking for interviews and had received no replies; that they had then telephoned to them and had been informed that the companies would treat only with the boys individually.

There is no doubt plenty of the grotesque and the humorous in the stammering, ungrammatical and broken English of men so anxious and eager in their serious desire to be heard that they are unconscious of everything but their grievance and their remedy. If the newspapers wish to transform themselves into comic dailies, at the expense of the least understood and most pitiable of our citizens, they exhibit a blindness and a brutality for which there will be some sort of punishment, the least of which will be public condemnation.

The strikes that we are hearing about at the present time are perfectly commonplace phenomena, and the corporations whose names are associated with them should be intelligent enough to perceive that they mean nothing more than that the time has come for them to organize their business and their employes into shifts that do not require so many hours a day, for each individual, and to pay wages with some reference to their own profits.

The alternative may be government supervision or government ownership, for such ideas have been fostered in the public mind by recent events. The parcels post is being hastened by the attitude of the express companies. A messenger service under the Postoffice Department has flashed into the public mind because of the messenger boys' strike.

A member of the audience which listened to the discussion of the messengers, said that the meeting made him think of a roundhouse, out of whose many chimneys steam was emitted. Each speaker found himself free to say what he pleased without let or hindrance, which to many of them must have been a surprise and to all a personal relief; while to the listeners the occasion could not help being the source of a wider sympathy, if not a more accurate mental analysis of conditions.

The same gentleman pointed to the advantage that London had in the free expression of opinion it permitted to orators of all sorts of explosive views, who ordinarily are heard in the neighborhood of Hyde Park. The policy of silence and suppression toward uncongenial views, which is that of most of the newspapers and of the Police Department, is not only obnoxious to democracy and an absolute denial of the basis of popular government, which is free discussion, but bottles up and increases a wrath which in a final united explosion might prove destructive.

RAPID TRANSIT AS A SOCIAL WORKER

JOHN MARTIN

Problems of rapid transit and of franchises in cities—problems under active discussion today in New York, Cleveland, Chicago, Detroit, and likely to become acute at any moment in a score of growing places—are usually determined with little regard to the main social purposes which rapid transit should fulfill. The welfare of the mass of the citizens, the rentpayers, is often lost sight of, even when the interests of the taxpayers are properly protected.

First among the aims of officials in determining city policy with respect to street railways, elevated lines and subways should be the distribution of the city's population over an ever-widening area, in order that cheap land, on which workmen's residences may be built, shall

be brought into the market as fast as the city's population increases. If the city be badly provided with good, fast, cheap transit service extending beyond the built-up districts, then population cannot spread, the pressure upon the old housing accommodations increases and rents inevitably rise. Rising rents lead to the construction of tenements and to overcrowding in rooms, with all the ill results on family life and morals which have so often been described. Essential to the prevention or cure of this worst form of congestion, the suffocation of family life in narrow, stifling quarters, is the continuous opening to residence of new tracts within swift and easy reach of factory and office. In medieval times the boundaries of a city were its walls and defences. Nowadays the boundary, equally impassable though less palpable, is the outer limit of convenient transit service at low price. For the rich the automobile and the commutation rates on steam roads widen the possible sphere of residence, until only the time consumed in passage sets the effectual limit to the daily flight to and fro. But the wage-earner, who forms the mass of the city population, cannot possibly afford more than the humble nickel for his ride and for him the range of the trolley car limits the location of a home.

New lines, arranged simply to shuttle the population from one congested district to another, are of secondary importance from the social point of view, though of prime importance to the investor and the franchise seeker. Lines running through districts already occupied will pay from the start, because the traffic awaits the cars; but lines running beyond the existing houses, though their farther stretches may not at first pay money dividends, will immediately, by luring part of the population outwards, return to the citizens dividends of improved health, better living conditions and lower rents.

How slightly these prime considerations are usually weighed is illustrated by the situation in New York today. For several years the Public Service Commission has had new subway and elevated routes under consideration and the strap-hangers have been pleading, threatening, scheming for relief. Many new routes have been approved, among them the tri-borough route with bifurcating limbs stretching far into the unsettled parts of the Bronx on the north and Brooklyn on the south. Upon this route some work is already under way and the Public Service Commission is understood to advocate its completion. But when the plans and specifications for it were issued and bids for its construction invited, behold, they embraced only the parts within the congested areas; they omitted every yard of the sections through undeveloped territories. Fears were expressed that the line, as planned, would not pay, and great was the rejoicing in some quarters when Mr. McAdoo made a responsible offer to operate the lines if certain modifications were made. These modifications, however, make the route still less attractive from the social point of view, because they require the omission of the Brooklyn Fourth avenue section, which will serve a district only partially settled.

Even if the parts of the line be built on which the Public Service Commission has secured bids, so little new land will be brought into use that the effect on housing conditions will be well-nigh negligible; while, should Mr. McAdoo's modifications be made, the effect of the line on rents and housing would be practically nil. Yet the abbreviated plans win support, because people see and feel the discomforts and annoyances of cars jammed to suffocation, of passengers loaded in trains like cattle, and of brutal crushes at bridge terminals,—conditions truly intolerable and crying for relief; but they overlook the indirect consequences of a dearth of transit facilities—rising rents throughout the city, intensified crowding in rooms and worse congestion on blocks.

To secure the maximum social service from transit lines two factors must be considered:

(1). Fare. The flat rate for any distance, usual in America, is more desirable than the rate graduated according to distance, usual in Europe. If the pas-

senger can go a long distance for the same sum as a short distance he will range farther afield for his home. But even the uniform nickel fare is too high for winning the maximum social advantage. Cleveland has demonstrated that a three-cent fare can pay. Great Britain and Belgium offer workmen's cars and workmen's trains at greatly reduced rates (twenty-four miles for four cents and so forth) available in the early morning and late evening. American social workers might well seek reduced fares and improved service instead of payments into the city treasury as the return for franchise privileges.

(2). A low fare on a single route which serves only a narrow district and is soon overcrowded, is of slight social advantage compared with the establishment of numerous routes radiating on all sides of a city so as to bring all the available building land into ready use. Social workers, by insisting that cities arrange for street railway corporations to take the lean with the fat and to run frequent cars at low rates along a number of undeveloped routes together, will serve their clients, the wage-workers, by thus helping to keep down rents, better than they would by later paying part of the rent when it has risen beyond the family means or by starting classes to enforce domestic morality which the living conditions render almost unattainable.

A LABOR PAGEANT

GEORGE B. FORD

The New York Association of Neighborhood Workers has, through its arts and festivals committee, embarked upon a great new work which is bound to be epoch-making. It is trying to bring poetry and music and many of the higher things of life into direct vital touch with the everyday life of the factory and the shop. It would make the workers feel that this poetry, this music is there, right in their tasks, no matter how sordid they may be. It would open their eyes, so that they might see something in their toil other than a monotonous grinding fight for existence. It would make them realize as they never have realized before that the work of the modern shop or factory is something actually noble; something to glory in.

Everyone knows the stigma that often attaches to labor and no one knows it better than the laborer himself. Yet here is the chance to change this stigma into an honor, to give labor a dignity and a meaning such as it has never had before.

Art can accomplish this through the compelling power of symbolism. Art today is by these means expressing some of the greatest truths of life and expressing them in a way that is stirring the world to its depths. The movement is fascinating, wonderful, full of the greatest promise for the future.

It has come to the social workers to apply this to the great problem of uplifting labor. How? By inculcating in the children of the laborers—the workers of the near future—through the medium of music and of the dance, of drama and of pantomime, a deep sense of the great poetry inherent in every phase of workaday life. This can be done. The child is most susceptible to such impressions provided they can be presented to him in a way he will appreciate. And so to this end, the Association of Neighborhood Workers is organizing a "labor pageant," to be held late next spring in Central Park, wherein the beauty of labor, both historical and actual, will be symbolized in the dance and pantomime in a way that will give it a charm and a purpose such as it has never yet had before.

To be done at all, it must be done well. This means special music and much special training, all of the best—and this costs money. A minimum estimate is $1,500. The association has agreed to hold the pageant provided this money is all promised before January 3.

Some of our greatest American dramatists, musicians and painters are most heartily co-operating in this idea, and some of the leaders of trades unions see in it a great force for good. All believe that it marks the beginning of one of the greatest movements of modern times, where labor and art may join, each helping the other to the uplift of both.

COMMUNICATIONS

CLAUSE 79

[The following communication to the editor on Clause 79 of the Page law make a total of twenty published in THE SURVEY in the past six months. Justice Bischoff's decision that the clause is unconstitutional, reported on another page of this issue, has rendered it inoperative in the Night Court for Women and will be held to act as a stay to further communications on the subject in THE SURVEY. The present grist is comprehensive, both in the way in which the different writers have marshalled their points and in the positions taken, representative as they are of the different angles of approach to the problem. With the pressure of other subjects upon our space we can in future accept for publication only letters which do more than repeat arguments which here or in previous issues have been adequately advanced or which are more than expressions of opinion in regard to those arguments. Distinctly new matter will, of course, be considered and THE SURVEY will continue to interpret the sanitary and social aspects of the venereal diseases and the developments with regard to them.—ED.]

TO THE EDITOR:

It is, I think, important that women throughout the country who are following with strong interest the discussion of Clause 79 of the Page law should express through the medium of such an open court as THE SURVEY their feeling in the issue involved. I happen to know the judgment upon the matter of a number of southern women—nurses, writers, professional and home-keeping women. All view the one-sided provisions of this clause with deep indignation.

From THE SURVEY's report (issue for November 19), of the recent meeting of the American Society of Sanitary and Moral Prophylaxis I quote as follows: "Not the least interesting part in the discussion was that taken by the women. Without a place on the program, although they formed three-quarters of the audience, with no chance to speak until a motion to adjourn was before the meeting, they nevertheless made an impression on all who were present . . . As discussion, it was emotional and incoherent, but it struck home to many as evidence of an absorbing moral fervor. Under it all lay a sex consciousness of deep wrongs suffered by women, a storm of protest that has been gathering for centuries and is wreaking itself pell mell on what they regard as a 'hypocritical and pharisaical law.'"

I sometimes wonder if men realize what thinking women are beginning to think of them—not of all men, but of many men. I wonder if they know how odious is growing the word "chivalry," of what cold mockery dwells in the words "the church." I wonder if they know what encampments sometimes seem the legislatures, and how murderous appears the silence of the physician. I wonder if they know how stained shows the cradle in which lies the future race, and how fearfully the motto above the cradle looks like "Degeneracy." Since the law declares that the father is next of kin to the child, the nature and nurture of the future race ought of course to be left to man. If the future race is blind or paretic, was it not his?—and he has had his animal pleasure. But since there is a remote person called the mother, with no place on the program truly, but yet with a chance to speak just before the meeting is adjourned, there may perhaps be heard a comment now and then as to that legend over the cradle and as to what it might be if the man so willed it. It might be "The Super Race."

MARY JOHNSTON.

Richmond, Va.

TO THE EDITOR:

In my paper on the sanitary supervision of prostitution as provided for in the Page bill, to which reference was made in THE SURVEY for November 19, I considered the practical workings of this bill from the sanitary point of view. Some of those who advocated this measure were outspoken in their denunciation of *reglementation*. The inconsistency of this attitude is shown by the fact that a distinction is thus made without an essential difference. The substantial identity of sanitary supervision as employed in France and other countries and that provided for in the Page bill will appear from the following:

Both comprise arrest, arraignment, conviction, registration, medical examination, hospital treatment, and discharge from the hospital.

	Reglementation.	*Page Bill.*
Arrest	By the morals police agent for prostitution.	By the police officer for solicitation on the street.
Arraignment	Before the inspector of the *Bureau des Moeurs.*	Before a magistrate of the inferior court.
Conviction	By the testimony of the morals police agent.	By the testimony of the police officer.
Registration	By inscription on the records of the *Bureau des Moeurs.* (Optional.)	By finger print impressions. (Compulsory).
Medical Examination	By the physician of the *Bureau des Moeurs.*	By the physician of the Health Department.
Commitment to Hospital	Upon verdict of the physician that she has been found diseased.	Upon verdict of the physician that she has been found diseased.
Detention in Hospital	Until cured.	Until cured.
Discharge from Hospital	By certificate of cure from attending physician.	By certificate of cure from attending physician.

In France the law forbids the inscription of minors. If a girl under eighteen years of age is arrested, she is not sent to the hospital, even if diseased. Her parents or guardians are communicated with, and if they do not receive her she is sent to a home or reformatory at public expense. The Page bill is more severe and drastic in its provisions. The girl, if convicted of prostitution and found diseased, is classed as a criminal, without reference to minority.

The French system provides an additional sanitary guarantee by the weekly medical examination of all inscribed prostitutes, in order to detect and eliminate as promptly as possible sources of contagion. If this examination shows the woman to be diseased, she is sent to the hospital; if she is free from disease, this fact is recorded on her card of inscription. This card bearing the certificate of the physician that the bearer has been examined on such a date and found free from disease, constitutes the so-called "license." This certificate permits her to frequent certain streets without police molestation, as a compensation for her submission to the weekly medical examination. Hence, all prostitutes are divided into two classes, the *soumises* and the *insoumises*, the latter, of course, including all clandestine prostitutes.

It will be seen that the sanitary supervision of prostitutes constitutes the essence of *reglementation*.

Perhaps the most intelligent and impartial study of *reglementation* ever made in this country was that made by the Committee of Fifteen whose report was embodied in The Social Evil, now out of print, but on file in many libraries. This states that "the chief distinguishing feature of modern regulation is its endeavor to stamp out the diseases that everywhere attend vice . . . so prominent has the sanitary aspect of the problem of vice become that the term regulation is used generally to denote sanitary regulation alone" (p. 24).

PRINCE A. MORROW, M. D.

New York.

TO THE EDITOR:

Maude E. Miner has explained in your columns some defects in the working of Clause 79 of the Page law. Will you allow me to repeat some reasons why many people think the whole clause objectionable, however excellent the intentions of its framers may have been?

1. It tends to increase vice. Its advocates question this, and advise us to wait and see. But it must work that way automatically, just as the consumption of tinned meats went up when the government undertook to inspect them and to condemn those that were dangerous.

2. It is inefficient. The effort to protect the health of dissolute men by imposing compulsory medical examination and treatment upon dissolute women has been thoroughly tried out in a score of European countries, and has proved a failure everywhere. It has failed although it has been carried out with a completeness and a degree of high-handed power given to the police which no American community would stand. Paris is the head center of the system. There it has been rigorously applied for more than a century. Not only the handful of women arrested for disorderly conduct, as in New York, but all the fallen women of the city, so far as they are known to the police, are subjected to medical examination at short intervals. Yet Paris is scourged to a notorious degree with the class of maladies against which this legislation is designed to guard, and the Municipal Council has again and again recommended its total abolition.

It fails for many reasons. One is that the police are never able to bring under examination more than a small fraction of the women engaged in this miserable business. What impression would it make upon an epidemic of yellow fever if one in a hundred of the women afflicted with it were put in quarantine, while the other ninety-nine women and all the men went unquarantined? It may be said that sequestering even a few of the women must do a little good. But it might easily do more harm than good, if it gave the public the idea that an effective quarantine was maintained, and hence people who would otherwise keep away ventured freely into the yellow fever district.

The late Dr. Elizabeth Blackwell worked with Mrs. Josephine E. Butler through the seventeen years' agitation which led to the repeal of this legislation in England. The late Dr. Emily Blackwell was for many years a member of the little Vigilance Committee in New York, made up largely of physicians, which warded off repeated attempts to introduce the system after the Civil War. All my life I have been accustomed to hear the medical futility of such legislation discussed, and to rejoice as one European country after another abandoned it. Forty years ago the majority of doctors in England and Europe believed in it. Of late years three great international congresses of physicians have been held to discuss the best means for preventing the spread of this class of ailments. At each of them it proved impossible to pass a resolution recommending the compulsory medical examination of women as a means to this end. The preponderance of opinion was that this had proved a gigantic sanitary failure. Even in those countries where the system still prevails, there is a strong and growing movement against it.

3. It is unjust, since it makes a wide discrimination between men and women guilty of the same offense. A writer in THE SURVEY has said that the law already makes such a discrimination all along the line. That is true in England. There a husband can divorce his wife for infidelity, but a wife cannot divorce her husband for the same cause.

A woman who annoys a man by solicitation on the street can be arrested and sent to jail, but a man who annoys respectable women by solicitation on the street cannot be punished. American women have boasted that here the law has been impartial. Men and women guilty of disorderly conduct were legally liable to the same penalty, although it has been largely the custom of the police to arrest the women and let the men go. When Colonel Roosevelt was at the head of the New York police, he ordered them to apply the law impartially, and it made quite a stir. He has repeatedly expressed his disapproval of regulation on the ground that "it is mean and detestable to strike at the woman and to let the man go free." Many women feel it to be a very serious wrong to embody a double standard of morals in the law.

Some upholders of Clause 79 insist that it is not "regulation," because the government does not furnish the women with health certificates. But the men who crowd the Night Court all see if a girl is given a clean bill of health by dismissal, and some of them often follow her out of the court. Mrs. Josephine Butler and her experienced co-workers have always regarded the compulsory medical examination of this class of women for the benefit of their customers as the crux of the whole regulation system, the fundamental injustice involved in it. This exists in the Page bill. It provides for shutting up the girl not until she is reformed, not until she has been punished enough, but simply until she is safe for her customers.

A correspondent of THE SURVEY recommends that instead of trying to get the clause repealed, we should try to get its compulsory medical features applied to men as well as to women. There is not the remotest chance of inducing the Legislature to do this. Many years ago a measure much like the Page bill was introduced in the California Legislature. A woman secured the introduction of a parody upon it, a bill just like it, except that its provisions were applied to men instead of to women. The second bill killed the first, and buried it under inextinguishable ridicule.

Clause 79 is radically and fundamentally objectionable, and all friends of right measures ought to urge vote against it. The whole problem of the social evil in a city like New York is terrible and perplexing. But, while it is very hard to see what should be done, there are some things which it is perfectly clear should not be done, and this is one of them. My own opinion is that the problem can be solved only by a systematic campaign of education, something like that which is being made against tuberculosis, and that the underlying causes must be attacked through improved economic conditions, a much larger provision of wholesome amusements for young people, abundant opportunities of free medical treatment for those suffering from the hygienic consequences of wrong-doing, and a sharp application of law to the traders in vice, those who exploit the unfortunate girls for their own profit. At present, in most states, the law provides a heavier penalty for stealing a horse than for stealing a girl.

ALICE STONE BLACKWELL.

Dorchester, Mass.

TO THE EDITOR:

Recollecting the discussion at the American Society of Sanitary and Moral Prophylaxis November 10, it may be of interest to refer to a similar discussion at the meeting of the German society of the same name held in 1903. Speaking to the question of the sanitary usefulness of placing diseased prostitutes in hospital, one of the members said: "A mathematical proposition that is a favorite with regulationists, and that is, when superficially examined, plausible enough to seem as an argument in favor of regulation, is this: One prostitute receives, on an average, four men a day. Now, if a diseased prostitute is interned for twenty days there have been eighty men preserved from infection. But this argument would only hold good if the eighty men were perfectly continent during the time when the prostitute in question was incarcerated. This, however, is by no means the case. If prostitute A is interned, the men seek prostitute B, and if she is interned then C, and so on. This, then is the reason why the most ideal regulation is useless and why the spread of venereal disease cannot be limited by removing a number of prostitutes from use. If one-third of all are interned, the other two-thirds will be more in demand. If another third are removed as diseased, the remaining third are not enough and new recruits are sought. That was the case in the Middle Ages when pious rulers like St. Louis drove all prostitutes out of their dominions. In a little while the number had reached its former height, and so it will remain as long as the lust of man is allowed to make demands" (page 366, Zeitschr. f. Bekämpf. d. Geschlechtskr. 1903).

As showing how much or how little there is in the claim that the removal of diseased prostitutes, by clearing the streets, reduces the demand the following figures were presented in the same discussion: "In 1899 the Prussian hospitals treated in all 13,071 cases of women with venereal disease. Of these, only 5,489 were prostitutes. The rest were servants (2,501), married women (1,047), children under fifteen years (358), and working girls in shops, factories and stores, etc., who made up the rest."

At this same congress Neisser touched on some of the same points that were discussed here in New York, the following quotations from his remarks being pertinent: "To estimate correctly the significance of prostitution as the source of venereal disease it is always to be borne in mind that the diseases of prostitutes are conveyed to them by infected men, and, very frequently, this has not first occurred after the girl became a professional prostitute, but before she had definitely entered upon that life (page 166). Careful ob-

servation showed that, at the end of a five-year period of record and observation, that is to say, in spite of regular surveillance, 66 per cent of prostitutes were syphilitic (page 174). Truly, it is doubtful whether such hygienic benefits as we may have attained by regulation outweigh all the reproaches which, with more or less justice are met with from the moral, social, political, legal, and other standpoints (page 196). Only such methods should be adopted as are free from any shadow of civic degradation (page 217). My experience in Breslau shows that the simple fact of the city hospital having a division for prostitutes drives many women patients away from it" (page 229).

LAVINIA L. DOCK, R. N.

New York.

TO THE EDITOR:

The first three items in Dr. Morrow's parallel columns may be put aside in the present discussion for as to them the Page bill introduced no changes. His fourth item seems to me misleading in that registration under a licensing system applies to *all* prostitutes, and under the Page bill the finger print system applies only to those who have been arrested and convicted in court. His fifth item is open to the same criticism in that medical examination under a licensing system applies to all prostitutes, and under the Page bill only to those who have been arrested and convicted. His sixth, seventh and eighth points are open to precisely the same criticism.

There seems to me then to be little left of Dr. Morrow's parallel columns. May I suggest a substitute?

	Licensing System	*Page Bill*
Prostitution	Recognized as lawful	Contrary to law
The offence	Being diseased	Prostitution
Medical examination	All prostitutes	Only those arrested and convicted
Disposition of those found healthy	Released	Committed to workhouse; fined (in a few cases), or placed on probation (in a few cases).
The average man	Knows that all prostitutes are supposed to have been medically examined	May have heard that of the small proportion arrested and convicted, those diseased have been committed to hospitals
The attitude of the community	Recognizes prostitution as lawful and tries to prevent disease.	Brands prostitution as unlawful but tries to diminish infection.

Another of your correspondents, writing from Dorchester, Mass., says: "But the men who crowd the Night Court all see if a girl is given a clean bill of health by dismissal, and some of them often follow them out of the court."

Truly a most serious objection if well founded. But where did the writer get her information? The women who, after conviction and after medical examination, are found to be free from disease, do not walk out of the court. They stand convicted and subject precisely to the same penalties as was the case before Clause 79 was enacted. Nearly all of them are committed to the workhouse. A small number are placed on probation, and a small number are fined. The actual figures as to the disposition of the total number of women convicted during the period in which Clause 79 was in operation, are as follows:

Sent to the workhouse on an indeterminate sentence	120
Sent to the workhouse for a definite period	51
Sent to other institutions	2
Sent to a hospital or to the workhouse hospital	80*
Fined	17
Placed on probation	14
Total	284

*Most of these went to the workhouse; but fifteen cases went to the City Hospital on Blackwell's Island.

HOMER FOLKS.

LAW STUDENTS' IDEA OF CHARITY

TO THE EDITOR:

In the practical program of the social worker one of the most important items is the education of the public in matters philanthropic. The answer which the public gives to the question, What is a charity? is of obvious moment to those who are endeavoring to interest the public in the alleviation of social conditions.

An inquiry which I was recently enabled to make in the largest of our western state universities seems to me to throw at least a little light on the attitude which the average university law student entertains toward charities. The investigation embraced 213 senior law students—enough to render the results interesting, if not completely representative. The task was assigned to these students of drawing up a fictitious will. Among the various provisions to be incorporated therein was one providing for the bequest of a sum of money "in trust for a charity." No restriction was placed upon the sort of charity to be favored. Since the chief interest of each student was to draft a will valid in its legal form and phraseology, it is not improper to assume that by far the great majority of them bequeathed their fictitious clients' money to the first charity which came into their minds. Fantastic endowments originated for the occasion might appear, but they would be comparatively few in number and easily detected.

Proceeding on these assumptions I examined the 213 wills drawn up, with a view to ascertaining what sort of thing presented itself

to the minds of these students of the law when the word charity was spoken to them. The results may be partly psychological in interest, but they cannot help but reveal to some extent the state of thought which these young men had reached concerning worthy charities. If a majority of them had turned over money to the use of a committee on standards of living and labor, quite a different state of mind would have been revealed than if the same majority had joined in fostering county almshouses.

My tabulation shows that 176 of these 213 students, or 82 per cent, bestowed their clients' money upon institutions of one sort or another, leaving 37 who favored charities not institutional. The 176 institutions favored grouped themselves as follows:

Hospitals	58[1]
Schools and colleges	44
Orphanages	24
Churches and Y. M. C. A.'s	18
Public Libraries	6
Florence Crittenton Homes	1
Scattering (including homes for feeble-minded, blind, aged, old ladies, poor, homes for boys, etc.)	25
Total	176

Perhaps the institution most conspicuous because of its absence from this list is the social settlement, which found no benefactor among the students.

The thirty-seven non-institutional charities grouped themselves as follows:

Public playgrounds	5
Associated charities	4
Anti-tuberculosis agencies	4
Masonic lodge	4
County poor outside institutions	3
Pasteur treatment of hydrophobia	2
Public parks	2
International peace	1
Widows of Cherry Mine victims	1
Child placing out agencies	1
Cause of prohibition	1
Others (including fantastical)	9
	37

If some of these seem to partake little of the nature of a charity, in the accepted usage of that word, the fact does not reveal any more enlightened views on the part of these students as to what it today regarded as the most needed philanthropic work. Only one of the 213 directed his client's money to the aid of widows, a class of persons who gave rise to one of the chief problems before the National Conference of Charities and Correction at St. Louis last May.

W. D. Lane.

Union Settlement, New York.

[1] Two of these were tuberculosis hospitals.

FATHER RYAN'S ARTICLE

To the Editor:

I meant to have written you commending the very remarkable article by the Rev. John A. Ryan in The Survey of September 3. I am not a believer in the minimum wage, but that is a statement in favor of it which is so fair-minded and shows such a candid appreciation of the opposing arguments as to make converts if anything can, and incidentally to do the more important service of raising the whole plane of the discussion.

Joseph Lee.

Boston.

A SETTLEMENT FOLLOW-UP

To the Editor:

The problem of a shifting population is so comprehensive in scope that a thorough discussion would touch nearly every aspect of the settlement problem. The writer wishes to call attention to a few salient points.

From the settlement point of view, the problem of a shifting population can be more clearly formulated as that of a graduating population. In every city the national groups in settlement neighborhoods shift. Irish are superseded by Jews, Jews by Italians or Negroes, Italians by Slavs, and so on. The movement of a group denotes, in most cases, that it has moved ahead one step, however slight, of the economic and social status of the neighborhood. It is, in the main, not a neighborhood but a city settlement problem. We realize this when we must face the problem of settlement graduates. It seems discouraging at times, when after years of contact with promising young men and women, they leave the neighborhood. It is a sieve-like process. A few keep in touch with the old neighborhood house, but in the main there is a waste of promising social energy. The old neighborhood loses the leaven. This would not be at all regrettable did a new neighborhood gain it. The situation is serious when we realize that the graduating population frequently emerges from a neighborhood with the advantages of settlements and other social agencies into a neglected neighborhood lacking these influences for moral and social progress. It frequently happens that the young men and women in these neighborhoods show the ugly traits of quasi parvenus. They take the conventional pleasures of the new neighborhood and lose the spur to ambition of the one from which they emerged. "I wish there were a settlement house here," said a father to the head worker of a Boston settlement. "My children are so frivolous now." He was a new inhabitant of a new and neglected neighborhood.

How can we meet this problem? Only by inter-neighborhood co-operation. Neighborhood problems are organically inter-related. They challenge us to take a larger city point of view. They must be met by an inter-

neighborhood organization. A real estate operator in New York predicted that a new tenement district would arise in the vicinity of a new loft district. He is purchasing boarding house property and preparing to erect the tenements for the factory workers. He foresaw the drift of population and is preparing to reap a profit. He exercised foresight in the interest of profit. We, as social workers, must prepare for the shifts in neighborhoods by exercising social foresight in the interest of the well being of the new neighborhood. It is incumbent upon us to survey the field and be on the alert to send out outposts. The city should be dotted with a network of centers of neighborliness. For this purpose, inter-neighborhood organizations must cooperate through some form of record system by which a child who leaves a neighborhood house is not lost. If a rigid transfer system like that in the public schools is impossible, there should be some method of referring children who leave a settlement to agencies with similar purposes in the new neighborhood. A more practicable arrangement would be to establish branch settlements in various sections of the city to which members may be transferred. This is only possible if a settlement is willing to discentralize its activities.

Above all there must be a constant survey of the drift of population and a plan devised for placing outposts or new settlements in the new neighborhoods. I use the word outpost advisedly, for in most cases it is essential that neighborhood activity begin on a small scale. Through an efficient secretary at large, a neighborhood workers' association can institute such a campaign of propaganda and plant these outposts themselves, dotting the city with centers of neighborliness.

HENRY MOSKOWITZ.

Down Town Ethical Society, New York.

HELP THE OLD PEOPLE TO HAVE A HAPPY CHRISTMAS

There is to be an attractive sale of articles, suitable for Christmas gifts, made by the aged and infirm inmates in the City Almshouses in Room 610 of the United Charities Building, on December 14th, from 10 until 6. Some of the work done by this unfortunate class of people, many of whom are hopelessly crippled or blind, is most artistic. Among the articles which will be for sale at reasonable prices are scrap baskets, work baskets, bath room rugs, rag rugs, hammered brass work hobby horses, toy animals, small carved articles, veranda tables, foot stools, individual hat stands, toboggan caps maids' and butlers' aprons, etc.

This sale is arranged yearly by the New York City Visiting Committee of the State Charities Aid Association. No commission is charged on the sale of these articles and the money will be sent directly to the old people in time for Christmas.

Is Mankind Advancing?

A Thought-compelling Book

By MRS. JOHN MARTIN

8vo, 302 Pages, Cloth, $2.00 Net

A vigorous discussion of this inexhaustible question, marked by courage, a keen scepticism, and wide acquaintance with literature and life. The results arrived at will often prove surprising and at all times stimulating to thought and inquiry. A book for bold and open-minded thinkers.

THE COMMON WELFARE

PHILADELPHIA'S GLAD TIDINGS

Public sentiment in Philadelphia has just scored a triumph in early shopping, and Christmas this year will have real meaning for about 35,000 more employes than ever before, through an agreement among the larger merchants to close at 6 o'clock through the holiday shopping season. The story of this victory in Philadelphia is so distinctly a tribute to the power of public opinion, and its achievement has already brought so many questions from merchants and civic bodies of other communities as to how it came about, that it is given briefly here.

In December, 1905, six years ago, every large store in Philadelphia, with one exception, kept its doors open evenings for two weeks or more preceding Christmas. Representatives of the Consumers' League, making nightly inspection, reported that twenty-six establishments in one small district were violating the law which limited the hours of women at that season to ten in one day. The usual schedule for the saleswomen was from 8 A. M. to 10 P. M., in some stores on alternate days; in others, continuously.

In the next two years, systematic notification and visiting of the merchants, and widespread appeals to all organizations of women in and near Philadelphia, to several hundred ministers, and to the general public by means of the newspapers, had begun the change. The inspectors of the Factory Department were kept at their posts during the holiday shopping season instead of having a vacation, and the stores so arranged their schedules that all employes who remained until late at night came in proportionately late on that same day—thus not exceeding ten hours of work. Thus, in 1907, only five establishments were found to be violating the law in place of the twenty-six reported two years before.

During this time a slow but steady reduction of open nights took place in smaller as well as larger stores, and by 1908 ten nights represented the maximum. Last year, however, the first decisive step was taken to close the stores. The Consumers' League, desiring to test to the utmost the power of direct public pressure, suggested to about 5,000 women that they write personal letters to the stores expressing their opinion of night shopping. The character of the response appears in the fact that certain firms found it necessary to issue printed replies to the letters, while others detailed two or three clerks for a number of days to reply to them. Simultaneously the newspapers gladly responded to a request for editorial comment and support of early shopping hours.

The merchants' answer to the public was the announcement that open nights were cut from ten to five, one store establishing 6.30 as a closing hour for the first time.

The approach of the present season brought a new situation. A recent law prohibiting the employment of girls under eighteen and boys under sixteen after 9 P. M. is, for the first time, subject to the test of the holiday trade. A notice calling attention to this provision and asking for information as to plans for the holiday season was sent to all large merchants by the Consumers' League in November.

The answer came late the evening of December 1 over the telephone. The head of one of the largest retail firms called up the Consumers' League to say that he had good news. "I thought that you should certainly be the first to hear it," he said. "While I am speaking for ourselves only, I can add that none of the department stores will remain open after six during the entire season. I congratulate you and the women you represent on what you have enabled us to do."

Anticipating criticism and protest from large numbers of habitual night shoppers, and congestion on coming Saturdays, as a result of this change, the Consumers' League has taken a further step. It is issuing a request to other employers

in Philadelphia to allow groups of their workers to take a mid-week half-holiday, if they desire it, in order to do their shopping. The newspapers—which have been the greatest factor in accomplishing all that has been done—are taking up this matter and issuing the request as an open letter from the league. The plea is that factories and business offices cooperate with merchants in making this most popular gift to the working people of Philadelphia. It is in line with action taken by some offices in New York and elsewhere for a number of years and notably by the Visiting Nurse Association of Chicago for the past six years. Half of the nurses have a half-holiday on Wednesday and half on Saturday the year round, but during the second week of December an additional half day is added to give an entire day for shopping. Of the full staff of sixty-six, half are thus off duty on Wednesday and half on Thursday. One thing only is compulsory—that they take the full day for their own shopping.

CHICAGO STRIKE STILL UNSETTLED

With the exception of the firm of Hart, Schaffner and Marx, the clothing manufacturers of Chicago have reiterated that they "have nothing to arbitrate" and will accept only "unconditional surrender" from their striking workers. This is in the face of an urgent statement by Mayor Busse that the whole community desires the end of the struggle and that "neither side should object to submit its case to a fair arbitration court"; and an equally vigorous declaration by Alderman Merriam that "those who decline to accept it [arbitration] assume a grave responsibility to the community," and that "if industrial war continues the public should know exactly where this responsibility lies." Public sentiment in Chicago almost universally supports this point of view.

Every newspaper in Chicago has condemned the attitude of the employers and, as one editor puts it, "hunger and cold as potent peace makers alienate the sympathy of the great majority of reasonable and humane citizens."

On all sides the basis of arbitration upon which Hart, Schaffner and Marx have agreed, and upon which their 10,000 employes are voting, is recognized as the fairest and most reasonable way out of the difficulty. Among the employes of this firm, the cutters' union on December 5 voted almost unanimously to accept the plan. Further meetings were postponed, however, so that the terms of the agreement, accompanied by an explanation by the strike leaders, might be printed in various languages and a large number of small meetings could be arranged. In these small meetings certain forces which have been at work to dissuade the strikers from accepting the plan will not be able to use the tactics which they might use in larger gatherings. These promptings come from certain employers, who are convinced that if the strikers refuse the agreement they will soon be reduced to accept any terms which may be offered them, thus eliminating all possibility of collective bargaining; and from certain labor leaders, who fear that they will lose power if the settlement comes about through the strike leaders who participated in the mayor's conference, and to whom most of the credit must be given for the reasonable attitude which has characterized the conduct of the strikers.

The strike leaders have sent out appeals calling upon the community to supply means for the strikers to win against hunger and cold, if a settlement is delayed. Mrs. Raymond Robbins, president of the Women's Trade Union League, is treasurer of the fund. She states that every dollar received will be accounted for publicly and will buy a dollar's worth of provisions at wholesale rates. "We need the help of all the people," she declares, "to save women and girls from a hunger bargain—a bargain which means the surrender of civilization."

The commissary stations are helping the strikers who are in the most straitened circumstances. Some idea of the amount of food handled may be gained from the fact that over 9,000 loaves of bread alone are used each day. In fact, one of the important results of the Chi-

cago strike may be said to be the appreciation by labor leaders that strike relief thus administered, involving purchase and handling of food by wholesale, can be made to last longer and to play an important part in keeping the ranks of the strikers solid.

The largest demonstration of the strike took place last week, when a parade of about 20,000 marched through some of the streets of the west side and ended in a great mass meeting at the Chicago National League Baseball Club, which gave the use of the grounds and supplied sandwiches and coffee to the women and girls. With a large portion of the stands and bleachers filled and a big crowd standing in the field, a dozen speakers, some facing one way and some another, some speaking one language and some another, urged the strikers to stand firm until they should win.

THE HOUSE OF GOVERNORS FOR HUMAN CONSERVATION

Conservation of resources, both human and natural, and direct primaries, were the two chief subjects considered by the "House of the Governors" which drew an attendance of twenty-four governors of states to its sessions at Louisville and Frankfort, Ky. Excepting Governors Noel of Mississippi and Deneen of Illinois, the majority believed that the saving of natural resources should be left to the states. The discussion of natural resources was so prolonged that it all but crowded out that of human resources; but perhaps the most important action of the whole conference, which fell under the latter subject, was the adoption of a resolution introduced by Governor Hadley of Missouri, providing that each governor should make a report on the liability and compensation laws of his state. All agreed that the present laws are unsatisfactory. Governor Hadley in his address showed the great number of lives sacrificed on railroads and in mines and the thousands who are injured. Liability insurance costs employers $95,000,000 for the protection secured. The insurance companies pay out for claims only $40,000,000, of which lawyers receive thirty per cent. In but fifteen per cent of those cases where people are injured in industry, does a right to recovery exist. Governor Hadley criticized the doctrine of negligence that prevails in most states, and commended the theory of comparative negligence and a system of optional insurance to which both employer and employe contribute. He hoped the investigations now being made in a number of states would lead to the drafting of a bill applicable in a general way to all states.

The direct primary system was criticized because it allows non-members to vote for the selection of candidates and for the policies of a party, and because it is expensive and tends to destroy party authority. It was admitted that the method had come to stay, and on the whole the plea of Governor Fort of New Jersey in behalf of the plan found approval.

The problem of penal reform, including the vexed question of prison labor, was favorably referred to a committee which will have charge of the program for the next conference.

GROWN ACTRESS AS THE BACHELOR'S BABY

Francis Wilson's successful presentation in Boston of his play, The Bachelor's Baby, with a girl of twenty-three in the part taken in New York by a young child has been watched by New England members of child labor committees with the keenest interest. Last spring Boston theater managers secured thousands of signatures to a petition protesting against the court decision that the Massachusetts child labor law applies to the stage. This bars children under fourteen. The question was discussed at legislative hearings and in a number of communications to THE SURVEY.[1]

The managers' petition stated that "Massachusetts laws prevent the public from seeing such plays as The Bachelor's Baby, Macbeth, The Squaw Man and others." All three of those mentioned have been successfully presented in Boston without child actors, and A Matter of Money with a girl of twenty in a

[1] See THE SURVEY for May 21, June 18, July 23, August 13 and December 3, 1910.

twelve-year-old part, Mary Jane's Pa with a girl of fourteen in an eight-year-old part, My Man with one of eighteen in a six-year-old part and similar substitutions of older persons in The Awakening of Helena Ritchie, On the Eve, The Traveling Salesman, Havana, School Days and A Fool There Was, and groups of child parts in Old Dutch, Joe Welch and Company and the Gus Edwards Company.

Many people in Boston point to these productions as proof of President Emeritus Eliot's contention, that "in general the theatrical profession is perfectly able to use children over fourteen years of age to fill all the parts that ought to be represented on the stage." Francis Wilson contended that this is not true and has kept open the question not only of fact, but of Dr. Eliot's motives, in a succession of newspaper articles and letters. His point was that while a more mature actor might give a pleasing and artistic representation of a child part, the audience would see the difference and lose the sense of illusion which is necessary to dramatic success.

The part of the little girl in The Bachelor' Baby was taken by Ethel Downie, a girl of twenty-three, who has appeared in children's parts in The Awakening of Helena Ritchie and in Old Dutch. The Boston *Post* said of her: "Miss Ethel Downie was the baby and a very cute child she was, giving a realistic portrayal of a five-year-old full of 'kid questions' and strange antics. . . . The value of the piece will not be marred in the least." A correspondent of THE SURVEY writes: "I attended the first performance last night and found it very amusing. The child was applauded when she appeared the first time and when she left the stage. She was very attractive and did not appear to be over eight years old. Mr. Wilson no doubt found technical difficulties in using a woman for the part, but he has repeatedly stated that the best and only adequate test of a part is its reception by the audience. So tested, he has made a success of it in Boston, and found a way to retain children's parts without subjecting children under fourteen to a regular stage life."

PHYSICIANS ORGANIZE FOR MEDICAL SOCIOLOGY

Recognizing the intimate relationship between disease and the social-economic system of today, a number of public-spirited physicians of New York, headed by the venerable Dr. Jacobi as honorary president, have lately organized the American Society of Medical Sociology, which it is hoped will help solve the difficulties long felt by conscientious physicians in dealing with those forms of disease in which the cure lies in improving conditions.

This society plans to include in its membership social workers as well as physicians and to make an unbiased study of all problems of a medico-sociological character, presenting the results frankly and fearlessly regardless of either prejudice or special interests. The questions at present under investigation are:

The need of a federal department of health.
Tuberculosis as an economic disease.
The relation of the increase of insanity to the strain of modern life.
The reported increase of cancer and its causes.
The most humane and effective methods of dealing with prostitution.
The best methods of preventing venereal infection.
Sex hygiene in all its phases.
Abortion in its medical and ethical aspects.
Alcohol (a) as a beverage, (b) as a medicine; physiologic, medicinal, social and economic effects.
Infant mortality; principal causes and prevention.
Occupational diseases.
Food adulterations and their influence on health.
The causes of quackery, Christian Science and other cults, and the influence of the irregular cults of medicine on public health.

Dr. William L. Holt, second vice-president of the society, is at present investigating the treatment of these and like problems in Europe. The results of the investigations will be disseminated by means of meetings, lectures, reports and pamphlets. The society hopes in time to follow up its educational work by legislative activities. The officers are: Dr. A. Jacobi, honorary president; Dr. William J. Robinson, president; Dr. James P. Warbasse and Dr. William L.

Holt, vice-presidents; Dr. A. C. Jacobson, secretary, 12 Mt. Morris Park West, New York.

JOINT MEETINGS OF LEARNED SOCIETIES

Six of those nine societies which met in New York city last December will meet together again this year at St. Louis, December 27-30. Of these the American Statistical Society, and the American Political Science Association have not yet announced their programs. The program of the American Economic Association should be of vital interest at the present time, covering as it does the discussion of the economic aspect of immigration, the problem of poverty, money and prices, railway rates and the taxation of unearned increment, by such experts as Professors J. Lawrence Laughlin, T. S. Adams, Emery R. Johnson, Alvin S. Johnson and T. N. Carver.

On December 28 a joint session of the American Sociological Society, the American Statistical Association and the American Association for Labor Legislation will be held, at which the three presidential addresses will be read, that of Prof. Franklin H. Giddings of the Sociological Society on the Relation of Social Theory to Public Policy, that of Frederick L. Hoffman of the Statistical Association on Fifty Years of Life Insurance Progress and that of Prof. Henry W. Farnam on Practical Methods in Labor Legislation. Practically all the sessions of the American Association for Labor Legislation will be devoted to industrial accidents and industrial diseases, and great emphasis will be placed upon factory inspection and enforcement of the labor law. Among the papers will be Industrial Diseases in America, Frederick L. Hoffman; and Lead Poisoning in Illinois, Alice Hamilton, medical investigator, Illinois Commission on Occupational Diseases. Fred. C. Schwedtman, chairman of the committee on industrial indemnity insurance of the National Association of Manufacturers, will discuss Voluntary Indemnity for Injured Workmen, and D. L. Cease, Compulsory Compensation for Injured Workmen.

The program of the Home Economics Association will cover the discussion of dietetics led by Edna May of the University of Kansas; sessions on household management over which Adelaide Shelton of Teachers' College will preside, and on housing and sanitation led by Isabel Bevier of the University of Illinois. Among the subjects to be considered at other sessions will be extension work and the care of infants and small children.

LAWYERS ORGANIZE LEGAL AID SOCIETY

At the annual meeting the St. Louis Bar Association amended its constitution and by-laws so as to make possible the organization and maintenance of a Legal Aid Bureau. This is the first known instance of a bar association making such a provision. The bureau will be conducted by a committee of twenty-one members and will be organized after the plan of the Legal Aid Society of New York. An attorney will be employed to devote his entire time to the work, aided by as many assistants, paid and volunteer, as may be necessary.

Members of the St. Louis bar are enthusiastic and welcome this new means of service. There has been no legal aid society on the plan of other large cities, though the need for one has been fully as great, and attempts made to fill the need by small bureaus conducted by the Provident Association, United Jewish Charities, Self-Culture Hall Association and various institutional churches, have been wholly inadequate. They will be supplanted by the new organization which will have adequate means and facilities for serving all the people.

CHICAGO CHARITIES IN $200,000 CAMPAIGN

A popular and city-wide campaign to secure $200,000 for the United Charities of Chicago has recently been launched. A committee of many influential citizens, pulling together in effective "team work," with vigorous support by the newspapers, is rallying the whole community.

The campaign should prove most valuable educationally. The last few years have seen a wonderful broadening of the work of the organization which ought to be appreciated more fully by the people of Chicago. With administration unified and centralized, with increased efficiency and co-operation through all the district offices, and with far-reaching lines of preventive social work, the organization is grappling more vigorously than ever not only with the problems of relief, but with the conditions which make relief necessary. The infant welfare campaigns which have been carried on during recent summers have shown that back of the sick babies are uncared

Bradley in Chicago *Daily News.*

CERTAINLY!

for mothers, who ought to be relieved of the struggle to earn the family's livelihood and to whom a chance and training should be given to devote attention and better care to their children. Chicago's tuberculosis clinics increasingly demonstrate that a charity organization must not only help bury the dead, but provide funds to help save those for whom there is a chance, and focus effort on the elimination of conditions in individual families and throughout the city which help spread tuberculosis. In many other ways the United Charities has laid hold of the fundamental problems of poverty in Chicago, bringing to bear the most modern and intelligent methods. The people of the city, by the response which they are already making to the financial campaign, are showing that they appreciate this broad spirit and work. One significant gift, by Mrs. Emmons Blaine, provides money for several years to study, tabulate and present effectively facts which come to light in the work of the United Charities.

The fund reached $100,000 on December 2. The progress of the efforts to secure the whole amount are watched each day with great interest. On one of the prominent downtown street corners a large thermometer which registers up to $200,000 shows the progress of the "mercury" column toward the goal. Another thermometer is to be seen on the front of the United Charities building.

CONFERENCE ON CRIMINAL LAW

Many men actively engaged in the administration of criminal law were brought together by the annual meeting of the Wisconsin branch of the American Institute of Criminal Law and Criminology. Two justices of the supreme court and eight circuit judges were present, besides a large number of judges of inferior courts and prosecuting attorneys from many counties.

The conference heard and considered the reports of a number of committees of investigation which have been at work for the past year. In many cases affirmative action was taken in recommending legislation which the legislative committee was instructed to present to the Legislature for enactment. Among these was an amendment to the constitution to strike out the clause which forbids compelling a person to testify against himself in criminal cases. It was not the sense of the conference that one should be compelled in all criminal cases to testify against himself; but it was thought that the Legislature should bear the responsibility of safeguarding the privilege against self-incrimination where desirable, and of removing it in the newer,

but fast increasing, classes of corporate and fiduciary crimes, in which the evidence of guilt is almost always in the books and papers of the accused or in the breasts of the officers of accused corporations. Since it will require four years to amend the Wisconsin constitution, it was recommended that the present statutes be amended so as to permit the failure of the defendant in a criminal case to testify in his own behalf, to be considered by the jury in connection with the other evidence in the case.

Other recommendations were that the only expert opinion evidence on the question of insanity, where insanity is pleaded as a defense in a criminal action, be given by witnesses chosen from a commission appointed by the state; and that the age of girls coming under the jurisdiction of juvenile courts be raised from sixteen to eighteen and of boys from sixteen to seventeen.

The following matters were referred to the committees for consideration during the coming year: organization and unification of courts: trial of the issue of mental responsibility; sterilization of criminals and defectives; and classification and segregation of juvenile offenders.

BEVERLEY WARNER: FOREMOST CITIZEN

The Rev. Beverley E. Warner, who died November 27 in New Orleans, became a national figure in 1905 through the work he did during the yellow fever epidemic. The outbreak came just as he was planning a hard-earned vacation, which he instantly abandoned to enlist with citizens to assist the health authorities. When a central committee of volunteers was organized with branches in each ward, he was chosen chief and worked almost without rest in the great campaign of education to make the public realize and guard against mosquitoes. The theory of mosquito transmission was comparatively new then. The public had to be aroused and in large part persuaded against open disbelief in the efficacy of fumigating houses, screening cisterns, and oiling gutters. Mass meetings were held nightly in all parts of the city, many

1855—BEVERLEY E. WARNER—1910.

Dr. Warner, who founded Kingsley House, New Orleans, was for seventeen years the rector of Trinity Church.

of which Dr. Warner addressed. There were daily conferences of the volunteer boards, and all the while a vast amount of routine office work which required his supervision. Clashes of authority were not infrequent, complaints of a thousand and one things, done or left undone, were poured into his ears. Many times discouraged subordinates brought their troubles to him.

Through it all Dr. Warner never faltered or complained. He arbitrated disputes, listened to complaints, and either corrected the error complained of or, finding the complaint groundless, pacified its bringer and sent him away an enthusiast in the volunteer cause. Never for a moment was the work to which the the volunteers were pledged permitted to flag. Inspection followed inspection, and the danger places were eliminated one by one as they were reported. At the mass meetings and through the newspapers Dr. Warner sent his appeals to the people. Not only his fellow officers and subordinates were fired by something of

his own indomitable spirit, but the entire community was influenced by his enthusiasm, cheerfulness and perseverance.

Dr. Warner was rector of Trinity Church for seventeen years. During all that time he was an eager worker in many fields of social and educational effort. He organized Kingsley House, the first social settlement in New Orleans, and the Round Table Club, patterned after the Century Club of New York. He was a director of the Poll Tax Association, a member of the board of administration of the Tulane Educational Fund, and at the time of his death chairman of the committee which had in hand the erection of the new Newcomb College in which he was particularly interested.

His interest in Kingsley House was constant and inspiring. Eleanor McMain, the headworker, pointed out after his death the strength of his conviction that a settlement should be totally unsectarian. To this end he gathered about him a board of directors which included almost equal numbers of Protestants, Catholics and Jews. He joined in the neighborhood gatherings and was a prime mover for each new settlement activity as it was added—vacation school, recreation center, playground, children's garden and summer camp. It was characteristic that one of the first callers at the rectory after his death was a Jewish rabbi, who told a reporter that New Orleans had lost her foremost citizen and he had lost his best friend. His death came quietly while a service of prayer for his recovery was going on in the church next door. The windows of his room had been thrown open so that he might catch strains of the music.

Dr. Warner was born in Jersey City in 1855 and educated at Princeton and Berkeley Divinity School. He had honorary degrees from the University of the South and from Tulane. Following a brief rectorate at Bridgeport, Conn., he went to New Orleans in 1893 and was rector of Trinity until his death, except for a few weeks in a Philadelphia parish in 1005. He was well known through the South as a lecturer and was the author of Troubled Waters, a novel published in 1885; English History in Shakespeare's Plays, 1894; The Facts of the Faith, 1897; The Young Man in Modern Life, 1902, and Introductions to Shakespeare.

MIXING OIL WITH WATER

In this week's issue of THE SURVEY, we publish a review by Samuel Hopkins Adams of the present public health situation in Pittsburgh. Mr. Adams prepared this material for the fifth volume of the Pittsburgh Survey. It is a postscript to the review of the situation which he made in 1908, as handled in our magazine publication. Mr. Adams speaks from an expert knowledge of public health work in many of the leading cities of the country.

The creation of a municipal department (as against a health bureau), the putting through of plans for municipal milk stations, and medical inspection of schools, have been advances in the last two years which called for a supplementary statement in publishing the report in volume form. They are advances of a sort which would naturally predispose anyone to the new health administration. We have found them, however, accompanied by other developments of a sort, which any man who has known sickness in his own life or has seen a child die would condemn. The city health administration in Pittsburgh is watching other irons in the fire more closely than it is guarding the health of the people which is its trust. It is "attempting to combine practical politics and public hygiene, trying to mix oil with water."

The recent Pittsburgh Health Conference, which has aroused a progressive interest in health matters among the citizens of Pittsburgh, makes it not only opportune, but fairly an obligation on us, to bring out this report in magazine form at this juncture, in order to direct some of that interest to a quarter where death is the issue, and where public officials are trifling with it.

THE PRESIDENT'S MESSAGE

SAMUEL McCUNE LINDSAY
Professor of social legislation, Columbia University

In the language of social workers, President Taft has presented his annual report. The annual message sent to Congress last week is more akin to an annual report than usual, because it deals chiefly with things attempted and achieved and less with the future than the past. It asks for little new legislation and puts forth no considerable program. Its dominant note is the need for greater economy and efficiency within the present limits of governmental activity, but fortunately not without a perception of larger and more positive ends in view than the mere saving of taxpayers' money and the lengthening of the purchasing power of a government-spent dollar. The president says:

> In handling government expenditure the aim is not profit—the aim is the maximum of public service at the minimum of cost. We wish to reduce the expenditures of the government, and we wish to save money to enable the government to go into some of the beneficial projects which we are debarred from taking up now because we ought not to increase our expenditures.

A later message is promised, in which this idea is to be elaborated and a constructive social program outlined. Social workers will await the second message with great anticipation. Nothing could be expected of Congress at this short session and with the impending changes in party power, by way of execution of a social program. The president does well to reserve for a special message at a later date the presentation of his positive program, which will be a state paper of enduring importance if it points the way for the government to go into some of the beneficial projects to which it has hitherto turned a deaf ear, partly on account of the expense involved, but perhaps more largely because of the opposition of selfish and privileged interests and a too narrow view of the duties and constitutional powers of the federal government.

The president is peculiarly fitted to take and defend advanced ground on the duties and powers of the government in dealing with public health, industrial relations, conservation, education, and all the other main divisions of a social program, in which the national government has not done its full part nor set the example it ought to furnish to every coordinate or subordinate division of governmental authority, each acting within its constitutional prerogatives. When his program of economy and efficiency produces results that remove the excuse—too often a hypocritical cloak for a lack of desire—that the nation cannot afford to do its duty in these matters of social welfare, we shall be ready for a message that will mark the beginning of a new era.

The present message is an excellent business document, longer than any of its predecessors, but replete with clear summaries of public business in which the people are interested and about which the message, together with the departmental reports of cabinet officers, furnishes ample basis for a satisfactory understanding. Arbitration in foreign political disputes and in domestic industrial disputes has been tested as never before in a single year and has proven itself successful. Postal savings banks have been authorized and planned for and will be in partial operation on January 1. Parcels post on rural deliveries and steps which promise in the near future penny postage for letters are advocated, but involve asking magazines to give up what the administration regards as special privileges.

Recommendations that renew those of former messages favor, in perhaps too perfunctory a manner to secure results, plans for a bureau of health, for the better distribution of immigration and stricter provisions and enforcement of laws holding steamship companies responsible for the maintenance of our immigration standards, and for the improvement of the city of Washington. On the latter topic more radical steps are proposed than heretofore, looking to the acquisition of more land from the state of Virginia for parks for Washington, and a more economical and efficient school sys-

Morgan in Philadelphia *Inquirer.*
WITH THE COMPLIMENTS OF THE SEASON.

tem under the centralized control of the district commissioners, by abolishing the separate board of education. Ship subsidies, especially for the development of a merchant marine and for the promotion of better relations with South American countries, are advocated. A simpler, cheaper and more expeditious system of judicial procedure is urged and Congress asked to empower the Supreme Court to bring this about.

The frightful loss of life in the forest service during the year is properly the text for a recommendation for a much more costly, but necessary, plan for forest protection, through "the development of roads and trails in the forests, the establishment of lookout stations, and telephone connection between them and places where assistance can be secured."

The reform of the injunction process without its abolition in connection with labor disputes is urged along the lines of the president's well known views, which have been generally accepted and should be tried without further delay by Congress.

Significant among the few industrial topics which were not reserved for the promised second message are the recommendations: (1) that a heavy federal tax be imposed on the manufacture of phosphorus matches in order to stamp out a very serious abuse, in the opinion of the president, who was much impressed with the results of investigations inaugurated by the American Association for Labor Legislation; (2) that the provisions of the present eight-hour law in government service be extended to meet recent court decisions, so that it will cover its application to work done for the government under contract in the building of battleships and other vessels in private shipyards, and to heavy guns and armor plate contracted for and made at private establishments. Such extension of the present law would cover the abuses of the long day, such as were found recently not only at Bethlehem steel works while engaged on government contracts, but also generally throughout the industry; (3) that the widespread interest in the possibility of substituting the principle of compensation for industrial accidents for our unsatisfactory system of employers' liability, justifies our government in inviting the International Congress on Industrial Insurance to meet in Washington in 1913; (4) a contributory system for civil service retirement, with withdrawal features, as a means of maintaining a high standard of efficiency in the government service, without doing injustice or working hardship to the superannuated.

The president submitted with his message, as an appendix, the full text of his St. Paul address (September 5, 1910) to the National Conservation Congress, with its full and valuable statistics corrected to November 15.

A SOCIAL WORKER PROMOTED

HOMER FOLKS

John A. Kingsbury, for the past three years an assistant secretary of the New York State Charities Aid Association and in charge of its work for the prevention of tuberculosis, has accepted the position of general agent of the New York Association for Improving the Condition of the Poor, and will take office on January 1.

The New York Association for Improving the Condition of the Poor is one

of the oldest and strongest general relief societies in the country. Established in 1843, it has from the first combined direct and material relief to families with constructive social work. It became actively interested in the improvement of housing conditions from 1845 to 1850. The New York Juvenile Asylum, the DeMilt Dispensary, and the Northwestern Dispensary were founded by it in the early fifties. The Society for the Relief of Ruptured and Crippled Children was founded by it in 1862. It interested itself in pure milk legislation in 1864; in tenement house inspection in 1878. It began its fresh air work in 1883, and built its People's Baths in 1891. It started vacation schools in 1894, and vacant lot gardens in 1895. Through its initiative the City and Suburban Homes Company was organized in 1896. Three municipal baths were established through its efforts in 1902, and the Millbank Memorial Bath in 1904. A seaside hospital for the treatment of non-pulmonary tuberculosis was opened by it in 1904. A committee on the physical welfare of school children was appointed in 1906. In the same year a city branch of its fresh air enterprise was opened on the grounds of the Rockefeller Institute, and $250,000 raised for the Seaside Hospital. "Caroline Rest" for convalescent mothers was founded under its direction in 1907. Seven milk depots were opened in 1908, and the home visiting from dispensaries started. Its president for many years has been R. Fulton Cutting, known perhaps more widely as the head of the Citizens' Union in the successful campaign which resulted in the election of Mayor Low, and as an advocate of progressive legislation.

The position of general agent of such an association, who is its chief executive officer, is therefore one of great importance. The range of its influence, the effectiveness of its efforts in living up to the name of the association, are limited only by ability to secure popular approval of its recommendations and adequate support for its undertakings. Among those who have occupied the position are William H. Tolman, now of the Museum of Safety Devices, Frank Tucker of the Provident Loan Society, William H. Allen of the Bureau of Municipal Research, and Robert W. Bruère, lecturer and writer.

JOHN A. KINGSBURY.

The newly elected general agent of the New York Association for Improving the Condition of the Poor.

Mr. Kingsbury, a worthy successor, lived until four years ago in the state of Washington. He was educated in the public schools of North Yakima, Wash., where he taught for three years, and was principal of the schools of Prosser, in the same county. After three years as superintendent of schools in Georgetown, a suburb of Seattle, he was principal of one of the largest schools in Seattle. While in Georgetown and Seattle he studied at the University of Washington, particularly in the departments of social science and education. In 1906 he entered Teachers College, Columbia University, to prepare himself more adequately for educational work, but at the beginning of his second year, at the request of the secretary of the State Charities Aid Association, he was induced to take charge of the work about to be undertaken for the prevention of tuberculosis in New York state outside of New York city.

The progress of this campaign is well known to the readers of THE SURVEY. It is undoubtedly the most intensive campaign carried on in any state. It has had unusual results both in the way of legislation and of the establishment of hospitals, sanatoriums, dispensaries, visiting nurses, and other remedial agencies. In its second year, 1908, it secured a law requiring registration of cases of tuberculosis throughout the state, and providing for sanitary supervision, under the direction of the health officers, of all cases of tuberculosis in their homes. This law, which drew some of its provisions from Maryland and some from Wisconsin, has been enacted, with or without modifications, in a considerable number of states. In 1909 it secured legislation authorizing the establishment of a county hospital for tuberculosis by every county. The educational work of the campaign culminated in a conference of local committees on the prevention of tuberculosis, held in Albany last March, at which President Taft, Governor Hughes, Dr. Simon Flexner and Robert W. deForest spoke, and Joseph H. Choate presided. A constructive program, concisely stated in the phrase, "No uncared for tuberculosis in 1915," was adopted.

At the meeting of the board of managers of the State Charities Aid Association held in November, satisfactory progress was reported in the realization of the "1915" program. Already seven cities of the state have a hospital or sanatorium, a free tuberculosis dispensary and a visiting nurse for tuberculous patients. Sixteen other cities have two of these three agencies, and six have one of them. The number of cases of tuberculosis reported to health authorities, excluding New York city, Albany and Yonkers, which do not report individual cases to the State Health Department under a special statute, has increased from 22,098 in 1907 to 32,887 in 1909; and during the first nine months of 1910 is at the rate of 36,306 a year. The number of deaths from pulmonary tuberculosis in New York state, outside of New York city, which was 5,410 in 1907 and 5,449 in 1908, was reduced by 136 in 1909; and the present year shows a reduction thus far, as compared with a similar period of 1908, of 283.

The 4,000 members of the local committees on the prevention of tuberculosis throughout the state, which have been organized largely through Mr. Kingsbury's efforts, will be interested to know that he has been elected a member of the State Charities Aid Association, and will serve as a member of its committee on the prevention of tuberculosis. Thus his interest and participation in the success of the "1915" program will continue.

Mr. Kingsbury's rise in three years to one of the most important executive positions in social work in the country is a striking illustration of the possibility in this field for rapid advancement to positions of great responsibility and large opportunity. Of his personal qualities it would be a pleasure to speak at length, as it has been a pleasure to work in intimate association with him during the past three years. His enthusiasm for large undertakings, his remarkable energy, his intuitive sense of large opportunities, and his temperamental liking for public questions and public movements, all of which have contributed so largely to the success of the tuberculosis campaign, will find ample scope in his new position. The secretary and the assistant secretary of the committee on the prevention of tuberculosis have spent many pleasant and some wearisome hours together in the course of the last three years. Each is inclined to attribute to the other a large part of whatever degree of success the work has met with. Probably the fact is that the qualities and aptitudes of the two workers supplemented each other to a rather unusual extent, and rendered co-operation as effective as it was congenial.

TOMFOOLERY WITH PUBLIC HEALTH

THE PRESENT PITTSBURGH SITUATION

SAMUEL HOPKINS ADAMS

Two agencies only can redeem a city hygienically. A devoted, energetic, courageous and forceful official health organization can do it. Or an aroused and fiercely vigilant public opinion, led by the co-ordinated enthusiasm of the medical profession, may succeed, by forcing a lax officialdom to sustained action. At the present writing, two years after the report of THE SURVEY on Pittsburgh's public health, neither agency exists. This is, perhaps, a dangerous assertion to make in the face of a notably lowered death rate. But the decrease in mortality is due in part to a fortunate subsidence in epidemic disease; in part to the establishment of a purified water supply in which the present Health Department had no share, and in part to the efforts of a supplanted official whose work is being slowly undermined by the counsels of political expediency.

In May, 1909, Pittsburgh took a step forward. What had been a mere subagency of the Department of Public Safety was freed from unscientific control, and was constituted an autonomous Department of Health. The legislation which resulted in this development was one of the progressive steps with which the new administration of Mayor William A. Magee was identified, in its initial stages. Dr. James F. Edwards, the former head of the Health Bureau, was the choice of the medical profession for executive of the new department. He had demonstrated ability, a practical and scientific grasp of the difficult situation, and (perhaps too much) independence of political pressure. Public confidence was behind him. He knew the city. His familiarity with the strategic conditions of the never-ending warfare was expert. He was eminently the man for the place. Mayor Magee appointed Dr. E. R. Walters.

In that appointment Pittsburgh took a step backward toward the twilight-zone of practical politics. The backward step was not as long as the forward step achieved in the establishment of the Department of Health. But it was, nevertheless, a serious and damaging move. Medical confidence was at once diminished, for Dr. Walters is by no means of the scientific caliber appropriate to so vitally important a position. Nor was public confidence inspired by the appointment, which was not only purely political, but of a peculiarly unfortunate political bearing. Dr. Walters had been the president of the notorious grafting Councils, many of whose members are now under indictments or in jail. He himself is under indictment for bribe-taking; but, as his case has not yet come to trial, it would be manifestly unfair to draw any conclusions as to his guilt. Assuming his innocence, Dr. Walters is, nevertheless, until cleared, an object of suspicion to his fellow citizens. On this ground Mayor Magee has been urged to suspend him pending trial. He has refused.

To the mayor's credit, be it said, Dr. Edwards has not been dropped from the department. He was made superintendent of the Bureau of Infectious diseases, perhaps the most important sub-division of the department. Even in his own bureau, however, he has not been supported by his immediate superior, and some of his most far-reaching plans are in danger of proving abortive on this account.

In considering the statistical estimate of conditions, I am confronted at once by a discrepancy between Pittsburgh's figures and those of the United States Census Bureau. Long experience with similar phenomena in other cities, leads me to pin my faith to federal, rather than local, statistics. Pittsburgh claims a death rate of 14.6 per thousand of population. The census gives it a death rate of 15.8. Accepting this latter figure, the mortality is not only creditably low for a city of Pittsburgh's size, but is also a marked decrease from the mortal-

ity of former years, being the lowest in the history of the city. For convenience of consideration, I will list the important divisions of preventable mortality, with comments under each head.

INFECTIOUS DISEASES

The estimate of the department is 1,600 deaths from this cause, a decrease of 396 from the year before. This is largely due to a severe epidemic of measles in 1908, which, subsiding, immunized the city to some extent, so that the death rate from this cause was low in 1909, the decrease in favor of the latter year being 203 deaths. Typhoid fever is also listed under this head, but will be considered separately; as will also infant mortality from diarrhoeal ailments. Credit must be given for the general decrease (apart from typhoid and measles) to the efficient work of Dr. Edwards as head of the Bureau of Infectious Diseases. An important element in the control of infections is medical inspection of school children, since it is largely through schools that the actively contagious diseases are spread. Director Walters, whose strong point is his ability to get his recommendations approved by Councils, has succeeded in obtaining an appropriation for thirty medical inspectors of schools. There has been great delay, however, in making the appointments. This is ascribed to politics. An illustration of how politics was to dominate the new school inspection service in which the health of children was at stake, is the case of a young physician. He had done two years' inspection work for a progressive district school board, and his name, with the board's endorsement, was suggested for an inspectorship. He was told to get the endorsement of his local republican boss! In the early fall, at the demand of civic organizations, the administration was restricted to an eligible list of candidates who should pass a competitive examination before a board of physicians appointed by the Civil Service Commission. Against this Dr. Walters fought openly, but the wave of timely protest overrode him. It is feared, however, that the same influences will still find a way for manipulating the staff for political rather than for hygienic ends. The chief inspectorship was exempted from competitive civil service requirements, and Dr. Burns, leader of the administration forces in Select Council, was appointed to the post, after resignation from Councils.

Provision was made also in the appropriation ordinance of 1910 for the appointment of ten school nurses, but they have never been appointed. No one seems to know why.

TYPHOID FEVER

For many years Pittsburgh was the greatest sufferer among American cities, from this preventable and inexcusable scourge. Now the city may fairly be said to have conquered the pest. The dominant factor has been the delayed filtration plant which was put into operation in 1908, at the outset of a sustained period of low morbidity throughout the entire watershed. With some portions of the city still drinking unfiltrated river water, the deaths, nevertheless, have fallen to 22.7 per 100,000 of population. Consequently it is not too much to predict that, with the creation of filtration facilities for Allegheny voted in the bond issue passed in November, 1910, with competent control of the filtration plant (competent enough to protect automatically the city against epidemic by pollution of the water by the upriver towns), typhoid will shortly become a comparatively unimportant cause of death—as it should be in every community calling itself civilized. Competent control, however, is an essential. And here Pittsburgh may wisely keep a watchful eye on its politicians. Morris Knowles, a sanitarian and engineer of national reputation, the official who supervised the building of the filtration beds resigned last summer from the city service because he would not stand for the persistent application at that time of methods at the city filters which he believed to be unsafe. His departmental superior, who made Mr. Knowles's position untenable, is a former coroner of Allegheny county, and by a singular, not to say sinister, coincidence, is, like Dr. Walters, under indictment. Dr. Vaughn once observed that for every death from typhoid,

somebody should be tried for murder. Pittsburgh will do well to identify the men responsible in case of a return of the death-dealing scourge.

INFANT MORTALITY

Here the best work has been done. Under Dr. Edwards's plan the city was divided into six districts (later, increased to ten), each district having its own milk dispensary and a visiting nurse whose duty it was to make house to house visits, giving care to sick babies and instruction to ignorant mothers. There can be no doubt but that the good milk from the dispensaries and the educational influence of the nurses were potent in bringing down the death rate from Pittsburgh's chief single cause of mortality, diarrhoeal diseases in children under two years of age. Dr. Edwards's own figures show that 42 less babies died from this cause in 1909 than in 1908. But the census statistics are far more favorable than his own. They show 735 deaths under two years of age from diarrhoea and enteritis in 1909 as against 822 in 1908, a decrease of 87. This milk system, even in its initial and but partially developed years, thus brought municipal resources and equipment into a field of work, which for many years had been pioneered with excellent results by the Pittsburgh and Allegheny Milk and Ice Association. Moreover, the city itself was accepting responsibility for the health of its helpless babies; a notable move forward. But again Director Walters represents the backward swing of the pendulum. Early in the fall, with a large balance of the milk fund still on hand, he abolished this invaluable work. The Milk and Ice Association protested. So did Dr. Edwards. His superior pointed out that the period for which six nurses were appointed had expired. This seems rather a pretext, in view of the fact that Councils had given to the Health Department the power not only to carry on the milk and nursery work, but also to employ four additional nurses. The Milk and Ice Associatoin is still in the field. But, so far as the city concerns itself officially, the babies may die of poisoned milk, as before.

TUBERCULOSIS

Pittsburgh's situation in respect to this most terrible of all scourges is desperate. I know of no other word by which adequately to characterize it. Not that it is worse than in many other American cities. Indeed, the whole problem of tuberculosis seems to me to be growing constantly graver, in a national sense. And Pittsburgh fitly exemplifies the gravity of the situation. On the basis of 551 deaths from pulmonary tuberculosis alone in 1900, there were, roughly, 5,500 cases in the city. The census mortality figures of 576 cases would give about 5,750 cases. The total capacity of the city institutions capable of caring for a consumptive, including the poorhouse, is little more than one hundred. Perhaps one hundred more can be sent to the state hospital. True, there are dispensaries, private and public, including the admirable state dispensary; and visiting nurses, both publicly and privately maintained. Little enough can they do toward stemming the tide. There are today nearer 4,000 than 3,000 consumptives in Pittsburgh who are in a condition to radiate the infection. Wisely the city has voted a quarter of a million dollars for a municipal tuberculosis hospital; and work upon it will be started soon. The Tuberculosis League, with its insufficient means and equipment, is doing valiant work, with special emphasis on the educational phase. The Tuberculosis Commission from which so much was hoped is all but moribund. This condition is charged against Director Walters. It is stated that he has never taken the trouble to fill the vacancies now existing in the body.

One hopeful fact is the increased reporting of new cases of consumption. In 1909 2,407 cases were reported, a great increase over previous years, when the reporting required by law was the merest farce. Even now, less than half the cases are officially brought to the attention of the Health Department; but at least there is indication of a healthy awakening and improvement on the part of the medical profession. The most valuable report available on tuberculosis in Pittsburgh has never been published. It is the findings of a house-to-house can-

vass made by the visiting nurses of the Tuberculosis League, and turned over to the Health Department. The league would be interested to know why Director Walters has not published it, but cannot find out.

FOOD AND SANITARY INSPECTION

In the matter of inspection and guardianship against danger from unsanitary conditions of housing and food, there is matter for both encouragement and discouragement. Meat inspection is improved; there is a fairly thorough watch upon the stockyards and the large packing houses, and the sanitary condition of the slaughter houses has improved. Yet an average of 7,411 animals per week were slaughtered in 1909, without inspection. The report of the Division of Meat Inspection for 1909 recommends the establishment of a municipal abattoir, and promises to slaughter, dress, cool, refrigerate and store all animals without cost to the butcher, and still make a profit to the city by the sale of the by-products.

While the quality of the milk sold in Pittsburgh is probably improving somewhat, owing to the education of the dairymen, there is still nothing which can be regarded as adequate inspection. One lone dairy inspector had been, up to November, 1910, supposed to look after conditions in the 8,000 dairies which pour their milk into the city. The inadequacy of this service is too ridiculous for further comment. Three additional inspectors, however, were appointed late in November and provision made for four more, so that there will be one official for each thousand dairies, instead of one for eight thousand. This status still lacks something of being a guarantee of a pure milk supply. There are also milk inspectors whose duty it is to watch the places where milk is sold. One visit in two months is the best average they can maintain. This has its value as a club held over the dealer; but as "inspection" it is otherwise farcical. Formaldehyde and the dangerous adulterants, however, have practically disappeared. Of wide-reaching importance also is the new milk code establishing a basis of bacterial count for the sale of milk in the city.

It is in the Bureau of Sanitation that the exercise of the political pull is most frequent. Illegal tenements, disease-spreading outhouses, filthy cellars used as habitations, all are reckonable in terms of profit and loss, more accurately, and unhappily with more immediate appeal, than in terms of life and death. Hence the work of a political Health Department is reflected in its sanitary activities. "The Bureau of Sanitation has just completed a very active year," says Director Walters in his report for 1909. The activity seems to have been mainly in the line of making visits. And the visits were apparently visits of courtesy. There seems to have been little enough outcome of them. No city has worse tenement conditions than Pittsburgh. Yet as a result of 51,187 inspections in 1909, "living accommodations have been improved in 565 houses," and *six* tenements have been torn down or vacated! The special and crying shame and danger of Pittsburgh has been its old-world, unprotected, filth-disseminating back-yard privies. In 1907, when Dr. Edwards had full swing, 3,590 of these nuisances were abolished. In 1909, the "very active year" of Dr. Walters's administration, 345 were removed. And there are thousands left; 18,000 the report states, though I believe this to be a wide overestimate.

HOSPITALS AND VISITING NURSES

In my former review of the situation, I spoke of the hopeless lack of co-operation, in the private and semi-private health agencies; the guerilla warfare, where the situation imperatively demanded an organized and ordered plan. That lack still exists. But it is no longer hopeless. The Western Pennsylvania Health Conference, held the last of November, took hold of the problem and took hold of it with vigor and promise. In the course of the discussions, it appeared that there are fourteen dispensaries in Pittsburgh, each working independently of the others; that there are seventeen associations maintaining nurses, who do their work with little or no reference to each other's efforts or capabilities; and, in and about Pittsburgh, thirty-three important hospitals, every

one of them going headlong about its business of life-saving as if it were the one and only agency in the field.

Most of these institutions were represented at the conference; and a great majority of the representatives declared unequivocally for complete co-operation under any plan which promised to be feasible. Only among the hospitals was there any marked opposition. One representative spoke most earnestly for individualism in hospital work: "individualism fostering that friendly rivalry which alone makes for the best results." Individualism in public health work! As wisely advocate the principle of every man for himself in warfare, for a public health campaign is warfare of a highly specialized kind. Our American aborigines, I believe, practiced the individualistic style of fighting, but I have never heard that they won many battles thereby. Happily, the earnest representative of mediaevalism in hospital methods found only a few supporters. There went forth from the meeting some hundreds of practical and able men and women, with the formulated beginning, in their minds, of the idea of a city-wide co-operation. That, in itself, is a move of vital importance, sufficient and more than sufficient to justify all the time and toil expended upon the Health Conference, and to vindicate the judgment of the Associated Charities, which promoted it.

To sum up, Pittsburgh's advances are as follows: The establishment of an autonomous health department; a prospective tuberculosis hospital; food inspection somewhat improved; a good milk code, and increased guardianship of milk supply; a brilliant, though not complete nor permanently assured victory over typhoid; a creditable reduction of infant mortality; a promised system of school inspection; improved reporting of tuberculosis.

Its retrogressions are: Increase of political influence upon public health control; failure of the Tuberculosis Commission; failure to provide an adequate system of garbage and rubbish disposal; the forcing out or relegation of expert officials to subordinate posts; relaxation of sanitary guardianship.

Back of all purely official conditions lies the question: What does Pittsburgh really want? Does it want, as a city, sound health? Does it want sound health enough to strive for it, to fight for it, and, finally, to pay for it? The human body fends off death only by unremitting effort. The body politic is not essentially different from the individual in its warfare against the germ. To make a little fight and then relax will not do. Pittsburgh is now in the period of relaxation. If the city is to establish its forces on a war basis there must be concerted effort, eternal vigilance, some sacrifice of material considerations, and the education, not of a part, but of the whole, to the fundamental truth that when you attempt to combine practical politics and public hygiene, you are trying to mix oil with water, a death-agency with a life-agency. Finally and primarily, Pittsburgh needs another field-general. The wrong man is carrying the flag.

Sometimes it happens that a city is roused to hygienic reform only by the terrible lash of epidemic disease. Panic, misery and death drive the lesson home. If I use words of sensational import, it is because I have seen other communities, struggle up, stricken and weakened, from the morass into which their own neglect or fatuity has plunged them, The great city of steel has only half learned its lesson. If the medical profession lives up to its highest ideals, if the physicians prove indeed to be *doctors*—teachers of the people—the lost ground may yet be recovered. And I have thought to feel, on this last visit of inspection, an awakened professional and ethical consciousness in the medical fraternity; a bracing together for the fight, a tacit acceptance of the subtler responsibility of the physician for the public health. Definite signs are not lacking; the increasing interest of the medical men in organized hygienic work; the greater respect for technical public health regulations hitherto disregarded; the reorganization and regeneration of the city's representative medical college on a sounder ethical basis; and finally, the hearty and universal support of the Health Conference, which cannot fail to have an awakening and an inspiring effect upon all Pittsburgh.

COALESCING A CITY'S HEALTH FORCES

THE PITTSBURGH CONFERENCE

Co-operation and social service were the key-words of the Health Conference held in Pittsburgh November 29-December 1, under the auspices of the Associated Charities. Dr. Richard C. Cabot of Boston, in summing up the results of the thirteen sessions, said he did not know of any conference of the kind before held anywhere. He said that he was going home with the determination that there should be such a series of meetings in Boston.

Canfield in the Pittsburgh *Sun*.
AN OUNCE OF PREVENTION.

Among the characteristics of the working scheme of "The Western Pennsylvania Public Health Conference," to quote its full title, were the following:

1. Preparatory work covering a period of six months and involving the organization of a committee of three hundred which, through its officers and nine sub-committees, made all arrangements for the conference.

2. Eighteen dispensaries, seventeen nursing associations, thirty-five hospitals, three anti-tuberculosis forces, three city departments and a number of other philanthropic agencies brought together, through representatives, on the preliminary committees and the program.

3. Eight out-of-town speakers of national standing.

4. One hundred and one local speakers definitely announced to take part in the discussions, while others, unannounced, spoke extemporaneously at various sessions.

5. Three organized sessions daily, for three successive days. 10 to 12 A. M., 2 to 4 and 8 to 10 P. M., in one of the largest meeting places in the city. An extra luncheon conference down town and a "young men's rally" at 4:30 on the last day were added to the regular schedule. Informal luncheon conferences from 12 to 2 daily with a dozen extemporaneous short talks on topics suggested by the morning session.

6. A detailed printed program, suggesting practical means of co-operation and service in a series of questions and themes, brought out the main elements in the situation before the conference.[1]

7. Exhibits displayed in the large corridor and adjacent rooms around the meeting hall, dealing with such subjects as Infant Mortality, the Prevention of Blindness, Tuberculosis, the work of various local Hospitals, the Milk Commission, the Health Department of Pennsylvania, the Children's Bureau and the Associated Charities.

8. Extensive advertising, including a series of personal letters to a special mailing list of 7,000 selected persons; many columns of reading matter, pictures and cartoons in seven dailies and eighteen weekly papers; display cards hung in the reception rooms of doctors, vestibules of churches and hallways of philanthropic institutions; 27,000 invitation circulars distributed in the packages delivered by five department stores; six large banners stretched across prominent city streets; street car sign cards donated by private advertisers; invitation notices in the newspaper advertising space of business firms; posters on the front dash boards of street cars; pasted seals on private correspondence; and 9,000 copies of the twenty-page program mailed in advance to appropriate people. There were also several preliminary meetings, in which plans for the conference were discussed and interest aroused. These included a complimentary supper, to which the president of the Associated Charities invited representatives of the twenty-five daily and weekly newspapers.

These extensive efforts at advertisement and the enlistment of interest are mentioned as characteristic features of the conference, because the fundamental purpose of the conference was Community Education, as set forth in the opening statement by the chairman of the committee of three hundred, Dr. William H. Mercur.

Dr. Sidney E. Goldstein, formerly assistant superintendent of Mt. Sinai Hospital, New York city, delivered the principal address at the opening session Tues-

[1]This was declared by many people to be an educational document in itself. It is suggestive to residents of other cities. Copies can be had from the secretary of the conference, Charles F. Weller, secretary, Associated Charities, Fulton Building, Pittsburgh.

day morning. He was able to speak specifically of Pittsburgh health problems which he had investigated for the Pittsburgh Survey. His advocacy of co-operation, social service, and the development of a central hospital and health bureau was echoed or stated in various ways by many subsequent speakers. Six local speakers took ten minutes each in discussing the unorganized ambulance service, the excessive number of general hospital bids already available, the need for conferences as to rates to be charged to corporations and others, and the need for differentiation of hospitals as to territory covered or cases treated.

Dr. Cabot, who attended every session and contributed to the discussion at each, opened the Tuesday afternoon meeting with an address on Dispensaries: Their Place and Function; Methods of Co-operation Among Them; Their Responsibilities for Affecting the Home Conditions and Home Care of Patients. He condemned the hasty, superficial, medicine-giving methods of many dispensaries, where neither real diagnosis nor adequate care is possible. Representatives of the eighteen local dispensaries followed with five-minute responses, in which a cordial and growing spirit of co-operation was generally expressed.

Restoration and Prevention was the subject for Tuesday evening. Dr. Cabot and Dr. Samuel G. Dixon, commissioner of the Pennsylvania Department of Health, discussed the Development of Social Service and the Human Interest Point of View, Side by Side With Professional Skill and Material Equipment.

Nursing was the topic for Wednesday morning, with Adelaide Nutting of Teachers College, Columbia University, as the leading speaker. She was followed by representatives of the seventeen local nursing associations, who discussed her suggestion that a central, inclusive visiting nursing association should be developed.

Dr. Henry M. Hurd, superintendent of Johns Hopkins Hospital, opened the discussion on Wednesday afternoon of Hospital Co-operation. Representatives of the thirty-five hospitals were listed to take part in the discussion with five minute talks and nearly all responded. Various attitudes were expressed, but there was abundant evidence of the development of a sentiment favoring the co-ordination of hospital work.

Efficiency and Finance in their bearing upon health agencies were discussed Wednesday evening by William H. Allen of New York and three prominent Pittsburghers, who treated the problems of subsidies, public supervision, financial support and efficiency tests in a stimulating way.

Children's Health Agencies were described at the Thursday morning meeting. Nine local speakers, including Dr. J. F. Edwards of the Health Department, took up such subjects as infant mortality, backward children, obstetrical conditions, sex hygiene, the prevention of blindness and the importance of keeping infants with their mothers. Thirty babies in their mothers' arms, were introduced to the audience by Dr. Amelia A. Dranga, who explained the work of the Milk and Ice Association and the principles of infant feeding.

Investigation and After-Care of Charity Cases, the subject for Thursday afternoon, gave Dr. Charles P. Emerson of Clifton Springs, N. Y., opportunity to make a very clear, convincing argument for social service work in connection with hospitals and other health agencies. Five local speakers, in ten-minute talks, discussed Self-Help, Investigations, After-Care, and the practicability of developing social service work either as a branch activity of each hospital and dispensary, as a department of the Associated Charities, or as an independent central philanthropy. The cost of the different methods was considered, and an argument made for the co-ordination of the work in a hospital and health department of the Associated Charities.

Young Men's Health Problems, Including Sex Hygiene, were discussed frankly at a special rally Thursday afternoon by Dr. Cabot, Dr. Emerson and Dr. Evans. Young men and boys of the local university, technical school, high schools, academies and various boys' organizations made up the audience.

Dr. William A. Evans, Chicago com-

missioner of health, opened the final session Thursday evening, when the general subject was Community Education. Five local speakers followed, suggesting ways in which the public schools, institutions of higher learning, churches, women's clubs and the public press may help in the campaign for the prevention of sickness and promotion of health.

All sessions were well attended. At each of the three morning meetings from about 150 to about 350 persons were present; afternoons, 200 to 400; evenings, 500 to 850. At the luncheon conferences from 100 to 250 were present. The young men's rally brought together about 400 men and boys.

Not only sustained, general interest, but genuine enthusiasm, was in evidence. "I feel," said one of Pittsburgh's physicians who gives much time to social service, "as if I had been taking a course of training. I cannot go to other cities to study social problems or learn what others are doing, but this conference has brought instruction to our very door. I have suspended all other work during these three days and I have felt well repaid."

Dr. Cabot, in a final review of the thirteen meetings, expressed confidence that Pittsburgh has the ideas, the spirit and the people to work out in this field of public health many of the suggested plans for co-operation, for social service and for preventive measures. Hospitals and dispensaries, he said, must grow into a larger realization of their position as public servants. Of his conclusion, the following is a free quotation:

> The specialist in every field needs the help of the social worker. The specialist alone falls into every kind of error. The physician tends to view his patient only as a "case." The lawyer is likely to regard his client as merely a witness, a defendant, or plaintiff. The teacher is in danger of being viewed by his pupils as hardly a human being, but rather a "fair game" for pranks.
>
> These specialists need the all 'round social worker with his all 'round view of human brotherhood. In this conference the social worker has called the medical man into this larger human conception and co-operation. The social worker needs also to press on and perform a similar service for the specialists in the church, the legal profession, and the schools.

DETROIT SEX HYGIENE CAMPAIGN

A. H. FINN
PRESIDENT DETROIT FEDERATION MEN'S CHURCH ORGANIZATIONS

The educational campaign on sex hygiene recently conducted in Detroit reached almost every inhabitant with at least the prime facts regarding the physical dangers and social cost of venereal disease. It came on the heels of a census report which shows a prodigious growth in industries and population in one of our older cities—for Detroit was founded by Cadillac more than 200 years ago—and fits in well with the growing civic consciousness which has recently found practical expression in many ways.

The campaign had its origin in a meeting of physicians and social workers over a year ago, followed by several later conferences, to discuss methods of combating venereal diseases. In the meantime a Federation of Men's Church Organizations was forming, which was formally organized in the early summer. Sex hygiene was one of the lines of social service proposed at the organization, and the two groups quickly got together on a program suggested by the federation. The Pastors' Conference, an organization of evangelical ministers, and the Federation of Women's Clubs promptly accepted an invitation to co-operate.

The Young Men's Christian Association had previously engaged Prof. Winfield Scott Hall of Northwestern University for a series of talks on the subject, and this plan was pooled with the other for a general campaign in charge of a citizens' committee representing the organizations named above and several others. The chairman was Dr. Rollin H. Stevens, and the secretary Eugene C.

Foster, who is boys' secretary of the Y. M. C. A.

On the Sunday preceding the campaign, publicity in the two morning newspapers began with a half page article describing the plan, giving the reasons for it and backed by the strong list of organizations taking part. For the next three days these papers and the three published in the evening had each day a carefully prepared article on the need for sex hygiene and what it means in the conservation of the race. The public was thus fully prepared for Dr. Hall's lectures, which came thick and fast, beginning Friday morning. To show the wide scope of the campaign, I give his schedule for four days:

Friday: Morning, to the boys in the Western Central and Eastern High Schools—miles apart; to the Federation of Women's Clubs at the Twentieth Century building in the afternoon, and before the Federation of Men's Church Organizations at the Woodward Avenue Baptist Church in the evening.

Saturday: At 10 A. M., at Central High School, to women teachers in public and parochial schools; at 11:50, at Cadillac Motor Car Company, to a mass meeting of shop men; at 7:30, to mass meeting of store and factory girls at the Y. W. C. A.

Sunday: At 2:30, to meeting of boys at the Y. M. C. A.; at 3:30, to a mass meeting of men at the Garrick Theater; at 7:30 to another mass meeting of men at the Y. M. C. A.

Monday: At 10 A. M., to the Pastors' Conference at the Y. M. C. A.; at 11 A. M., to a second section of boys at the Central High School; at 6:30, to a meeting of men at the Y. M. C. A., and at 7:30, to the physicians and students at the Wayne County Medical Society's building.

This was probably the most strenuous campaign Dr. Hall ever engaged in, and while it was wearing he gave himself unreservedly to it and captivated his audiences with his gracious manner, his vigorous presentation of a difficult message and his successful appeal to all that is noble and best in man and woman.

Following Dr. Hall's campaign, the Federation of Men's Church Organizations, the Federation of Women's Clubs and the Industrial Department of the Y. W. C. A. took up the important task of carrying the propaganda into local churches, clubs, school buildings, factories—wherever a hearing can be secured. Several physicians, both men and women, have volunteered as speakers, and as a result of this follow-up work an even greater number will hear the sex hygiene message than Dr. Hall was able to reach.

The campaign thus is not ended, but in fact only begun, and in order to put it on a permanent basis and to affiliate it with the national organization, it has been incorporated as the Detroit Society for Sex Hygiene. Dr. Stevens, who was chairman of the citizens' committee, becomes president. The vice-presidents are the Rt. Rev. Charles D. Williams, Episcopal bishop of Michigan; Mrs. George Y. Caron, and D. W. Springer. The treasurer is D. M. Ferry, Jr. The executive and advisory committees are made up of representatives of the various organizations and commissions working in solid phalanx against this evil.

It remains to be said that without the help of the five daily newspapers the campaign could scarcely have been so successful as it was. The whole daily press of Detroit—by name, the *Free Press*, the *News-Tribune*, the *News*, the *Journal* and the *Times*—is thus placed solidly in the small but growing list of newspapers which have the courage to speak out frankly on a subject for which there is crying need of publicity. *Saturday Night*, an ably edited weekly newspaper, had the following to say under an editorial entitled Ignorance and Innocence:

Thus far the Detroit Society for Sex Hygiene has been blessed with wise counselors. The campaign has been opened and continues without sensation or morbidity. Best of all there is no emotional and misguided crusade against the unfortunates of the underworld. The force of the movement has been directed against the custom of sending boys and girls into the streets unwarned and therefore unarmed; against the suppression of facts pertaining to the one element of human life that causes the greatest misery; against the quack doctors with their hateful graft and their cruelly dishonest practices. Knowledge of these things will not bring all sexual crimes and indiscretions to an end; but it will be highly prophylactic. It will help every parent to meet the perplexing problem of how to bring up children safely amid the multiform temptations of a great city. And it is on the parent that the campaign must depend for its largest measure of success.

THE ROCHESTER BRICK CHURCH AND INSTITUTE.

This is a "downtown church," the fourth largest Presbyterian church in the country, with 2,400 communicants.

A SIGNAL EXAMPLE OF CHURCH SOCIAL SERVICE

KATHARINE STEBBINS

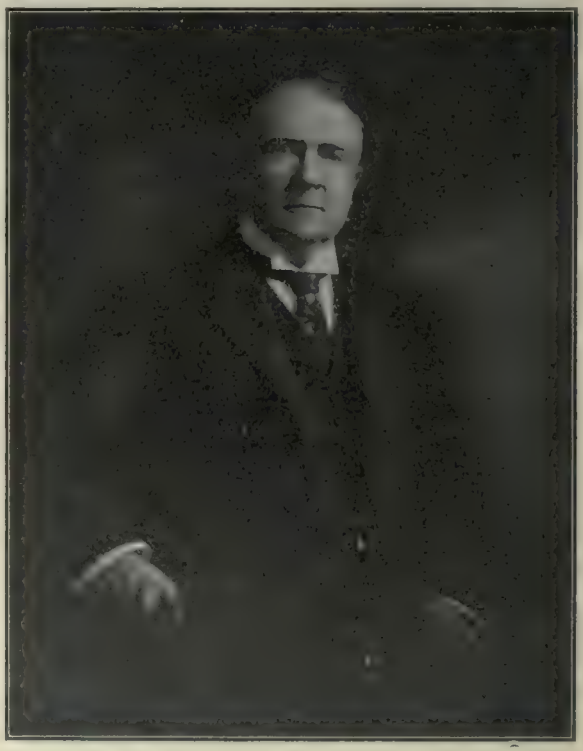
The reason for writing this article is implied in the title itself. It is because the Brick Church Institute of Rochester, N. Y., which was formally opened last June, is a signal example of what the church can do, must do, and is doing in the work of active social service. Social service is an idea which no longer needs to be defined. It is a phrase that is becoming more and more familiar in the press, in public speaking, and in casual conversation; and the weight of its meaning is bearing down upon us more and more heavily as the lines of its opportunities multiply and develop, and the horizon of its possibilities expands before our eyes. But in the minds of many the ideas of social service and church work are entirely disconnected; in fact, they have never been connected. Social service suggests progressive plans, up-to-date methods, expert direction; while much church work stands for kindly intention, narrow routine, and indefinite results. Needless to say this widespread impression is not a true one, for a rapidly-growing number of churches throughout the country are trying out some phase of institutional work and grappling with the problems of their own neighborhood. Indeed the very conception of social service was inspired fundamentally by the power of preaching, and its branches are now being directed by men and women who bear the impress of a deeply religious spirit. Nevertheless, it is true that many other churches, and many more individuals, consider conventional church work as one

HERBERT W. GATES.
Superintendent of the Brick Church Institute.

thing and the effort to provide amusement and instruction for boys and girls quite another. Indeed there are trained, conscientious workers who say openly that social settlements thrive best where the church is relegated to the background and the Bible taught in disguise.

Therefore, when the fourth largest Presbyterian church in the country erects and furnishes a building for social and educational purposes, at a cost of $105,000, and thereby proclaims itself not only in word, but in brick and stone, as a definite agency for the broadest, most comprehensive service it can perform for the community, the event is emphatically significant. It means, as William R. Taylor, the pastor of Brick Church, stated in his dedicatory address, "our recognition of the comprehensive unity of life, and it is a frank acknowledgment of the legitimacy of the impulses which lead people, and especially young people, to seek society, recreation and sport."

The Brick Church Institute is the unsolicited gift of one man, Henry A. Strong, a member of Brick Church congregation, the cost of furnishing being met by many generous gifts from others. It is a four-story brick building with basement, standing next to the church to which it belongs. It is sixty-one feet wide, 150 feet deep. In the basement are bowling alleys, gymnasium, a plunge bath, and meeting room for boys. The main hall or entrance lobby on the first floor is more attractive than that of many a summer hotel, with broad staircase, convenient office, comfortable wooden settees and chairs, and two large open fireplaces. Fine pictures hang on the walls, and a sense of comfort and hospitality is felt as soon as one enters. Just beyond the hall are church parlor, dining room, kitchen and gymnasium, while on the floor above are classrooms, an unusually large reading room, rooms for small clubs, and an assembly hall provided with a stage and two dressing rooms. The third and fourth floors are devoted to eighty-two sleeping rooms for men, each with a closet, two electric lights, steam radiator and call bell. There is a telephone on each floor. The rooms rent for from two to five dollars a week, and are an unique feature of the plant.



So far the institute is not unlike a modern Y. M. C. A. building or an up-to-date social settlement. The uses to which many rooms will be put are identical in all three, but in neither of the latter will be found one feature which the architect has provided for the institute. On the first floor, at right angles with the main hall, a passageway leads

directly to the church, and this passageway is symbolic of the ideas and ideals which have led the Brick Church from the pulpit to the classroom, and from recreation halls back to the church again. In every possible way this close connection between church and institute is being emphasized.

The formal opening of the building, which took place on a week night, was followed by a Sunday devoted at all its services, including the Sunday school, to the interests of both. At these services Dr. Raymond of Buffalo and Professor Coe of Union Theological Seminary spoke on various phases of the great problem—how to bring the church into helpful and recognized touch with the everyday, commonplace life of the individual and of society.

This problem is no experiment in Brick Church. Ten years ago its solution was attempted, and the present building was erected to supply the demands of a work grown at last to the proportions dreamed of by its superintendent, Winfred J. Smith. Dr. Taylor's confident hopefulness, his far-seeing wisdom, and personal inspiration have led his people into an opportunity of which this equipment, finer than anything of its kind in the United States, is but the tangible evidence. The greatness of this opportunity can hardly be overestimated. The time is come when, to represent Jesus Christ truly, the ministry of the church must consist not only in the stated preaching of the Gospel, but must be commensurate with the threefold ministration of Christ—teaching, preaching and healing. And if the church is to minister to the actual needs of humanity, it must control the formative forces which are turning the currents of our complex modern life. This need for a thorough readjustment of methods the Brick Church recognizes and is meeting in masterly fashion. To quote from a recent sermon by Dr. Taylor: "Our institute represents, first, our effort to conform our life and work as a church to changed conditions; second, to represent what Dr. Judson calls 'organized Christian kindness'; and third, our desire and purpose to do what we can to restore religious education to its proper place in the church."

To give special attention to this last named department, as well as to superintend all branches of the institute work, the service of Herbert W. Gates, of Northwestern University, have fortunately been engaged. Mr. Gates is an expert in this line, and from him, with his efficient co-workers and experienced advisory board, a large success is anticipated.

WILLIAM RIVERS TAYLOR.

Pastor of the Brick Presbyterian Church, Rochester, since 1888.

A MOTHERS AND CHILDREN'S BUILDING

HELEN SOLOMON

HELEN DAY NURSERY, CHICAGO.
A neighborhood center as well as a crèche.

The Helen Day Nursery, the daily shelter for children of working mothers in the congested Jewish district of Chicago, has completed plans for a new home at the corner of Union and Barber streets, opposite Small Park No. 2. The new building will be essentially a mother's building. Its activities will center not so much on the small child as on the mother and the family as a whole. It will aim to be, so far as possible, a constructive force in family life.

Social economy and justice ever more forcefully insist that the mother shall be the guardian of her own family; that she shall be the leading factor in the life of her own children. The Associated Jewish Charities of Chicago is bending its efforts toward a social organization which, so far as possible, will exclude institutional life for children. Pensions for mothers are to replace pay rolls in homes, and already an amazing number of families have been reunited.

Nevertheless, there still is and for many years to come there will be necessity for a day nursery in our congested district. While pleading for a recognition of the new ideal, authorities agree that the task is so great that no near future will bring the abolition of permanent asylums, to say nothing of temporary shelter such as a day nursery affords. The continuing wave of immigration of itself would make the existence of a day nursery imperative. Here the constant change of population is regularly registered. Each week brings to it new protegés whose parents are seeking a foothold in a strange land. Soon the immigrant family is able to adjust itself to the new surroundings and the timely assistance of the nursery has been instrumental in keeping another name from the list of applicants to the charity office.

Of the mothers in the Jewish district who apply daily at the nursery and whose names appear on the roll for an indefinite number of months or years, comparatively few work in factories and shops. The average applicant is the woman who receives some charitable relief which she supplements by her own small earnings. She peddles, or she scrubs and washes and does the occasional job which presents itself, or she keeps one of the stands which line the sidewalks. Her working hours are spasmodic so that she can have her children with her a good portion of the time. The day nursery has made possible the preservation of the home ties, for without its assistance her family would surely have disintegrated.

But the day nursery has not heretofore been inclusive enough in its policy. It has not taken into account the older children of the working parent whose babies it protects. It has not met the problem of the neglected "big" brothers and sisters, branded by the teacher as underfed, who have been tramping the streets after school hours. There is the little boy, our neighbor, who wondered why his mother "borned" him if he were forever doomed to return to a locked house between school sessions to find the crust of bread, his daily fare, left for him on the window sill. We recognize that it is the child in such circumstances, uncared for, left to run wild in the streets, who almost inevitably becomes a ward of the Juve-

nile Court. For him the nursery must be responsible as well as for the babies.

The new nursery will keep its doors open by night as well as by day. A "night nursery" for children whose mothers are employed as scrub women in office buildings after business hours is not needed in the Jewish district. But emergencies constantly arise and the nursery is handicapped in its efficiency because it is unable to keep children over night. Within the week one case of illness and one of death in families in which the nursery is interested, made it advisable to keep children out of their cramped houses for a night or two. Arrangements for temporary lodging can be made in some of the asylums, but the transportation of a child to a remote district for only a few days is seldom undertaken. For a home in which to leave a small baby temporarily deprived of its mother's care, the worker in the charity office is constantly at a loss. The new nursery will be open at all hours. The fact that its cases are referred to the Bureau of Personal Service for investigation insures it against abuse.

In outlining the work for its new home, the board of the nursery has considered every exigency which might arise. It plans to make the "mothers and children's building" a place where children who need shelter and protection by day or night may be cared for during the mothers' working hours; a place which shall provide temporary refuge in emergency; and an industrial, educational and social center for mothers, from which shall emanate standards of respectable living.

The new building will consist of two floors and a basement. In the basement will be storerooms and a fumigator, lockers, bathing facilities, a laundry and a domestic science room, the last for instruction in the proper care and feeding of children as well as in the essentials of sanitary and decent housekeeping, supplementing the work in the cooking class, with which the nursery co-operates, established by the Associated Clubs of Domestic Science in Small Park No. 2. These activities will extend the service of friendly housekeeping undertaken by the nursery several years ago. The gratifying results of this branch of the work have been due largely to two housekeeping funds—one of twenty-five dollars and one of ten, privately subscribed and contributed monthly, which have made it possible for the Home Improvement Committee of the board to clean up many a slovenly home and to start out many struggling mothers with a brighter horizon and a new idea of cleanliness.

The laundry will be open to the neighborhood, and instruction in washing, ironing and even scrubbing will be afforded. It is a well known fact that the earning capacity of some poor women is practically nothing because of their lack of skill in these branches of work, often the only means open to them of gaining a livelihood.

On the first floor will be a dining room, kitchen, doctor's office and an assembly room. The assembly room is to be equipped with sewing machines, and assistance in making and remodelling clothing will be offered. If the present plan is carried out, provision will be made to mend and patch garments contributed in an imperfect condition to the affiliated charity organizations.

The second floor has been uniquely designed to consist of a series of indoor porches. There are to be three dormitories, a playroom and quarters for the matron and her assistant.

The roof will be flat so that in time a solarium may be built. It may be adapted to any roof garden activity, but no definite plans for its use have as yet been formulated.

Of great advantage to the new nursery will be its location opposite Small Park No. 2. The older brother and sister entrusted to the care of the nursery are to be allowed the freedom of the park after school hours, and for smaller children there are wading pool, sand pile, swings and other paraphernalia. Through the past few summers a generous friend has provided a bus twice a week which has annexed Lincoln Park to the life of the crèche. This service has seemed invaluable, not only because it has transported the children and often the mothers from oppressive heat into a pure atmosphere penetrated by the lake breeze, but be-

cause these wonderful trips have revealed to the children of the slums an outlook beyond the squalor of the tenement. A nursery cannot allow its responsibility to end when it has provided shelter, for upon it the child is dependent for whatever of beauty is brought into its life. Park No. 2, the one bit of refreshing landscape in the vicinity, will be a continual source of helpfulness in this direction.

But has the responsibility of the nursery ended when it has given of its best to the child? Shall it close its doors contentedly each evening when the last of its babies, divested of the clean clothing put on after the morning bath, has been sent back in its rags to the stifling tenement cot? Several days or week may elapse before it is again brought in and then the set-back in health is disheartening. The home may be the natural place for the child even though it be better brought up and better cared for at the nursery; but who will wish without inquiry and without further effort to condemn it to the hopeless disorganization, the sordidness and ignorance of the typical slum home? The nursery's responsibility for the child does not end in the nursery. It holds its great opportunity in its relation to the mother and through the mother, to the home. It must be a real force in the education of capable mothers and in the organization of fit homes. The mother must be influenced to occupy her leisure to the best advantage of her children. She must be taught to make her habitation a real home, a place for which her children have a real home attachment. The new nursery will strive to be a factor in the home life of the community of which it is a part. It looks longingly to that utopian day when no mother need work, when every mother within its radius of activity will be able to make a happy, safe home for her children.

THE HOUSING AWAKENING[1]

III.

THE AWAKENING OF A STATE—INDIANA

ALBION FELLOWS BACON

When we wanted to awaken Indiana to her need for a housing law we had to ring and call and hammer. We cried, "Wake up, Indiana,—your system is full of poison, and it's time to take a dose of medicine." And the sleepy state half awoke, just enough to take the dose the Legislature gave it, but not awake in every extremity. Then it turned over again, and dreamed all sorts of dreams, and was very restless. But the medicine is taking hold of the poison. In a nutshell the method used to awaken our state was this—we learned all we could of the conditions, and drummed them into the ears of the public.

To get the flavor of our situation, you will have to know something of our conditions. See if you do not say, "Why, that sounds as if it might be in my own town." I am so convinced that our Indiana problem is, in the main, the problem of all states in the Union, with variations, of course, that I want you to tell me if our conditions are not typical.

Of course, our little unpretentious slums cannot compete with those of New York and Chicago and Pittsburgh, where the housing problem is so overwhelming that it has to be handled by machinery—rakes and steam shovels. Some of our cities need rakes, too, but in some we have to go at the slums with a microscope and tweezers. We realize that our cancer spots are none the less deadly because they are small. Yet that has been the hardest thing to teach the public, that slums are not a matter of size.

To begin with, the public had to be taught that what they had always

[1] The preceding articles in this series are The Housing Awakening, by Lawrence Veiller, in THE SURVEY for November 19. Price, 10 cents, and The Spread and Scope of Misery, by Carl D. Thompson, in THE SURVEY for December 3. Price, 25 cents.

thought were just poor folk and old houses were really slums. It sounded rather metropolitan—maybe that was why the idea took so well in the small towns. Another new thought was the responsibility of the landlord. We had not learned that the rent collected from our old death traps was really blood money.

The reason why our slum problem had not come to the front before was very likely because the slums themselves were in the rear. They were "out of sight, out of mind." You had to go down the alleys and the back streets to find them. That is why some of our good people did not believe we had any. They were so respectable, and went only on our nice streets, and the slums did not come their way. One woman listened to my tale of the poor and said, "Well, well! I never dreamed anyone lived like that in Evansville. But then I was never thrown among that kind of people."

Being a friendly visitor and the head of the Flower Mission, I had to poke around all kinds of places to find our poor. Drawn by the lure of wretchedness into the haunts of poverty, it was easy to learn where it hid away. The amazing thing was that all the places I found had existed so long without everyone knowing of them. Still, some of the worst places have a respectable front, and one never dreams of the horrors inside without going in to see. Doubtless that is true in all the towns in which people live.

Our campaign grew out of this Flower Mission work. I remember for the first time making a round of our tenements. The houses were shabby old rattletraps, dark and damp, with sodden yards full of ash piles and rubbish. The babies, the mothers, the walls, were all the same hopeless gray.

There did not seem to be any excuse for it, and I asked our secretary: "Why do not the landlords cut some windows in those dark rooms? Why do they not mend those dangerous stairways and those leaky roofs? Why do they not drain the yards, and put in hydrants?" And the secretary answered wearily: "They do not have to. The houses bring good rent anyhow, and there is no law to require it."

ALBION FELLOWS BACON.

No law! The poor had no legal right to air or sunlight or water! They could be charged rent for the house that murdered them! That was the beginning of our campaign—the cause of the war.

It always seemed strange to me that other friendly visitors should dwell on the persistent filthiness of the poor—as if, forsooth, they could be washed without water or dry without drains. None of our tenements had city water. Some-

SOME OF EVANSVILLE'S BAD HOUSING CONDITIONS.

times one cistern had to supply ten or more families, and then they had to be "sparin' of the water," one woman said, as she hung up her line of gray, half clean clothes. In one of our largest tenements, guiltless of drains, one of the top floor tenants eloquently poured her suds over the railing into the hall below.

It is the custom in the "Cotton Mill Block," also unprovided for waste, for the tenants to stand in the doors and unblushingly project dishwater, suds and garbage into the common yard space. Under the August sun the odor is sickening, yet the barefooted babies play over the scum. Of course they have chills there, and typhoid, as they do in many tenements where the seep water runs back into the open cisterns.

Tuberculosis is frightfully prevalent among our poor. In the tenements there are always sick cases; no wonder, with the horrible cesspools under the windows. People hive over warehouses and herd in stables, unsanitary and unclean, like the animals. Yet, with all of these conditions, our people did not know about it, except just a few. Our charity committees did not go to the homes of the poor—do your committees?—they sent the charities secretary, as most towns do.

What frightened me was that Jacob Riis said that fifty years ago the slums of New York resembled those of our larger western cities today. Does not that frighten you western people? Fifty years! What would our tenements be in that time? Would they be full of tortured bits of humanity, as those of New York are now? It got so that a procession of white-faced, wailing babies began to appear in the dead of night, and wave their tiny arms, and cry, "Sleep no more till we are cared for." When you get to "seein' things at night," you are ready for work.

Reports had been coming for some time from our other cities, showing conditions similar to ours. Careful inquiry bore out my conviction that every city, town and village in the state had a growing slum or a slum nucleus. There was good reason to believe that at least a preventive state housing law was needed.

All the charities secretaries over the state were strongly in favor of a housing law. They felt the need of it. Two of our most experienced and wisest leaders, Miss Rein of South Bend and Mr. Grout of Indianapolis who has done such splendid things in his city for better housing, warmly endorsed it and helped plan for it. Alexander Johnson and Dr. Hurty of our state Board of Health, always on the frontier line of reform, promised to help. Then, with Providence and the press on our side, what could not be accomplished?

On the other side, men of experience declared it would be impossible to pass a housing law at the first attempt, maybe not for four or six years. The virgin soil of the whole state would have to be broken up—and that makes hard ploughing—before the seed of the new thought could be planted. There was no organization ready to manage it, no money to pay for investigations or to hire secretaries or lawyers. The cause had few friends and there was bound to be opposition by landlords and builders. It looked pretty hopeless, but that did not make a bit of difference. The time had come to obtain a housing law, and when a thing ought to be done, and has to be done, it can be done.

There were two men whose encouragement outweighed all the millstones of the conservatives. They were Lawrence Veiller and Jacob Riis. No one will ever know how much help and comfort their counsel was all through the campaign. They said, "Go ahead, and get your state law." That settled it.

After that, a great hand seemed to be directing every movement. Somehow, the plans unfolded, the hearts of men were opened up to good influences, the path was made straight. Otherwise the law could not have been won in a year. It was a miracle, nothing less.

After talking the matter over with Mr. Grout, the plan of the campaign decided on was this:

1. To secure as full reports as possible of existing housing conditions all over the state.
2. To draft a housing bill to cure our old tenements, and prevent unsanitary dwellings from being erected. In other words, to check the incipient slums.

No congestion here.

Fourteen people in a two-room flat.

WHERE EXTREMES MEET—SOUTH BEND.

3. To enlist as many organizations and individuals as possible.

4. To secure the active help of all charity organizations in the state in educating the public.

5. To have photographs made of typical unsanitary dwellings in each city, mounted as posters, displayed there, and afterwards before the Legislature.

6. To have illustrated sermons and lectures all over the state.

7. To syndicate several of the largest newspapers in the state, and run a series of articles on "bad housing," local and general.

8. To present the subject to the state conference of charities.

9. To send personal letters, and literature on the subject, to each member of our Legislature.

10. To engage some prominent organization to superintend the passage of the bill.

Was not that last confiding?

Now, that is a very simple plan; but it did not fit in very well with housekeeping. Making laws and concocting soups and salads are widely different fields of action, and it took months for one pair of hands to write all those letters, being all hyphenated with domestic dashes.

First, there were the letters to all the secretaries of the charity organizations in the state, asking about conditions in their town and sending a questionnaire. Of course that is not the scientific way to investigate, but you cannot employ a corps of trained statisticians without money. While the pot was boiling, I went personally to some of the little towns that had no charity organization, to see if each had a young slum coming on. E. T. Hartman, who had initiated me into the principles of housing reform and given me invaluable instruction, had predicted that I would find a slum nucleus in every village. After wading around on foot, through dust and sand and cockle burrs, under the August sun, some of the rarest specimens of slums in our state were discovered. Typical houses, they were, that would disgrace a crowded city.

Then the answers to the questionnaire came in and settled all doubts of the need of a housing law. The answers were amazing. In Indianapolis a scientific canvass of one district had been made by the Charity Organization Society, and the Commercial Club. It showed that hundreds of families lived in crowded, dark rooms, without drainage, sewerage or water, light or air.

In the smaller towns the housing of the poor was uniformly bad. The startling revelation was made that in all our cities new houses were being built daily without windows, even the costliest flats. Of course, every report gave some specific cases in detail, so we had something accurate, surely enough.

If a ship comes into port with just a single case of cholera on board, that is enough to hold the vessel in quarantine. This may be way off the track, but it seems to me that if just one family is allowed to live in a town in squalid disregard of decency and health, there is something wrong with us if we pay no attention to it.

The next difficulty was to get a housing law that would fit our conditions. If

Mr. Veiller's Model Housing Code or his splended book on Housing Reform, had been published, it would have saved so much labor and mental agony. There was nothing left to do but compile the best laws to be found. But the laws made for the big cities would not fit our state. It was like making over grandpa's coat for little Johnnie to trim them down to our needs. Just to cut off the tails was not enough; they had to be taken up in the shoulders, and fitted all over. At last our bill was finished, and one of our best lawyers, J. E. Igleheart, went over it and tightened all the screws.

It was very trying, in drafting the law, to have to keep in mind the poor on one side, the landlords on the other, and the Legislature in perspective. How blithely could we have set about writing a law that would have made things as they really ought to be, if we could have planned for something more than mere decency—just space and water and sewerage! What joy it would have been to decree generous garden plots and noble outlooks, instead of meting out miserly air spaces; what pleasure to bequeath bath tubs with a stroke of the pen to future generations; to plan the City of Our Visions, instead of a City of Compromises!

The next thing was the publicity part. The presidential campaign was on and that engrossed the newspapers, but our plan was to serve up slums to the public, local and general, hot and cold, by articles, editorials, stories, cartoons, in every possible way.

Then there were letters to clubs and individuals, men and women of influence, ministers, teachers, politicians, candidates for office, to get their pledges. Each letter had to go over the lacerating story, to explain the new thought and the old need. Each one had to make a different appeal. For instance, a letter to a business man took up the commercial aspect—showed how bad housing was bad business. Letters to ministers dwelt on the moral and ethical phases. Letters to women's clubs dealt with the impossibility of making homes in the miserable tenements, with the environment of the growing child, the danger to their own children, etc. The purpose of these letters was to arouse public sentiment, and to get the persons addressed to bring pressure to bear upon their members of the Legislature.

Then came the letters to the 150 members of the Legislature. With each one went a copy of *Charities and The Commons*,[1] in which were an article and a strong editorial on the Indiana Housing Problem. The support of this magazine was a big factor in the fight, and the friendly help of the staff is something for which we must always be grateful.

Then the bill was presented to the State Charities Conference, and the Commercial Club of Indianapolis. A member of this club, Linton A. Cox, was in the Senate. Without his wise counsel and hard work the bill must have failed. After it passed he defended it in the lower court, and wrote the brief for the Supreme Court, all without pay; so you know he belongs to the tribe of Abou Ben Adhem, who "loved his fellow men."

Now the fight was narrowed down to the Legislature and every gun was trained on it. Our posters were taken to the State House and hung on wires along the corridor, as one hangs out a washing. It was a great privilege to address the joint committees to which the bill was referred, and still greater to address both houses of the Legislature, as most of the 150 men had to be won over to housing reform. Now, let me tell you that the "plain, unvarnished tale" of the poor was what counted—not statistics, not eloquence, not logic—and it always does count.

I used to think that line in Gray's Elegy was so fine, "The applause of listening senates to command.' Maybe in Gray's time it was not a joke to talk about "listening senates." But they did listen kindly to the story of the poor, and what bad housing meant to the poor, bad health, bad morals; and what it meant to the state—the cost of crime and disease and dependence, and the loss of efficiency of the working man. What took hold of the legislators, I think, was the horror of it, "the pity of it." That showed the chivalry in our men. It was like watch-

[1] *Charities and The Commons*, December 5, 1908.

A TERRE HAUTE SLUM "SAND BURR HOLLOW".

ing a tournament of knights to sit back and see the friends of the bill, in both houses, fighting for it. The landlords came in force, and it was a bitter fight. The beautiful thing was that the opposition did almost all the lobbying.

After a hard battle the bill passed, mangled and torn, but very much alive. It was cut down to only two cities, but we'll get all the others yet. It is a satisfaction, anyhow, to know that the slums of all the other cities have been ventilated, for once. Of course, the law was promptly contested. It is now in the hands of the supreme judges. Heaven send they may have mercy on the poor!

There would be little use for this recital if our case were isolated. I am convinced that if any of the readers of THE SURVEY were to take up a housing campaign in their state they would find the same need of reform, the same opposition. Their stronghold also would be public opinion. As soon as people know the truth about the slums, there will be no more slums.

There are some things the public will have to be taught. They must be taught that "the slum is the enemy of the home"; that it is not safe to let children grow up in filth and degradation; that the civic—the social—body is all one, and that one festering spot means blood poisoning to the whole body. Sooner or later the housing problem will demand the attention of every state in the union. If you wait till it forces legislation it will be too late. What is needed is to "head off the slums," as Jacob Riis says, now, while land is so cheap and so plentiful.

If we could only lift up our eyes and see the vast, unpeopled plains of our great country, and then have a vision of the crowded towns. There is so much room for everyone in our wide states, with plenty of sunlight in the fields, plenty of air on the hill tops. Yet men, in their blindness, go on building tiny boxes—coops, traps, dens—and call them houses. And they squeeze them together in bunches, and call them towns. And there sad-faced men and women stifle and die for lack of air. Sickly children droop in the close rooms or tumble about over the cinders; children that never played in the grass or daisies. And the voices of all these cry to you: "Give us sunlight and air! Give us room to breathe in and grow! Give us our birthright!"

SLUMS IN BERLIN

JOHN IHLDER
FIELD SECRETARY NATIONAL HOUSING ASSOCIATION

That the Germans are dealing courageously and to a considerable extent successfully with the great social problems is undisputed; but an impression has gone abroad in America that their success has been greater than facts seem to warrant. Notably is this true in the matter of housing, which by many students is considered the fundamental social problem. Germany has built, particularly in Berlin, and is still building, great "model" tenements with interior courts so large that they may be divided into children's playgrounds and gardens. While Americans and some Englishmen are hailing these barracks as triumphs, the Germans themselves are beginning to discover disadvantages and to turn their attention to securing for the worker and his family the benefits of the small house, or cottage, which has been in England and America (except for New York) the home of the people.

But it is not alone from evils inherent in tenements that the Germans suffer. Despite the proclamations issued on this side of the Atlantic that German cities have no slums, German cities apparently do have slums, or slum conditions, such as lack of light and air, overcrowding and utterly inadequate toilet facilities.

A committee of the Berlin Sick Insurance Fund for "merchants, tradesmen and pharmacists" publishes reports which give a distressing picture of the housing of what is far from being the poorest or worst-paid class of Berlin's population. These reports are based on investigations of the conditions under which beneficiaries of the fund are living. Among the beneficiaries are, in the words of the report, "sons and daughters of parents of the better class, who even in time of sickness are above want, as well as a considerable number of such as, by education and position, are used to better conditions of housing, and therefore spend on their housing more than is the case generally."

As its minimum standard the sick insurance fund committee takes a habitation or apartment having a floor area of 108 square feet, a height of eight feet three inches and a net cubic capacity of 540 cubic feet. Compare with this the New York requirement, in force since 1901, that in every new tenement house each apartment shall have at least one room containing not less than 120 square feet of floor area and each other room shall contain at least seventy square feet. Each room shall be at least nine feet high from the finished floor to the finished ceiling, except that an attic need be nine feet high in but one-half of its area.

The committee found that no fewer than 680 men—equal to 8.3 per cent of the total number of male patients visited, and 600 women—equal to 8.2 per cent of the total number of female patients visited—lived in rooms which were below the specified minimum of floor space; in fact, 166 persons were found living in rooms which did not measure even one-half of the floor area required. As regards the height of the rooms, 2,052 men (25.2 per cent) and 1,664 women (22.9 per cent) inhabited rooms which did not reach the minimum height. And lastly, 4,166 men (51.3 per cent) and 3,383 women (46.5 per cent) were deprived of the necessary minimum of cubic capacity of air; 2,591 persons did not have even one-half, and 133 had to be satisfied with less than one-quarter of the cubic air-space which is indispensable for a living human organism—and these were all sick men and women, some with tuberculosis!

The committee also reports that 372 men (more than 4 per cent) and 232 women (about 3 per cent) live in cellar dwellings. The bulk of the dwellings—over 80 per cent in the case of front tenements and nearly 98 per cent in the case of back tenements—consist of but two rooms and a kitchen, or less, while nearly 30 per cent in one case and over 50 per cent in the other were habitations consisting of but one room and a kitchen.

Moreover, the committee found that its patients were in the majority of cases sharing these small rooms with other persons—four, five, six and even more. Of the male patients living as lodgers only 43 per cent had a room to themselves. Of the total number of male patients 39 per cent shared the room with another person, 12 per cent shared it with two, and 3 per cent shared it with four. The conditions of those living with their families was much worse, no fewer than 30 per cent living with three persons and more. To make the picture a little more vivid, the committee reports that 115 persons of both sexes lived in rooms which had no window, 443 lived in damp rooms, and 1,452 had to share their conveniences with more than fifteen persons in each case.

It would be possible to match these conditions in New York and perhaps in other American cities, which are ignorantly congratulating themselves on having no housing problem. But in New York, where the Tenement House Department has been in operation for eight years, no new tenements erected in that time (and such tenements now house more than a million and a quarter persons) would call for criticism on the part of the Berlin investigating committee, while even the old buildings are being brought slowly up to a standard where they will cease to be downright breeding places of disease.

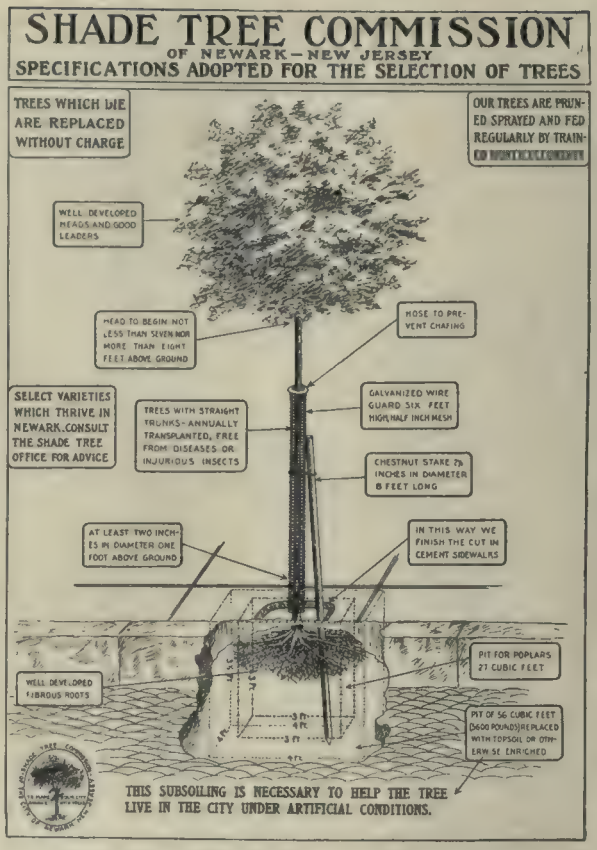
In other American cities, as shown by the series of articles now being published in THE SURVEY, the importance of good housing has begun to be understood and definite steps are being taken toward improvement. Germany has much to teach, but America should study the lessons she presents with discrimination, for America, too, has made considerable progress.

CIVIC IMPROVEMENT

CHARLES MULFORD ROBINSON, Contributing Editor

A VALUABLE BULLETIN

One of the best bulletins which come to this department—interest and value being considered—is that issued each week by the City Club of Philadelphia. This club aims "to gather into membership men of all parties, occupations and creeds from every geographical section of the city, who have in common a sincere interest in the betterment of municipal conditions in Philadelphia." It holds a weekly luncheon, at which an important address is made, which is followed by discussion. The bulletin has been printing this material. One group of papers has discussed in a very informing way what Philadelphia is doing in various respects for her citizens. Other typical subjects have been Scientific Appraisal of Real Estate as a Basis for Taxation, by Frederic C. Howe, and The Immigrant and Democracy in American Cities, by Grace Abbott.



THE BUTTERFLY

The butterfly seems a curious topic for a civic improvement department. One cannot improve butterflies; but once upon a time this testimony was borne: "The butterfly came and hovered over his head and re-inspired him." Accordingly, with this motto a Butterfly Association has been formed which takes as its purpose "the betterment of humanity irrespective of color, creed or race." It publishes a little monthly magazine of no more than leaflet size, but attractively printed and full of good quotations and short, thoughtful articles. One of the best in a recent number discussed Social Centers and Civic Progress. It began with these words, which are well calculated to set one thinking: "Out of the forest primeval came two crossroads, and the first social center was established. The social center is not a product of the past century, but has always existed, changing its form and function with advancing civilization."

PLAYGROUND OCCASIONS

The latest annual report of the Children's Playground Association of Baltimore is a handsomely printed and illustrated pamphlet. Of the reports which it contains by various officials and committees, perhaps the most interesting, because the most novel, is that by Mary B. Steuart, supervisor of playgrounds. Miss Steuart describes "Occasions." These to the number of thirty-six were given during the summer in various parts of the city, and were, she says, of the greatest value in bringing together in friendly relation children, parents, neighbors and directors. Each entertainment was a neighborhood affair. The children of the playgrounds were the actors, the parents and friends the spectators. There was a great variety. Some of the "occasions" were Mother Goose parties. Others were devoted to illus-

trated songs. Yet others to phantom dances, folk dances, etc. As Miss Steuart says, the possibilities of these local "occasions" are alluring. There is much in the various sections of a city, especially among the foreign people, which may be studied, and here made use of, to preserve traditions and folk lore, and to keep the younger generation in sympathy with the past.

HOW NEWARK'S CIVIC PATRIOTISM GROWS.

SHADE TREE PROTECTORS

This department has had occasion several times to refer to the activities of the very wide-awake Shade Tree Commission of Newark N. J. The commission has just done another interesting thing. It has organized the children in public schools of the city as shade tree protectors. The constitution and by-laws drawn up for the organization state that the objects of the league are "to inspire its members with civic patriotism, to inculcate in them a zeal for their city's beauty, to enlist them as volunteer aids to the Shade Tree Commission in its care of the street trees and parks, to propagate knowledge concerning laws and ordinances enacted and ordained to protect trees, to promote the setting out of new street trees and to urge young and old to maintain, protect and cherish existing trees."

Membership is open to pupils above a certain grade. Badges will be presented by the Shade Tree Commission to the officers of the league, and to such members as perform some service in the care or protection of the trees in their respective districts. It is optional with the league of each school whether or not dues shall be levied. The offices shall be equally divided between boys and girls. Meetings are to be held bi-weekly in summer and on the fourth Thursday of each month during the school year. Sergeants-at-arms shall be stationed at the entrance of the meeting room, "to prevent strangers from entering and members from leaving without permission, and shall aid the president in preserving order." The school district in which a league is established shall be divided into as many sections as the extent of the district and the number of trees therein may require. Each section shall be in charge of a foreman. Reports are to be made to the foreman, and these reports read at the meetings and subsequently sent to the Shade Tree Commission. There are to be occasional public meetings. The commission has issued, further, two interesting leaflets of instructions for the juvenile shade tree protectors.

A WOMAN AS MAYOR

The only person on whom the city of Oldham in England has ever conferred its freedom, is a woman. The first woman to be elected town councillor in Lancashire is the same person. She is Mrs. Charles E. Lees, and now she has been elected mayor of Oldham. In electing her, Oldham is the first of the great towns in England to place a woman at the head of its municipal affairs. The reason of these honors is set forth in the following statements taken from a recent London paper: "All ranks of townspeople are united in feeling that the honor is thoroughly deserved, for Mrs. Lees has for many years shown a high public spirit and noble devotion to duty. Her benefactions have been numerous, and so judiciously placed as to affect the well-being of every section of the community. Mrs. Lees has taken a leading part in the educational work of Oldham, and was instrumental in forming the Beautiful Oldham Society, which has already relieved the somber appearance of the town. In the opening of playgrounds she has played a useful part, and she gave eleven acres of land to the Hope Sunday-school, and another large estate as a pleasure resort. It is her ambition to see a playground in every congested area. As president of the National Union of Women Workers, Mrs. Lees has long pressed the claims of her sex, and is satisfied that there is plenty

of scope for women in housing and sanitation matters."

A STUDY OUTLINE

E. G. Routzahn, an indefatigable field secretary of the National Association for the Study and Prevention of Tuberculosis, has prepared a study outline on civics for use by Y. M. C. A.'s and other associations. Among the topics which he includes, the following are particularly suggestive:

Social and civic census: Need of real facts, not "supposed" facts. Listing and studying organizations and institutions of various kinds. The Know Your City Movement.

City plan: Its relation to health, economics and beauty. A "prophecy of practicable possibilities."

Expert knowledge: Need of checking all methods and plans by the experience of leaders. Sources of information: The use of "national" organizations or headquarters and of the organs of social movements, such as The Survey.

Literature: Periodicals, books, and other printed sources of information for study and propaganda. How to get people to read.

The press as a chief educational agency: Making it easy for editors to co-operate.

Speakers, topics and audiences.

Illustrative methods of propaganda: Exhibits, lantern slides, etc.

Committees or associations: Self-constituted "steering" groups. Co-operation between existing bodies.

Seeing big things and bringing them to pass by doing little things in a big way.

A SCHOOL TO BE PROUD OF

The town of Norwalk, Conn., has built a new high school of which it is justly proud. The building lot and furnishings represent a value of considerably more than $100,000. Because the town has so much reason to be proud of this school, it secured a special act from the Connecticut Legislature permitting the appointment of a committee, known as the High School Committee, charged with the task of developing the school's highest usefulness. This committee, of which the Rev. Dr. Charles S. Macfarland is chairman, consists of five members, each of whom serves in turn as acting visitor for a period of two months at a time. The chairman serves as general visitor, and is in the school practically every week of the year. The committee holds monthly meetings, which are open to the public and to which all persons having recommendations to make are invited. There are also some special meetings. The committee believes that the pupils of the school ought to become interested in the civic life of the community. To this end, not only is there appropriate study, but a movement is reported to interest the pupils in the care of the building and the grounds about it.

The deep interest of the citizens of the town in this fine new school is indicated by the generous gifts made to it. About half of the school library, which now contains six hundred volumes, was received in gifts. The list of casts, busts, statuary, portraits, other pictures and miscellaneous objects fills five closely printed pages. Probably no other school building in Connecticut is more attractive in its interior decorations. It only remains to be said that the committee has issued an illustrated and attractively printed report describing the school and its own activities. The whole matter seems to be one worth regarding as a notable civic achievement.

THE IMPROVEMENT SOCIETY'S SCOPE

Elkton, Md., is a small town which has lately been through the now happily familiar experience of a civic awakening. An improvement association has been formed, and a committee appointed to consider the scope and plan of the association's activities. This committee has brought in a report which has been printed in leaflet form.

The report is of interest for two reasons: first, the subject which it considers is being considered in a great many other towns, small and large; second, the treatment is of an unusually high character, as shown by the following extracts which deserve to be memorized by civic improvement workers:

"Town improvement associations are very numerous in the United States, especially in the eastern, middle and western portions of the country. They are usually promoted to give expression to the restless and unsatisfied longings of a local patriotism for improved conditions of living, for a higher order of citizenship, the cultivation of civic righteousness and the general uplift of the community. . . . Good citizenship is not made by law but by respect for the law; and the growth of public intelligence, through public discussion of a community's burdens and needs, is the surest preparation for the evolution of such laws as will relieve its burdens, supply its needs, and secure its respect. It is in this manner that these associations become auxiliary to legitimate authority. . . . A good citizen must have a sane mind in a sound body; he should delight in his surroundings; he should not incommode or oppress his neighbor; he should take pride in his own prosperity and rejoice in that of others and of the town."

Five committees are suggested: on general appearance of the town, on sanitation, on schools, libraries, holidays and amusements, on child-life and playgrounds and on industries. In addition, there is to be a general executive committee. An obvious criticism is that there is no committee on comprehensive town planning, but that is a matter which will perhaps be taken up by the committee which has to do with the general apppearance of the town.

FIGHTING THE BILLBOARD

The vigilant Outdoor Art League of San José recently devoted a whole page of one

of the local papers to a discussion of the billboard evil and how to fight it. The page contained several illustrations, which in their way were as telling as the articles, though the leading feature of the page was an extremely well written paper by Mrs. Charles Cox, on billboard evil and how to fight it. The page contained a large number of short articles telling what other cities are doing to abolish the billboard. And all these items, with the local pictures, made a very forcible presentation of the case.

LABOR LEGISLATION

JOHN B. ANDREWS, Contributing Editor
SECRETARY AMERICAN ASSOCIATION FOR LABOR LEGISLATION

FOURTH ANNUAL MEETING

At the fourth annual meeting of the American Association for Labor Legislation, in St. Louis, December 28-29, the principal discussions will be focused upon this organization's "immediate legislative program": (1) Prohibition of Poisonous Phosphorus in the Manufacture of Matches; (2) Investigation of Industrial Diseases; (3) Reporting of Industrial Accidents and Diseases; (4) Workmen's Compensation for Industrial Injuries; (5) Enforcement of Labor Laws.

FACTORY INSPECTION

Practically every industrial state is endeavoring this year to secure a more efficient system of factory inspection and better enforcement of the labor laws. Inspectors are selected under civil service laws only in Massachusetts, New York and Wisconsin. Massachusetts, long the leader in labor legislation, now has a state commission interested in bringing greater unity and efficiency out of a system which divides responsibilities and creates unfortunate friction between the district police and the Board of Health. New York, the only other state having medical inspection with comparatively large appropriations, is puzzled to find support for a sufficient number of inspectors to cover even hastily the growing field. Wisconsin, with one of the four best inspection departments in the Union, is seriously considering fundamental changes in the interest of still greater efficiency and economy. Illinois, with re-awakening interest, has problems of interpretation growing out of her new labor code. New Jersey, still shuddering over the Newark factory fire, is eager to make radical changes. Missouri, rapidly developing industrially, finds she is the only one of the thirty-six states having factory inspection laws which limit supervision to cities above a certain size (10,000), and except Colorado, Missouri is the only state which relies for the support of its department upon fees paid by employers. Pennsylvania and Michigan show encouraging signs of discontent, and a conviction is spreading everywhere that the administration of the law is the supreme test.

STATE BRANCHES

The New York branch of the Association for Labor Legislation held its annual meeting and banquet November 10. The Illinois branch met in Chicago November 26 and the Minnesota branch, in Minneapolis, December 8. These local organizations reported gratifying advances during the year, re-elected officers, and adopted definite plans for vigorous campaigns in support of the legislative program of the national association.

PHOSPHORUS PROHIBITION

"What about that girl working in that match factory?" asked C. Croydon Marks of the House of Commons, while speaking recently before an audience of business and professional men at the Chicago City Club. "She works in a match factory and takes the risk. Matches cannot be made with poisonous phosphorus without that risk." "Cannot you make matches without phosphorus? Yes, but it costs a little more. Well, we have settled that problem in England." England, in common with the leading industrial countries of the world, has prohibited the use of poisonous phosphorus in her match industry. The United States, at the present session of Congress, will have an opportunity to give similar protection to her work-people. A bill to place an internal revenue tax upon matches made with the poison is now before the committee on ways and means.

MISSOURI COMMISSION

A State Commission on Employers' Liability, recently appointed by Governor Hadley of Missouri, held its first session December 2. It is composed of twenty-eight members, who include the attorney general, the superintendent of insurance, the labor commissioner, and one woman—Sadie Spraggon of Kansas City.

STATE MUSEUMS OF SAFETY

One of the most popular exhibits at the recent Minnesota State Fair was a collection of devices for the prevention of industrial accidents and diseases. Dangerous machines, each with its own appropriate guard, excited the keen interest of employers. Workmen said: "We will tell our boss about these things." State Labor Commissioner McEwen appreciates the suggestive value of permanent exhibits similar to the safety museums founded by the German government, and through his immediate efforts the Minnesota museum has been permanently installed at the capitol.

A travelling exhibit will be sent over the state to illustrate lectures on accident prevention. Wisconsin has made a similar beginning in a modest way, and the coming year will no doubt see many more such exhibits properly founded by various states.

SPECIAL SESSIONS

Since August 1 special sessions of state legislatures have been convened in Colorado, Texas, Oklahoma and Louisiana. Vermont's regular session opened October 10.

INTERNATIONAL LEGISLATION

Full reports of the sixth international congress of the Association for Labor Legislation, which met in September at Lugano, Switzerland, will soon be printed. Twenty countries were represented by 112 delegates, six from the United States. Reports were received from several scientific commissions, and after days of careful discussion resolutions were adopted with reference to the night work and ten-hour maximum day of women and young persons, the prohibition of poisonous phosphorus in the production of matches, the enforcement of labor laws, the regulation of shifts in continuous processes and hours of work in dangerous trades, the establishment of wages boards for home workers, the study and elimination of industrial poisons, principles for the regulation of work in compressed air, the prevention of accidents, and the encouragement of just plans for workmen's insurance. The next international congress will meet in the autumn of 1912 in Zurich.

BOOKS FOR SOCIAL WORKERS

LILIAN BRANDT, Contributing Editor

WORKINGMEN'S INSURANCE IN EUROPE. By Lee K. Frankel and Miles M. Dawson, with the co-operation of Louis I. Dublin. Russell Sage Foundation publication. New York. 1910. Pp. 440. Price $2.50, by mail of THE SURVEY $2.70.

This is the most important contribution that has yet been made to the literature available in English on the subject of workingmen's insurance in Europe.

In four parts the authors give the essential facts in regard to insurance against industrial accidents, sickness and death, invalidity and old age, and unemployment, in Great Britain, Norway, Sweden, Denmark, Holland, Belgium, France, Switzerland, Italy, Germany, and Austria. Accompanying the descriptive material is a running commentary which serves to interpret and explain what would otherwise be both technical and uninteresting to the average reader. A final section emphasizes the tendency in all these countries for complete insurance systems to be worked out. This is forcibly illustrated by the reform proposals now under consideration in Germany and Austria, which are fully explained.

As a whole the book is both a supplement and a corrective to two other important books that have recently appeared in this field: Frank W. Lewis's State Insurance[1] and Charles R. Henderson's Industrial Insurance in the United States[2]. It supplements them by supplying the facts in regard to European experience, and it corrects some of the conclusions of these writers by showing that this experience disproves some of their assumptions as to the tendencies of certain forms of social insurance.

[1] State Insurance. By Frank W. Lewis. Houghton Mifflin Company. Boston. 1909. Pp. 233. Price, $1.25; by mail of THE SURVEY, $1.36.

[2] Industrial Insurance in the United States. By Charles R. Henderson. University of Chicago Press. 1909. Pp. 448. Price $2; by mail of THE SURVEY, $2.19.

WAGE EARNING WOMEN. By Annie Marion MacLean. The Macmillan Company. New York. 1910. Pp. 202. Price $1.25; by mail of THE SURVEY $1.35.

A pleasantly-written description of groups of working women in a number of different places is the outcome of the ambitious "investigation" conducted by the sociological investigation committee of the National Board of the Young Women's Christian Association. But if this was the goal, why an "investigation", involving altogether a staff of forty, including twenty-nine field investigators with a variety of academic degrees, and field work amounting in all to "the equivalent of four full years' time of one worker"? A few weeks' observation by some one already possessed of a background would have done quite as well, and would have avoided the necessity for hampering the narrative with "statistics", which it is difficult to take seriously, both because of the schedules which were used in collecting them (given in full in an appendix) and because they seem to be sprinkled in from a sense of duty, not from any feeling on the part of the author that they have an organic relation to the matter in hand. Why, once more, did not the association utilize its resources by collecting information from the thousands of girls with whom it must, through its employment bureaus, clubs, and other activities, already have had relations? The chapter on Uplifting Forces seems to us curiously out of drawing and the Suggestions for Improvement vaguely inadequate.

As an indication, however, of growing interest in the welfare of working women and girls, and of the earnest purposes of the Y. W. C. A. to promote it, it is entitled to respect and commendation and to the hope that it will reach many readers who will be able to "skip" the statistics and, reading around them, to get hold of the sincere de-

sire that is behind the book, the desire "that the young girl in the shop and at the machine may have life and have it more abundantly."

WHERE SHALL SHE LIVE? By Mary Higgs and Edward E. Hayward. P. S. King and Son. London. 1910. Pp. 213. By mail of THE SURVEY, 40 cents in paper, 55 cents in cloth. Four weeks required to import.

Collaboration was resorted to in this book because it was considered "eminently desirable that the national need should be viewed not only from the emotional standpoint of a woman, but in the cold light of statistics." In order not to mix the two presumably antipodal points of view, Mr. Hayward first presents his "mass of available facts," while the "dangers and difficulties arising from this state of things" and the practical suggestions are left to Mrs. Higgs—the "lady tramp", as she is sometimes called, in allusion to her personal investigation of the casual wards. She, too, tries to write "calmly, almost coldly," until within eight pages of the end, where she breaks the restraint to plead for "a great League of Womanhood to Protect Womanhood."

Some consideration is given to the housing conditions of home workers, and of factory workers (who generally, as in America, live in their own homes), but the problems which take up the bulk of the book are those of clerks and "shop assistants" living away from home. The discussion of the "living-in system" for shop assistants, which is general in London and the larger provincial towns, is of special interest. The shortcomings of existing accommodations, whether purely commercial or partly philanthropic, are made quite clear, but no adequate program is set forth. A list of safe lodging-houses in the principal cities occupies but five pages in the appendix.

The book was prepared for the National Association for Women's Lodging Houses, formed in 1909.

A HISTORY OF CALIFORNIA LABOR LEGISLATION. University of California Publications in Economics, Vol. II. By Lucile Eaves. The University Press. Berkeley. 1910. Pp. 461. Price $4; by mail of THE SURVEY $4.26.

The plan inaugurated by the Carnegie Institution, to have the essentials of labor legislation in each state presented in separate monographs, which taken together would give the basis for an economic history of the labor movement in America, has already borne fruit in notable publications valuable for comparative study. The latest is this volume about California.

An introductory chapter on the San Francisco Labor Movement traces the history of trade unionism in San Francisco from 1850 to date and shows the peculiarities of race conflict, economic and social environment, and politics in a new and richly endowed state that have given rise to a peculiar class struggle. Chinese exclusion necesssarily receives much attention, in four chapters covering one-fifth of the entire monograph.[1] Hours of labor, payment of wages, employers' liability, woman and child labor, health and safety, Sunday laws, employment agencies, convict labor, labor bureaus, arbitration, union label, and judicial restraint of trade unions, are topics to each of which a chapter is devoted.

In summing up results Dr. Eaves properly regards the anti-Chinese and the anti-convict labor legislation as the most characteristic and successful achievements of organized efforts to protect a high standard of living among wage-earners. Californians have generally recognized the right of laborers to organize, and the ensuing legislative activities are regarded as experiments in democracy rather than revolutionary assertions of class supremacy.

THE CHILD LABOR POLICY OF NEW JERSEY. By Arthur Sargent Field, Ph. D. American Economic Association. Cambridge, Mass. October, 1910. Pp. 229. Price $1.25; by mail of THE SURVEY $1.35.

This monograph belongs in the series of studies in labor legislation to which reference has just been made. It appears to have been carefully done, but it is safe to say that it would have been more useful even to the specialist in child labor legislation, and certainly to the general student of social problems, if it had been put into fifty or seventy-five pages, instead of over two hundred. Unfortunately it stops short of the important—in a sense culminating—events of 1910.

It may be questioned whether their part in the evolution of a "state policy" is the most significant aspect of the facts which make up such a history as this. In the case of New Jersey, at any rate, it would seem to be less important to trace the development of such state policy as had been achieved up to the end of the year 1909, than to place on record a clear account of the dramatic struggle which has been waged between the protectors of children and the glass and mercantile interests, to secure the prohibition of night-work by children under sixteen and to bring mercantile employments under the general child-labor law.

BISHOP POTTER: THE PEOPLE'S FRIEND. By Harriette A. Keyser. Thomas Whittaker. New York. 1910. Pp. 196. Price, $1; by mail of THE SURVEY, $1.06.

Bishop Potter as "The People's Friend" is here portrayed by Miss Keyser, who was secretary of the Church Association for the Advancement of the Interests of Labor during the years when he was its president. Some of the most interesting details of the picture are the extracts from sermons preached in 1878

[1] In this connection we would call to the attention of our readers the pro-Chinese discussion of Chinese Immigration in the volume by Mary Roberts Coolidge, published last year by Henry Holt and Company, New York. Pp. 531. Price $1.75; by mail of THE SURVEY, $1.88.

and 1879, long before the day of Tuberculosis Sundays and Budget Sundays, on such topics as The Slaughter of the Innocents (from epidemic diseases and tenement house work), The Homes of the Poor, The Social Indifferentist

National Perils and Hopes. By Milton F. Crafts. F. M. Barton Company. Cleveland, Ohio. 1910. Pp. 152. Price 50 cents; by mail of The Survey 56 cents.

The superintendent of the International Reform Bureau herewith adds "a study based on current statistics and the observations of a cheerful reformer" to the thirty-four books he has previously published. After a "general survey of present moral conditions in the nation and in the world" he justifies his self-assumed epithet by the conclusion: "There is enough light—though it is only morning twilight yet—to cheer the most despondent."

Euthenics. By Ellen H. Richards. Whitcomb and Barrows. Boston. 1910. Pp. 162. Price $1; by mail of The Survey $1.07.

Euthenics is described as "the science of controllable environment" and pre-requisite to eugenics. Mrs. Richards evidently has an audience of women in mind—mothers and housekeepers and members of clubs—whom she wishes to rouse to a realization of the importance of favorable living conditions and of their own power to improve existing conditions.

The Coming Religion. By Charles F. Dole. Small, Maynard and Company. Boston. 1910. Pp. 200. Price $1; by mail of The Survey $1.08

In this book the individual's social consciousness is treated both as a primary source of religion and as being itself the essence of religion. "Man has a bias to belong to something, to some order, fellowship or brotherhood larger than himself. This instinct is the stuff of which religion is born." The expression of this instinct in family, friendly, neighborly, civic and social relations is declared by Mr. Dole to be the "one mighty structure of religion, within and behind which a real and living presence reveals itself," and this deeper religion he finds "behind and under all religions, in all of us, common to man."

For this fundamental religion behind the creeds, a "new necessity" is discerned in the immense pressure of a democratic need. In mediating this democratic gospel, a new necessity is found for the church. It plays the part of "a university for old and young in relating each one's shifting experiences and showing how to relate them together and to turn them into significance." And this social cult of religion must more and more issue in the church's social activity and result in social righteousness.

As in his Ethics of Progress, in which he rooted ethics in religion, so in The Coming Religion, in which he roots religion in ethics, "good-will" is the mightiest of all forces, in which religion and ethics are one.

COMMUNICATIONS

THE SAFETY MATCH

To the Editor:—

I have read Mr. Heaton's article, Making All Matches "Safeties." Matches are made in heaven and are all deucedly unsafe. I don't see what we can do about it, but I'm glad to see you trying.

E. H. W.

Columbia University.

SAVING THE BABIES

To the Editor:

In my report of the first annual meeting of the American Association for Study and Prevention of Infant Mortality, (The Survey, November 26), I quoted Dr. Cressy L. Wilbur, chief statistician of the Bureau of the Census, as saying that "the system of registration in Baltimore was probably the worst in the civilized world—with those of Chicago, St. Louis, New Orleans and most other American cities as close seconds in the unenviable competition."

Dr. Wilbur informs me that this is unjust to St Louis, "because," he writes, "Dr. H. Wheeler Bond, commissioner of health, has taken an active interest in the improvement of birth registration in St. Louis during recent years, and it is far better than the birth registration in the other cities mentioned. Also, St. Louis, together with all other cities of Missouri, is now under the operation of the new state law for the registration of births and deaths, which is being administered most efficiently by the state registrar, Dr. Frank B. Hiller, secretary of the State Board of Health. I regard St. Louis and Missouri generally as very promising for thorough enforcement of birth registration laws."

I take special pleasure in making this correction, because Missouri is my native state.

Robert W. Bruère.

New York.

DR. PARK ON TUBERCLE BACILLI

To the Editor:

In the *New York Medical Journal* for July, Dr. E. C. Schroeder criticises severely certain paragraphs in the account of the annual meeting of the National Association for the Study and Prevention of Tuberculosis, which appeared in The Survey of May 14, as well

as a bulletin for the press containing an abstract of one of the papers presented to the pathological section of the association and issued in advance of the meeting. The criticism refers to the reports of Dr. William H. Park's paper on Types of Tubercle Bacilli as Found in Human Tuberculosis and Their Relative Importance, and charges that not only were statements of fact contained in the paper misrepresented, but that conclusions were attributed to the speaker which he had not drawn and which he did not hold.

As both the bulletin and the article in THE SURVEY emanated from the executive office of the National Association, and as they unquestionably contained errors, I beg the privilege of your columns to make certain corrections.

In the report of the meeting as it appeared in THE SURVEY it was stated that "Dr. Park demonstrated from a careful study of over 400 cases of tuberculosis of all types chosen at random, that only two and one-half per cent of all tuberculosis in New York city comes from infected milk, butter or meat—that is, from bovine sources", etc. There follows a brief statement of cases described by the author, and it is again repeated that "in a total of 436 persons of all ages examined, only two and one-half per cent owed their infection to bovine products."

Dr. Schroeder examines the data presented and shows that they would indicate not two and one-half per cent, but more than seven per cent. This point, so far as the exact wording of the report is concerned, is well taken, the explanation of the discrepancy being that there was an inexact reproduction of a sentence in the advance abstract furnished by the author to the National Association, in which it was stated that it was "estimated" that about two and one-half per cent of all tuberculosis in New York city is due to the bovine type of bacilli. Without working over the data, it was assumed that the figure in question was based upon the cases reported, although it is evident that other data contributed to the estimate mentioned.

With regard to the advance abstract in a bulletin furnished to the newspaper press in advance of the meeting, Dr. Schroeder criticises sharply and with justice certain statements as well as the tone of the bulletin. The bulletin in question stated, in addition to the inaccuracy mentioned above, that it was pointed out "that the significance of these conclusions will be to direct all the energy of the campaign against tuberculosis to combating the spread of this disease among human beings, by preventing spitting, bad housing, overwork, and other conditions bad for the health." It should be stated frankly that Dr. Park did not draw these conclusions, but confined himself entirely to a scientific discussion of the facts which he presented and with which alone he was dealing. He did not concern himself with inferences as to the practical bearing of his studies.

It is perfectly obvious that such a phrase as "direct all the energy of the campaign" is unjustifiable, since a percentage of tuberculosis, whether two and one-half, seven or greater, is of sufficient importance to call for attention and determined action. In other words, it should be admitted frankly that the attribution of inferences to Dr. Park, as well as the somewhat polemic tone of the abstract, was out of place. In explanation it should be said that the newspaper abstract was prepared in a routine way by the publicity bureau of the National Association, and owing to exceptional circumstances existing in the office at the time was issued without being properly censored. It was simply a misplaced exercise of newspaper instinct for publicity and contained no ulterior motive whatever. Since public protest has been made it seems fitting that a public correction should be offered.

LIVINGSTON FARRAND,
Executive secretary, National Association for the Study and Prevention of Tuberculosis.

New York.

PHYSICAL CULTURE IN SCHOOLS

TO THE EDITOR:

I was prevented from attending the hearing appointed by the Board of Education to consider the abrogation or perpetuation of a number of subjects hitherto carried on the curricula of our schools, amongst others that of physical culture, also that of a foreign (mainly the German) language. In both, thousands of thoughtful people are greatly interested. I am convinced that there are but few who have not thoroughly studied and weighed the reasons pro and con. In regard to both I sincerely regret that the city government should feel tempted to think of refusing the appropriation usually granted for them. It is true I am not in a position to know how any saving of money could be accomplished or to what extent a transfer of funds would benefit the very subjects above mentioned. In New York city, however, we suffer from many causes of ill health or invalidism amongst the school children, mainly congestion and an improper or insufficient food supply. In my opinion a rational and careful introduction of physical culture in the several curricula is more than merely advisable, it is necessary to improve physical well-being.

A. JACOBI, M. D.

New York.

JOTTINGS

Hospital Association Secretary.—Frederick Davis Greene, for five years assistant general agent of the New York Association for Improving the Condition of the Poor, has recently been chosen general agent of the New York Hospital Saturday and Sun-

day Association. He succeeds Frederick F. Cook, who has been made honorary secretary after an active service of twenty-eight years. The association collects about $90,000 a year from organizations and individuals, chiefly on the last Sunday in the year and the preceding Saturday. This is disbursed among forty-five hospitals through a committee of which the mayor is chairman.

Mr. Greene, the son of American missionaries, was born in 1863 near Constantinople. He was graduated from Amherst in 1885 and from the Yale Divinity School in 1888, following which he engaged in educational work in Turkey. He was secretary of the New York Chamber of Commerce committee on Armenian relief which raised $263,000 in 1895-7 and helped raise the $250,000 fund for famine sufferers in India in 1900. Following six years as financial agent for the American Bible Society and a course in the New York School of Philanthropy, he joined the staff of the Association for Improving the Condition of the Poor.

Moral Prophylaxis Meeting.—A stated meeting of the American Society of Sanitary and Moral Prophylaxis will be held at the New York Academy of Medicine the evening of December 22. Papers will be presented by Prof. E. R. A. Seligman of Columbia and Prof. Felix Adler on the Sanitary Supervision of Prostitution. The Control of Venereal Diseases by the Health Department will be presented by Dr. Abraham Jacobi, Dr. Stephen Smith, Dr. Thomas Darlington, and Dr. Eugene H. Porter, state commissioner of health, followed by a general discussion. The public is invited.

Billboards Before Supreme Court.—Those who have been following the crusade against the billboard may remember that some months ago one of the divisions of the Missouri Supreme Court rendered a decision upholding the right of the city of St. Louis to regulate by ordinance the size and location of billboards within the city limits. This decision came after a four years' fight and attracted national attention. The trial court below had held that the municipality had no power to pass such a regulating ordinance and the Supreme Court decision overruled this.

But the Supreme Court decision was not without dissent. As it was the finding of only one division of the court, the case, as permitted by Missouri law, was certified to the Supreme Court *en banc*, the two divisions sitting in a body. On October 25, the case was re-argued and submitted to the whole court. The trial was largely attended and attorneys from St. Louis, Kansas City, and Chicago argued on behalf of a billboard company, and the city counsellor of St. Louis on the right and power of the municipality to regulate it as a nuisance. If the decision of Division No. 1 is sustained it will mean that Missouri cities have the power to regulate and therefore wholly to suppress billboards within their limits. A decision is expected within the next three or four months, and in the meantime the billboards flourish in unmolested luxuriance.

Donnell in St. Louis *Globe-Democrat.*

PUZZLE PICTURE.
Find the City Beautiful.

Secretary for Brooklyn Federation.—After a year of effective volunteer work by a number of prominent Jewish business men of Brooklyn in forming a Federation of Jewish Charities, the executive committee has engaged Philip L. Seaman of St. Louis as executive secretary. The objects of the federation are to systematize the work of Jewish charities, to guarantee an income to the best known institutions and to do away with the expensive system of raising money by entertainments. Cash collections for 1910 have been $87,000 and before the end of the year it is expected that they will be nearly $100,000. The maximum amount collected in any year under the old system was about $70,000. During the past year no tickets have been sold for entertainments and no subscriptions solicited except by pledges of annual amounts.

Mr. Seaman has been the general superintendent of the Jewish Educational Charities Alliance of St. Louis. The plan of pensioning mothers, recently inaugurated in New York and in some German cities, was instituted by him in St. Louis. He was also connected with the Legal Aid Society, the Civic League, the Housing and Sanitary Committee, the Society for the Prevention and Relief of Tuberculosis, the St. Louis Pure Milk Commission, the Association for the Prevention of Blindness, and the School of Social Economy. He was born in Warsaw, Russia, coming to this country when twelve years old. He received his

education in Brooklyn and studied law at Washington University. The executive work of the Brooklyn Federation of Jewish Charities has been shouldered during the past year by an executive committee, with Nathan S. Jonas as its president.

Child Welfare Exhibit—A series of conferences has been announced as a part of the New York Child Welfare Exhibit in the Seventy-first Regiment Armory January 18 to February 12. Afternoon and evening sessions of two or three days will be given to each of the following subjects: education, religion, homes, recreation, health, work and wages, the law and the child, private philanthropy. At the end of the conferences a day will be devoted to discussing resolutions and suggestions resulting from each of the sessions. It is hoped that the resolutions will at least outline a suggestive program of action for the whole field of child welfare. The conferences will endeavor to translate the data and exhibits into definite action or suggestions for definite action by citizens and the municipality. The last day will be devoted to the proposed federal children's bureau, as it is expected that the other conferences will furnish material showing the need for it. There will also be choruses of school children, orchestras, gymnastic drills, folk dances, moving picture shows, two pageants, and athletic performances by the Boy Scouts and the Y. M. C. A. boys.

Second Year of Buffalo Seminar.—The Buffalo Seminar has announced its program for 1910-11 on The Social Posibilities of Our City Government: What it is Doing and Might Do. The "doing" and "might do" are divided into seven parts, each under a group leader, as follows: public health, Frederic Almy; public recreation, Thomas F. Cooke; public employment, George H. Chisholm; public intelligence, John Lord O'Brian; public morals, the Rev. William H. Boocock; the Buffalo that might be, Francis Almy; a new city charter, Melvin P. Porter.

The purpose of the seminar this second winter, is "to make a sympathetic study of what the city government is doing for the social welfare of Buffalo, and to stimulate interest in the development of its efficiency in this direction."

Readers of THE SURVEY will recall Mr. Boynton's very interesting report (issue for August 6), of the first year of the seminar, which he described as "a social study of Buffalo, its conditions and needs, by means of an informal union of four churches." The average attendance was over ninety.

Merge Boston City Departments.—For several months past John Rourke, superintendent of streets of Boston, has been endeavoring to consolidate the street, water and engineering departments of the city under one administrative head. Mayor Fitzgerald appointed Mr. Rourke commissioner of streets while the latter was still at the head of the construction work on the Panama canal. In Panama Mr. Rourke saw that increased efficiency resulted from the organization of the canal work under one head and when he came to Boston he immediately urged a consolidation of the three city departments mentioned. There has been considerable opposition to his plan, but on November 14, by a vote of five to three in the City Council, an ordinance was adopted carrying it out and placing one man over the three departments. The present superintendent of streets will act as head of the board. A board of public works, similar to the Boston board, has not been adopted in any of the other larger American cities, where nevertheless a great deal of effort and efficiency is wasted owing to the overlapping of the various engineering departments. As things have been in Boston the Street Department and the Water Department have been continually at odds, and paving work has often been held up at considerable expense and inconvenience to the city. With the new concentration of authority increased harmony and simplicity in municipal engineering machinery are expected to result.

Prevention of Insanity.—The New York State Charities Aid Association's new committee on mental hygiene will hold its first meeting the evening of December 23 at the Academy of Medicine under the latter body's section on public health. The program is especially for those interested in the social and scientific aspect of the committee's campaign for the prevention of insanity, but the meeting is public.

Dr. Albert Warren Ferris, president of the State Commission in Lunacy, will discuss the extent, causes and increase of insanity and the plans of the commission to bring state hospitals in closer relations with the people. Dr. M. Allen Starr of the College of Physicians and Surgeons will speak on the extent of our present knowledge of the causes and forms of insanity. Homer Folks will describe the plan of campaign to be conducted by the State Charities Aid Association to secure treatment of insanity through clinics and dispensaries, and to spread knowledge of its causes. Samuel McCune Lindsay will speak on the new forms of education which have brought success to the tuberculosis campaign, the propaganda against congestion of population, and the campaign for the prevention of blindness.

Training for Civil Service.—Beginning January 1 the department of sociology of the University of Missouri will supervise a course of training to be offered in Kansas City for those desiring to take Civil Service examinations for municipal positions in social work. Three courses are now planned, covering probation work, relief work and tenement house inspection.

THE COMMON WELFARE

CHRISTMAS EVE ON BEACON HILL

Beacon Hill! The very name carries Boston with it and pictures fine old homes with handsome doorways and brass knockers and purple window glass with glimpses of mahogany beyond. Part and parcel of conservative Boston is Beacon Hill, a little neighborhood which still holds to some of the traditions of a century back and is rightfully proud of its name.

Now if you should happen to be a late shopper on Christmas Eve—though of course as a reader of THE SURVEY you have shopped early—and should be crunching across the snowy Common with your arms full of bundles and your ears just about frozen off, you might perhaps stop in astonishment if you happened to glance toward the "Hill", for you would see glimmering candle lights in almost every window and there in front of an ex-governor's home you would notice a group of half a hundred men and boys. A strange time for the governor to be making a speech, you think, and you see that gentleman step out into his doorway and, instead of a political address, you hear the voices of the men and boys floating over the frosty Common. They are singing a Christmas carol, and you take a fresh grip on your slippery bundles and climb the hill in time to hear the singers shout "Merry Christmas" to the governor.

All along Beacon street the windows are aglow with candles. The little company, headed by a boy holding aloft a cross, moves to the next house, stops and sings another Christmas carol. Down a cross street you crunch through the snow to the candle-lighted home of a "shut-in", where the singers again call "Merry Christmas," and answer a hand wave with a verse from Saint Martin's hymn.

"Oh, we sing all over the Hill until midnight," said the boy with the cross. You remember that your bundles must be put into waiting stockings long before then, and hurry along for your car and forget all about the bad temper which you picked up an hour before in the crowded store.

Fifty years ago the rector of the Church of the Advent inaugurated the "Choir Christmas Eve," which has been revived since 1907 and adopted as a regular custom by Beacon Hill neighbors. An old tradition that the way of the Christ Child should be lighted with candles on Christmas Eve accounts for the wavering lights that fill the windows. To the homes where candles burn the singers go, regardless of religious denomination or belief, echo a "Merry Christmas" and sing a carol. Those of the parish who are shut in are sure of a visit, and the singers are

Sykes in Nashville Banner.

"OUR HOPES TRIUMPHANT O'ER OUR FEARS."

always as certain of a welcome as they were back in 1859, when the late Bishop Huntington was serenaded by the Christmas Eve singers. He tells the story in his Memoirs and Letters:

> After the house had become still, about ten-thirty, as I was sitting in the study preparing for the holy duties of the day, suddenly most delightful music in youthful voices burst under my window. I raised the curtain and there stood a picturesque group of singers, mostly young boys, with lanterns, under the sparkling sky in the frosty night, pouring out Christmas anthems—genuine old English carols, in music and words wholly picturesque.

"Christmas celebrations are changing," said Dr. William H. Van Allen, the rector of the Church of the Advent, "and this 'Choir Christmas Eve' marks a distinct return to the religious celebration of the day. There is a good Christmas feeling wherever we go and a proper kind of sectional spirit is being developed."

Is Beacon Hill indeed conservative? What would some of the good old Puritan stock of a hundred years back think of the Merry Christmas Eve celebration of 1910?

THE ROCKEFELLER FOUNDATION CHARTER

Senator Gallinger has introduced a series of fifteen amendments to the bill which would bestow a federal charter upon the Rockefeller Foundation. This bill, introduced last March, was discussed in its fundamental aspects by the editor of THE SURVEY at that time.[1] The general understanding has been that the proposed foundation is to receive such financial resources from the elder Rockefeller as will surpass all other philanthropic endowments, its broad commission being couched in the following terms:

> To promote the well-being and advance the civilization of the peoples of the United States and its territories and possessions and of foreign lands in the acquisition and dissemination of knowledge; in the prevention of suffering; and in the promotion of any and all the elements of human progress.

As originally introduced the act provided for a corporate body consisting of John D. Rockefeller, John D. Rockefeller, Jr., Frederick T. Gates, Starr J. Murphy, Charles O. Heydt and such persons as they might associate with them, clothed with the power of perpetual succession.

When the charter was made public last spring, THE SURVEY noted editorially that "in the presence of such record breaking philanthropy . . . . the language of appreciation confesses bankruptcy." Three years earlier, having in mind such comparatively modest institutions as the Russell Sage Foundation, the General Education Board, and the Carnegie Foundation for the Advancemen of Teaching, the editor had pointed out that the brutal power of concentrated wealth, even when embodied in a philanthropic foundation, might not always work on the side of the public welfare. In view of the limitations to which this and all other endowments are thus subject, the editor suggested for consideration three additional provisions which, for purposes of comparison, may be reprinted here:

> That the government should have a voice in the selection of incorporators and trustees.
>
> That it should be stipulated that the annual

[1] See Social Forces in THE SURVEY for March 12 and March 26, 1910.

income during the life of the endowment should actually be expended for the purposes enumerated in the charter, the indefinite increase of the endowments through compound interest being forbidden.

That within a specified period, which might properly be one hundred years or more, any given endowment should be entirely expended, both principal and interest.

The amendments offered by Senator Gallinger modify the original bill with respect to membership, scope and financial stewardship. With respect to membership they provide that:

The successors to the incorporators named herein and the additional members of the corporation and their successors shall be elected by the members of the corporation for the time being, but before such election shall become effective, written notice thereof shall be mailed by said corporation to each of the following named persons at his official post office address, viz.: the president of the United States; the chief justice of the Supreme Court; the president of the senate; the speaker of the House of Representatives; and the presidents of the following institutions, viz.: Harvard University, Yale University, Columbia University, Johns Hopkins University, and the University of Chicago. If such election shall be disapproved by a majority of the persons above named it shall be void; but it shall become effective if and when it shall be approved by such majority, or at the expiration of sixty days from the mailing of such notices if it shall not have been disapproved by such majority.

CONGRESS MAY IMPOSE TERMS

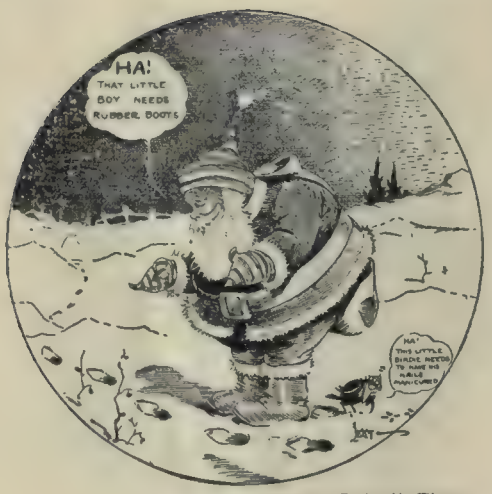
With respect to scope, the following is inserted after the word "progress," in the section of the proposed act stating the objects of the foundation as cited above:

provided, however, that the Congress of the United States may at any time impose such limitations upon the objects of the said corporation as it may deem the public interest demands, and any and all gifts, devises, bequests or property at any time received or held by said corporation shall be received and held subject to the terms of this proviso, and to the terms and limitations which may be imposed by any act of Congress hereafter passed with reference thereto.

With respect to the property holdings and disposal of income and principal of the foundation, these provisions would be added:

that the total amount of property held at any one time, including that which is held absolutely as well as that which is held in trust, shall not exceed the value of one hundred million dollars, exclusive of increases in the value of property subsequent to its receipt by said corporation.

The income of the property of the said corporation shall not be accumulated or added to the principal, but shall be currently applied to the purposes for which the corporation is created, subject only to such reasonable delay as may be necessary in the wise administration of the fund.



At any time after the expiration of fifty years from the receipt by the said corporation of any property, whether by deed, grant, devise or bequest, the said corporation may distribute the principal, or any part thereof, as well as the income thereof, provided such action shall be authorized by a resolution passed by the affirmative vote of two-thirds of all those who shall at the time be members of the corporation, at a special meeting held on not less than thirty days' notice, given in writing, which shall state that the meeting is called for the purpose of considering a resolution to authorize the distribution of the whole or some part of the principal of said funds; and after the expiration of one hundred years from the date of its receipt by said corporation the said corporation shall distribute the principal, if so directed to do by the Congress of the United States; and all gifts, grants, devises or bequests to the corporation shall be taken and held subject to the provisions of this section.

A LARGE OPPORTUNITY.

The section providing "that all personal property and funds of the corporation . . . shall be exempted from

Leet in Detroit Times.

THE REAL BOY SCOUT.

taxation" is amended by the words "by the United States or any territory or district thereof."

The New York *Times*, which took issue with the criticisms made of the foundation by the editor of THE SURVEY last spring, would seem to hold, in an editorial published the past week, that THE SURVEY's suggestions have been met by these amendments. THE SURVEY must reserve to its own columns at some future date any expression of its editorial judgment as to whether or not they meet the positions which it has taken "not in alarm nor in disparagement, but in sober consideration of the great responsibilities to be entrusted by the government and by the founder to the incorporators and trustees of the foundation."

PREVENTION OF ALIEN CRIME

A step which opens up for discussion the whole subject of alien criminality in New York and may lead to valuable investigation into it, was taken December 14 at a conference called jointly by the City Club and the Italian-American Civic League. Resolutions were adopted calling for the appointment of a committee of five to confer with the immigration commissioner, the police commissioner, the United States district attorney, the district attorneys of the counties embraced in the city, and other officials, concerning the exclusion of alien criminals, the deportation of those already here, and the prevention of crime among alien residents of the city. The committee was appointed by Charles H. Strong, president of the City Club, and consists of Howard Gans, former assistant district attorney; C. Blake Orcutt of the Italian-American Civic League, the Rev. Melville Knox Bailey of Grace Church Chapel, J. G. Giambalvo, a lawyer residing in Brooklyn and a Sicilian, and Arthur H. Warner.

The meeting was called to "consider specifically what can be done to free New York city from a large number of Italian criminals and to prevent the immigration of Italian criminals in the future." So strong was the opposition expressed at the conference by prominent Italian residents, to singling out their fellow countrymen as a foreign class disproportionately criminal, that the resolutions, as finally adopted, were made to refer to alien criminals in general rather than to Italian criminals only.

As a basis in fact on which to rest its movement, the promoters of the conference call attention to the statistics showing recent increases in crime among Italians in New York. It was stated that out of 700 Italian immigrants concerning whom certificates of criminality have been obtained from the Italian government, only forty-seven have been deported. To aid in further deportation, it is suggested that the time of residence in this country which shall be a legal bar to deportation be extended from three to five years. This was recommended by the Federal Immigration Commission, but has been held by many to be insufficient. The New York *Times* has pointed out that it merely puts a premium on the shrewdness which postpones detection until the sixth year. A better way, as was suggested at the conference, is the English practice, by which an alien who commits a crime may be deported no matter what his length of residence.

Significant also, because reflecting an attitude that can always be relied upon to make itself felt, were the expressions that came from prominent New York

Italians who had been asked to attend the conference. Several of them insisted that excessive Italian criminality in this city is largely a fiction of sensational journalism. The Italian criminals from whom the community does suffer are, they contended, not newcomers to the country, but persons of from ten to twenty years' residence here, who have learned something of our civilization. Such newcomers as do display criminal tendencies become simply the quiet instruments of their shrewd Americanized predecessors. From this it is argued that the remedy for so-called Italian crime is not restriction of immigration, but deportation. Great numbers of present-day Italian immigrants, it was urged, find the doors of too many American manufactories closed to them. They must support themselves and their families, nevertheless, and so they are driven to reliance upon fellow-countrymen who have preceded them to America. This reliance is exploited by a few criminals, and the new immigrant, innocent and reliable when he landed, becomes a pawn in the fingers of the astute crook.

The comparatively small number of Italian detectives in New York was another cause to which was attributed the preponderance, if there be any, of Italian criminality. The remedies suggested by the Italians themselves were adequate work for the immigrant, the enforcement of laws, the creation of an efficient police force, and education.

The Italian members of the Italian-American Civic League, who were the initial promoters of the conference, insist that they have entered the movement in a spirit of national pride. They hope to enlist the interest of the half million or more Italian residents of New York in the suppression of such crime as exists among them. Through the influence of Italians themselves, they believe, the best effects can be produced.

PREVENTABLE DISEASES ARE NOT NOW PREVENTED

That "diseases known to be preventable are not now prevented" was the keynote of a stirring call to arms which Dr. Eugene H. Porter, New York state commissioner of health, sounded at the annual meeting of the Association of Insurance Presidents. He made a well-argued plea for the insurance companies to lead in a great crusade for health:

Winner in Pittsburgh Post.

IS THERE A SANTA CLAUS?

The old days and the old conceptions of disease are passing away. The old way has cost more lives than all the wars since Alexander and more gold than has ever been mined. We have learned that if we allow our neighbor to wallow in filth we must expect to suffer some of the consequences. Blocking our way stand the troops of selfishness and ignorance, the twin foes of progress. Far behind this great movement of ours there is a distinct moral question. "Thou shalt not steal"—thy neighbor's health and the Golden Rule lie at the foundation. The rights of one man in health matters necessarily limit those of another. Freedom must be safeguarded by law, and "the limitation of freedom is fair play."

It is evident that the weakest spots in the enemy's line are the mortality rates of tuberculosis, typhoid fever, scarlet fever, measles, and diphtheria. There are three strongly entrenched positions that must be moved upon and overthrown—pneumonia, Bright's disease, and cancer. In a somewhat isolated position stands the fort—deaths by violence. We must storm it.

Now let us face the fact that diseases known as preventable are not now prevented and are not likely to be prevented entirely for many years to come. We have begun a vigorous campaign against tuberculosis and the results are beginning to show. An effective campaign against typhoid fever would show quicker and more marked results.

But if the prevention of disease is to be the crowning glory of our civilization a campaign of education must be undertaken. The knowledge now possessed by our trained sanitarians and expert laboratory workers must be carried to every home and read at every fireside.

Carter in New York American.

WHAT CAN THE POOR DOVE DO?

Andrew Carnegie's gift of ten million dollars for a Peace Foundation has set the cartoonists at work on a new theme.

No reasonable argument or law could be advanced against a health campaign by life insurance companies, Dr. Porter said, and there are positive reasons in favor of it. The companies have a trained force of 80,000 medical examiners and 20,000 agents working among twenty million policy holders. "I know of no other single agency in all the wide field of sanitary effort so potentially powerful for public health." Further, "public opinion now asks that a corporation cease to be a mere accumulator of wealth. . . . It asks that it shall awaken to its opportunities and develop a human side to its existence."

DEADLOCK IN THE CHICAGO STRIKE

The Chicago garment workers' strike seems to have settled into a rigid deadlock in spite of unremitting efforts to effect a settlement. The new element among the bodies seeking peace is a committee representing the powerful Association of Commerce. This committee resulted from a conference between union leaders and representatives or some of the largest commercial interests in the city. Business men feel that Chicago's large clothing industry is menaced increasingly by each day the strike continues.

The arbitration terms which, as reported in THE SURVEY last week, Hart, Schaffner and Marx are willing to accept, were submitted by the strike leaders to their members. The members refused to consider them until the other employers were willing to agree, so that the whole 40,000 strikers would have a chance to vote and go back to work together—this in spite of the fact that the peace committee, which included John Fitzpatrick, president of the Chicago Federation of Labor, and Mrs. Raymond Robins, president of the Women's Trade Union League, recommended their adoption. The labor members of the mayor's conference sent a letter to the City Council, in which they stated that "the refusal of the representatives of the National Wholesale Tailors' Association and the National Wholesale Clothiers' Association to accept those terms of setlement, and the public declaration of their determination to 'fight to a finish,' have resulted in a feeling of resentment among the strikers and a natural desire to stand or fall together."

While this loyalty of the workers to one another is appreciated, many impartial observers regret that the 10,000 Hart, Schaffner and Marx employes did not return to work and express their loyalty by giving their comrades relief from their earnings.

In rejecting the proposed terms an element of fanaticism played some part, many of the Polish strikers being roused almost to a frenzy of defiance by an independent but misguided priest, who urged the strikers to stick for the closed shop. It is significant that the most tragic occurrence of the strike thus far took place near his church. A clash be-

tween pickets and police resulted in the killing of one striker and the wounding, probably fatally, of another. In the face of this violence the public temper remains calm, patient and fair, though more insistently determined to bring about a settlement. This attitude is well expressed by an editorial in the *Evening Post*, saying that the people of Chicago ought to be careful not to assume that all the 40,000 garment workers of Chicago are rioters because a few have battled with the police.

Impressed by the spirit and need of the strikers, the Chicago Federation of Labor at its meeting of December 18 decided to stand by and support them. This action was taken in spite of the fact that the federation had recommended the adoption of the proposed arbitration plan, and also in spite of a distrust which the federation, even more definitely than the public, has concerning the honesty and good faith of the president of the local garment workers' union. It was charged by some of the delegates that he and his coterie are personally appropriating some of the money contributed for the support of the strikers, and a demand was made that the books of the union be turned over to auditors. It is declared that such a request a few days ago met with refusal. In view of this situation, it is fortunate that much of the money is contributed, not to the local union, but to a strike fund of which Mrs. Raymond Robins is treasurer.

ART IN A DEMOCRACY

It was agreed on all hands that the address of Thomas Nelson Page at the last annual convention in Washington was one of the most charming and graceful of contributions ever made to the American Civic Association. He dealt unsparingly with several national foibles, but his allusions to the barbarous ways of government inspection of art works and the lack of opportunities for artistic education in America aroused enthusiasm. Art and literature, he said, are the only lasting things of a city's civilization, and the spirit of the people is manifested by its art. We go to Rome today, not in admiration of her historic power and commercial supremacy, but for the art which she bestowed upon the world.

J. HORACE McFARLAND.

Re-elected president of the American Civic Association.

Americans have every reason to be great in the things of the spirit. From the lands of the Latin and the Saxon to the land of—whatever we are—we find ourselves heirs of all peoples and of all ages. Yet think of the barbaric monstrosities which in the form of soldiers' monuments we have set up as our standard, as a terrifying spectacle of the best this country can achieve. Even the most devoted American cannot view the collection of effigies in statuary hall at the Capitol without a shudder at the grotesqueness of the group. The good are belittled by the bad.

Is the spirit of our people essentially non-artistic? Is our taste depraved by the soul-destroying cauldron of commercialism, the setting-up of the dollar standard as the measure of all human success and happiness? The artist wants art as free as the air, but government decrees otherwise. The result is that our native artists must go abroad to study and the native school never develops. The pioneers had much within them that was heroic, but in these days there is danger that the heroic will vanish in the mad ambition for money. There never was a time when America had more crying need of the refining influence of art.

Yet in architecture we have done better and the awakening was so unexpected and so great that it brings us much hope. Out of the worst period of American architecture, when we had all gone wild about mansard roofs and the so-called "style" of the much-abused Queen Anne, there suddenly arose a city within a city—a city like a dream of fairy-

Rogers in New York Herald.

TWO SANTAS.

land. Chicago, the parent city, had been regarded as the very center of sordid commercialism, but it gave birth to the "White City" —the "Snowy City"—which sprang up on the shores of Lake Michigan. It heralded the dawn of a better era, and architecture and city planning took a new step in this land of ours. In its planning and construction the White City really represented the greatest example of modern genius. Physically it has perished, but the spirit of its existence will ever survive to give inspiration to human progress, because it has stamped itself upon the imagination and minds of the people. Even now, as I look back upon it after nearly a score of years, it reminds me of one of the fine old mezzotints of Bunyan's Pilgrim's Progress—"a city white in the light of God."

To this World's Fair city Mr. Page traced practically all of our subsequent development in finer building and systematic systems of planning.

City planning and one other subject, the extermination or regulation of various urban nuisances, were the subjects to which especial emphasis was given at the meeting. Not a dull or unprofitable moment found place in any of the seven sessions, and even a scoffer at the ideals of civic development must have been impressed by the eminently practical character of the discussions. The association is making valuable contributions to the cause of "a better and more beautiful America," not only a country better and more beautiful to look upon, but more beautiful in the things of the spirit and better suited to be a happy and comfortable abiding place for a civilized people. The national scope of its influence and interest was strikingly indicated by the attendance, which was literally from Maine to California and from Minneapolis to Mexico. More than 130 delegates were present from outside Washington, and there was significance in the number of official state delegates who attended for the first time. In the words of Henry A. Barker, "Perhaps the time is coming even sooner than we dared to hope when American cities will cease to be the ugliest, most inconvenient, and most unscientifically designed of all the cities in the world."

CITY PLANNING
THE PRIME NEED

Experts discussed in thoughtful, definite ways, the work of improvement societies, the attainment of municipal cleanliness, and the regulation of public nuisances. But most significant in its bearing upon the future well-being of all those generations which must for ever live in urban communities, was the special emphasis for the first time given to the subject of city planning. It cut down through all earlier discussions of temporary conditions and remediable things to tackle the fundamental basic structure of towns and cities. Lack of thought and plan at the beginning or in the early stages of growth has piled up an awful penalty against the future. Franklin MacVeagh struck the keynote of this discussion in his simple proposition that "it is wholly stupid not to plan cities, like their individual buildings, with some view to the comfort and happiness of the people who must live in them." The conservation of the resources of nature and the scientific planning of man's artificial creations of cities and towns are supplementary movements upon which most of the future well-being of the nation depends. Most of their underlying principles are rather simple and understandable, but their popular recognition has been delayed in a supposedly enlightened country until the last decade. A notable group of the men who have led in the new profession of civic architecture and urban development participated in the discussion—such men as Frederick Law Olmsted of Brookline, John Nolen of Boston, Arnold W. Brunner, of New York, Harold J. Howland of the *Out-*

look, Charles Mulford Robinson of Rochester, George B. Dealey of Dallas and Clinton Rogers Woodruff of Philadelphia.

In his presidential address J. Horace McFarland put the question, "Are state parks worth while?" and although the answer was a foregone conclusion, his statement of it and the reasons aroused the greatest interest and enthusiasm.

Of other subjects taken up, space forbids even casual mention. Richard B. Watrous, the secretary, gave a full and interesting report of the association's work for the year, and there was a particularly practical discussion of the house fly, which Dr. Woods Hutchinson classed among the most dangerous and deadly of all the wild animals which have ever infected the earth. The moving picture exhibit of flies, which the association has made available for lecturers, was shown. The very wealth of the program and its practical application to local problems added weight to the secretary's recommendation, that two to four additional special conferences be held in different parts of the country to encourage local civic movements.

The officers were all re-elected — J. Horace McFarland of Harrisburg, president; Clinton Rogers Woodruff of Philadelphia, first vice-president; William B. Howland of New York, treasurer; Richard B. Watrous of Washington, secretary.

STATE CONFERENCE INVESTIGATIONS

If argument were needed to justify the cost of a state conference of charities and correction, the nineteenth session of the Minnesota conference furnished it. The number of institutional officials and county commissioners present was held amply to justify the State Board of Control in paying their traveling expenses and in circulating the proceedings. It is a strategic policy, too, to hold the annual business meeting of the State Association of County Commissioners at the same time and place. Year by year these men bring with them a first-hand knowledge of local conditions, especially in rural communities and small towns, such as no others can so readily acquire; and few can carry more widely away or put to more practical use the information and inspiration which are furnished by the conference.

McCutcheon in Chicago Tribune.

"POOR OLD HORSEY! WHERE'S YOUR BLANKET?"

Carrying its meeting to the border of the state farthest removed from the large city centers is also good propaganda, which was appreciated by Crookston's people, commercial club, churches and schools. One of the most suggestive papers was that on Making Country Life Worth While, presented by Superintendent Selvig of the State School of Agriculture, whose students thronged the crowded Opera House for the Sunday sessions. Local leaders conferred with those of the conference on the opportunity for organizing the charities of Crookston, through the incentive given to the town by the conference. A local anti-tuberculosis society was established as the result of the discussion.

Perhaps the most promising feature of the program was the evidence of patient, thorough inquiry into actual conditions with which public agencies and officials are dealing. The demand for such investigation was expressed by a large proportion of the speakers and was notably met by the papers of some.

The study of mental and moral characteristics of prisoners at the state reformatory by Supt. Frank Randall combined scientific spirit with humanely prac-

tical method. The intelligent, continuous, personal touch of the superintendent with each prisoner is supplemented by expert examination by alienists in all state hospitals for the insane. The results of their inquiry, which are to be published when completed, may be appraised by Mr. Randall's interesting reference to the arrested mental development discovered in a large proportion of prisoners. Tests of thirty of these "men," born from eighteen to thirty-one years ago, showed them to be children. One of them had the mental development normally attained at six years of age, two that at seven years, one that at eight, three that at nine, two that at ten, five that at eleven, three that at twelve, and only thirteen of them were developed beyond the twelfth year. Data thus gathered and analyzed will be most valuable for all at work with delinquents.

Fanny French Morse's cottage plan for the new school for girls at Sauk Center, based upon her work in Massachusetts and at Red Wing, had special interest, for she has been vindicated recently both by the Board of Control and by the Board of Visitors from the complaints inevitably arising from her readjustment of school management to modern standards. Her insistence upon the moral and educational value of every girl having her own room was enlightening.

The modern treatment of inebriety and the results and possibilities of adult probation were treated in the same exact and broad way. A questionnaire, including eighty-five counties in the state, proves the judges of the juvenile court to have begun to catch the spirit of this movement, and incidentally proves the efficiency with which Judge E. A. Lewis and his associates of the Probate Court are exercising their jurisdiction over children's courts.

The insight into local conditions and the courage in dealing with them at first hand, which social settlement residents acquire, were finely exemplified by Henry F. Burt, head resident of Pillsbury House, Minneapolis, in a paper on vice. It grew out of his experience in banishing disorderly resorts from the residential district surrounding the settlement. Some influential citizens of Minneapolis take this achievement as a demonstration of the possibility of suppressing public forms of prostitution in the entire city.

PURE MILK

IRA S. WILE, M. D.
New York

The troublesome question of how to secure a pure milk supply was discussed in its city, state and national bearings at the recent conference under the auspices of the New York Milk Committee. The meetings were significant in both program and attendance. From the United States there were official representatives of the federal Department of Agriculture, the Public Health and Marine Hospital Service, the New York state Departments of Health and Agriculture, and the New York city Department of Health; and from Canada W. F. Nickle of the Legislative Milk Commission of Ontario and Dr. Amyot, health officer of Toronto. Chicago, Philadelphia, Boston and Washington sent practical men to represent them. The attendance included milk dealers and producers, sanitarians, health officers, philanthropists, and transportation men, who gathered in serious debate over the numerous resolutions that formed an intrinsic part of the program. The four sessions considered in turn Milk Economics, Public Milk Supply and Public Health, Milk Commissions.

In delivering the address of welcome John Purroy Mitchel asked the conference to solve some questions which are disturbing the New York Board of Estimate and Apportionment. Most of them centered upon pasteurization, as it affects the cleanliness of milk and the price to the consumer. So far as the conference expressed an opinion on price it was that the farmer must receive more for his milk in order to raise his sanitary standards. The best method of securing an improved quality of milk was suggested by Dr. A. E. Harding of the Geneva Experiment Station. He would establish various grades of milk with a specified retail price for each, the cleanest to command the highest

price. Deputy Attorney General J. B. Coleman made a plea for a state commission to regulate prices. The constitutionality of such a commission was not established to the satisfaction of the audience, and a resolution recommending its creation was almost unanimously rejected.

A resolution calling for a comprehensive study of the comparative digestibility and nutritional value of raw and heated milk was promptly accepted, in view of the general feeling that the question has not been satisfactorily answered.

A strange note was heard from a legal representative of some small milk dealers, who argued that it was dangerous for the community to use bottled instead of "loose" milk. Experience and progress ruled against him, and there was no hesitation in voting that all milk sold at retail should be properly bottled.

The tuberculous cow received careful consideration, and while the farmers present opposed a resolution prohibiting the sale of cows until proved free from tuberculosis, as far as the tuberculin test indicates, they were willing at a later meeting to vote to forbid interstate commerce in cows not thus tested and found healthy.

The clash between municipal and possible state control of milk supplies came in a resolution that it is the sense of the conference that the work of country milk inspection be carried on by states and not by municipalities; that municipalities adopt minimum standards and refuse to accept milk which falls below them, and that state methods of milk inspection be uniform. The city health officers seemed to fear that state supervision would be inadequate. Their opinions swayed the meeting and the resolution was rejected.

The desire of the sanitarians to place the conference on record as to the grades of milk to be recognized by such state departments as are in a position to secure legislation regarding pure milk supplies, was gratified by the almost unanimous adoption of the resolution approving the classification of A. D. Melvin of the Bureau of Animal Industry of the Department of Agriculture. This recognizes three classes of milk: certified, inspected and pasteurized. The general trend of the discussion, under the influence of experts like Dr. E. C. Schroeder and Dr. John F. Anderson of Washington, Dr. William H. Park of New York, Dr. Amyot of Toronto, Dr. Charles E. North of New York, and Prof. William T. Sedgwick of Boston, was in favor of the perfect pasteurization of public milk supplies as the best method of averting epidemics of contagious diseases.

Appreciating the difficulties surrounding the sanitary questions involved in determining proper standards to safeguard public milk supplies and to regulate the production and handling of dairy products, the New York Milk Committee was requested to invite a committee of experts to confer and unanimously report on milk standards, from which congressional or state authoritities may formulate legislation. A unanimous report was urged, in order to avoid waste of time through the presentation of a minority report, which might confuse the issues involved.

The responsibility of consumers in securing pure milk was discussed by R. A. Pearson, New York state commissioner of agriculture, and F. A. Stadtmueller, health officer of Elmwood, Conn. Education of consumers was urged as to the relative food value of milk, the necessity of a clean supply, and the fact that perfectly safe milk, raw or pasteurized, requires a price which will permit its production. It was advocated that milk be so labelled as to show the consumer the grade he is buying, and that misbranding be held a violation of the pure food law, providing that official recognition be given the classes of milk advised by departments of agriculture.

In order that the resolutions passed might not be lost, and to assure a meeting of the conference another year, a committee was appointed to arrange for a national organization to promote the study and improvement of public milk supplies. The necessity for such an organization was unquestioned for, as Professor Sedgwick remarked, "the milk problem in America today is perhaps the toughest of all our pure food and public health problems."

WESTERN RESERVE CONFERENCE ON CHILDREN

FLORENCE L. LATTIMORE

What one of the local speakers happily described as "a continuous survey of child-life," is being planned as one result of the Western Reserve Conference on the Care of Dependent and Neglected Children, held in Cleveland November 17, 18, 19. Another immediate result is that the local workers in children's agencies have arranged to meet monthly at the various institutions for discussion of mutual problems.

The conference was called by the committee on co-operation of the Cleveland Associated Charities at the suggestion of twenty child-caring institutions. In addition to a three-day conference, with morning, afternoon and evening sessions, remarkable exhibits were made, in order to reveal the various kinds of help available for needy children.

The sessions and the exhibits were in a new and centrally located building. Both were well attended. Nine hundred and fifty individuals interested in children's work were registered at the sessions. About 1400 persons attended them.

Forty-five organizations took part in the conference. There were forty-one exhibits, four of which were from out of town, loaned by the Children's Aid Society of Boston, the National Child Labor Committee, the Russell Sage Foundation Department of Child-Helping and the Speedwell Society exhibit on infant mortality.

That the exhibits were graphic was shown by the crowds inside and out. The broad plate glass front of the exhibit room next the sidewalk was lined with business men, miscellaneous passers-by and children from the street trades staring in to satisfy a newly aroused interest. The room was broken into booths. Almost every exhibit was manned by someone familiar with the special work shown and ready to explain it to visitors. This greatly increased the educational value of the conference. Among the most striking features were the exhibits made by means of real children, such as those illustrating the work for the blind, the equipment and management of day nurseries, the free kindergartens, St. Ann's Infant Asylum and the Cleveland Public Library. Models of the tent colony for tuberculous children attracted much attention. Less graphic at first sight, but centers of quiet groups of thinking people, were the exhibits of the Humane Society, of the orphanages, and of the work done for children by the Associated Charities. So successful was this display that it was kept open by special request after the conference had closed.

In the conference proper a day was given to discussion of each of these subjects: the Dependent Child and the Institution, the Dependent Child and the Foster Home, and Co-operation of Child-Caring Agencies. The out of town speakers were Martha P. Falconer, the Rev. Brother Barnabas, Hastings H. Hart, Edwin D. Solenberger, and R. R. Reeder. One or more of these speakers were present at round table discussions in the mornings, attended the noon luncheons at the Chamber of Commerce, and led the discussion of the afternoon and evening. Every child-caring agency had an opportunity to describe its particular work. Such descriptions, and the many addresses by local people dealing with special program topics, brought out with compelling force the need for further knowledge of each other, and for some general plan by which the local agencies may become in reality what they are already in spirit—a closely knit children's constituency.

The Jewish, Catholic, and Protestant child-caring organizations in the Western Reserve have already developed some degree of co-operation with such investigational agencies as the Associated Charities and the Humane Society; but, although there are many institutions in and about Cleveland, unity of effort is not strong enough to meet the needs of the community. Whether or not the movement for centralization of work should be expressed by a children's bureau, or by some other plan of organization, was discussed by A. B. Williams, Jr., secre-

tary of the Cleveland Humane Society. He said, in part:

It is easy to see the large field of usefulness for a children's bureau in a city where the charities are comparatively loosely organizd and working without much reference to one another. Frankly, I believe that Cleveland is beyond this and that we are ready for an advanced step, which I think has as yet been possible in scarcely any city, but which I believe to be possible here. Our charities are, generally speaking, fairly well organized and efficient. We already have in operation a Clearing House, where last week 549 families were registered—more than ninety a day. If the children's institutions will avail themselves of this piece of co-operative machinery, it will do all that a children's bureau registration scheme would do, and more. . . . In the Associated Charities we have a most efficient investigational agency, which will undoubtedly be glad to undertake any pre-admission investigation for any institution that desires it. A number of the institutions are requesting the Humane Society to advise regularly as to the admission of children. By utilizing either one or the other of these two agencies, any institution desiring to avail itself of the work of expert investigators could easily do so. In the matter of physical examinations, I believe adequate arrangements could be made with certain of the hospitals, the Babies' Dispensary, and other medical charities. That is, the main features of a children's bureau are already at work in Cleveland, or immediately available.

I believe we have passed the children's bureau stage, and are ready to take up together, as we have begun to do at this conference, a systematic, comprehensive study of the entire children's problem of Cleveland and vicinity, and to devise plans together for meeting the need so disclosed. First of all we must know the situation and we must all know it, whether it touches our particular field of effort or not. My suggestion is this: that our conference proceed to organize on a permanent basis, changing the name to the Western Reserve Conference on Child Welfare. This will so broaden the scope of the organization as to cover the entire field of childhood. Let the conference have a definite membership of organizations and interested individuals, with a membership fee small enough not to be burdensome, but which will produce revenue sufficient to run the organization. Let the objects of the conference be the study and solution of the problems of the childhood in Cleveland and vicinity. The work should be done by a number of standing committees composed of interested men and women who should work throughout the year on a particular problem. Some of the subjects awaiting thorough study are, for instance, the causes of child neglect and dependence, non support and abandonment, infant mortality, infantile blindness, child labor, feeble-mindedness, dependent mothers with infants, play, education (with several possible sub-committees, neighborhoods, street trades.

The creation of these committees would bring about what would practically amount to a continuous survey of the child life of Cleveland. The backing of the conference would open up all the sources of information in the city, and enlist the services of many not perhaps members of the conference itself. The work of these committees would be a continuous city-wide educator. The reports at the next conference would be rgal contributions to the knowledge of childhood in our cities. Our succeeding exhibits could set forth these conditions in detail, and succeeding conferences take action looking towards making Cleveland the best place in America for children to live in. This plan would furnish splendid opportunities for us all to work together.

The committee on findings reported upon twelve points and made six definite recommendations. The following points received special attention: that family life is the best life for the child; that constructive work should be done in the home of the child; that "if the maintenance of the home be an impossibility, then the best substitute seems to be another home offered by desirable foster-parents, unless deficiency on the child's part require attention which an institution will better afford"; properly supervised boarding homes for children, the cottage system of housing, physical examination of incoming children, the formation of a strong placing-out agency, adequate record systems, thorough initial investigation of every case of neglected dependence before prescribing treatment, proper use of legal machinery, the keeping of infants and mothers together, the importance of breast feeding, the employment of socially trained workers in child-caring work, and special attention to supervision of play and exercise.

The committee urged further utilization of the facilities offered by the Charities Clearing House; frequent meetings of workers in children's agencies for an exchange of experience and method; the appointment of one representative from each organization taking part in this conference to serve upon a central committee on child-welfare; the appointment by this central committee of sub-committees to arrange for future conferences and to co-operate with state, county and city institutions which receive and care for

children from Cleveland and vicinity. The chairman of the conference, James R. Garfield, appointed to serve upon this organizing committee: M. A. Marks, Judge George S. Addams, Cordelia L. O'Neill, Douglas Perkins, with A. B. Williams, Jr., secretary.

OF CHRISTMAS GIFTS

MARY E. RICHMOND

Genius and a penny whistle—both are gifts. When the customer asked what the imitation bronze elephant with a rose in the tip of his trunk was *for*, the clerk replied with dignity and with unconscious humor, "That, madam, is a *gift*." Somewhere between the heaven-sent gift of genius and the elephant and the whistle belongs too the old Saxon use of *"gyft,"* which meant, by a pleasant confusion of ideas, both the dowry and the marriage, and celebrated, in both uses, a relation already existing.

This brings us—not by easy stages but by express—to our real theme; to the type of gift, that is, which celebrates, and fittingly celebrates, a human relation.

If the social workers who know distress at close quarters could speak their minds out freely without danger of being misunderstood, if they could tell the bald, ungracious truth about this wholesale Christmas of ours, they would probably say that they are more saddened than cheered by it. In so far as its giving expresses insight and thoughtfulness and consideration, they love the old custom and would not willingly see it pass; but in so far as it blazons abroad and makes more obtrusively visible the *absence* of relation and thoughtfulness and consideration, as between those who give and those who receive, they cannot love it—they are silent, for the most part, but they count the days when this side of Christmas, with its exploitations of need and its ostentatious distributions, shall have passed away for another year.

Often it is their duty to take the Christmas giver where they find him and to move him on, a half-step at a time, perhaps, to some realization of what desperate poverty really means both to the desperately poor and to the community.

Morgan in Philadelphia Inquirer.

THE SPIRIT OF CHRISTMAS.

The Christmas giver as they find him! He means so well. He wishes (if Anglo-Saxon) that everyone may have turkey to eat, or something equally good, on Christmas day. He pictures this meal as a family rite, partaken around the family board, unless his mind is confused by the schemes of agencies that "hire a hall" and feed at wholesale. Not one little flickering flame of desire on his part to "do good" and be helpful should the social worker extinguish. To end this dun-colored Christmas article just here, therefore, would be little short of a crime.

Extensive and aimless giving to those whose needs are little known, and expensive and equally aimless giving to those who have no needs (that money can meet), will continue in spite of anything one can say. But there is always another way open to those who have begun to feel the waste and the neglected opportunity of Christmas. This is the great family holiday of the year, and its sweetest expression is in a family life wholesomely intact and self-perpetuating. Such was the life of the little family group whence the idea of Christmas radiated centuries ago; such is or can be the life, the relation, that we celebrate today. Side by side with our wholesale, extensive, somewhat bacchanalian Christmas, may be developed quietly a Christmas of human relations and of *intensive* giving.

In so far as this second Christmas has

to do with poverty and want (and it should have a great deal to do with them) it would seek to make its good-will and its recognition of existing contacts permanently helpful; it would strive to see that the recipients of holiday cheer were faring better on the days that were not feast days; it would, for instance, feel ashamed if, before next December, it had put forth no effort to make them better able to shape their own Christmas celebration in their own fashion; and, above all, it would endeavor, in little thoughtful ways, to bring forward the fathers and mothers as the rightful "good fairies" of the Christmas drama, it would magnify the dignity and importance of parents who live in tenements and mean streets.

All this and more was done, very quietly, in some of the district offices of the New York Charity Organization Society last year, and it is being tried again this year. In one of these districts, three widows with small children were pensioned for a whole year out of the Christmas money of a few donors. This meant that these mothers knew every day in the year 1910 just how much to count upon, just how to plan. It meant that a great burden of anxiety was lifted, and lifted by those who could safeguard the family welfare in other ways. For instance, some of the children were given a chance to earn their mothers' presents, and were helped to keep them as a happy little surprise. A church circle of young people, developing this idea further, organized this November a class of children from families known to the district office, and taught them how to make presents for their parents. The office is a safe storage place where the young people of the neighborhood are keeping packages that are to be brought out on Christmas Eve or Christmas morning for the older members of their families.

While widows' families received most attention, help was not limited to them. When a committee member offered to entertain one group at her own home on Christmas Eve, children whose father and mother had both drifted into careless, drunken ways were sent to her, and the parents have since been braced up by close personal work. One elderly single woman with no family had a present of a regular monthly pension.

Around the office tree six parties were held during Christmas week by twelve members of the local committee. Parents and their children came together in small neighborhood groups, and last of all the old ladies of the neighborhood had their own special party. These small parties are still talked about because they celebrated a friendly relation already established.

This was not a statistical Christmas—it made no great showing in figures. We are stupidly possessed with the idea that, in order to do a thing at all, we must do all of it at once from the very beginning. The idea of intensive giving will not grow all at once, everywhere, but it will grow. We can always begin with the next person we know who is having a hard time, taking pains to think ahead for him or for her. We can try to do things that will last; we can try to strengthen the family ties and bring out their lovelier side; we can look forward hopefully to making our help less necessary, to removing the untoward conditions that make it necessary; we can show our pleasure in a relation that, however slight, has within it undeveloped possibilities of sympathy and understanding.

And if, by any chance, we look about us at this Christmas season to find that we personally know only those as well off as ourselves, or better off, if our way of living has brought us to such poverty as this, then at least we can resolve that no other Christmas "shall find us then as it finds us now,"—that we will enlarge the circle of our acquaintance, if only to know the pleasure of that intensive giving which includes both knowing and caring.

OF NEW IDEALS AND THE CITY

JOHN HAYNES HOLMES
Church of the Messiah, New York

The history of municipal government in this country may be said to have gone through three very distinct stages of development. In the first place, there was the period when the city was regarded as a rich field for political exploitation.

The municipal government was simply an overflowing treasury of wealth, for the looting of which the contending parties had their annual political battles. This period covers the entire history of our nation, from early colonial days down to the decade immediately succeeding the Civil War; but its real significance became clearly manifest only in the seventies and eighties, when there began that astounding era of urban development which has not yet ended, as is so convincingly attested by the census of this present year. It was at this time that there began the rush of population to our municipal centers, the phenomenal development in the cities of industrial enterprises of every description, and the miraculous extension of facilities for transportation and communication. Then came the hey-day of the city politician. Contracts for stupendous municipal undertakings had to be let, franchises for public facilities of all kinds granted, industrial permits issued, real estate values appraised, methods of taxation developed, police supervision indefinitely extended; and in all these matters, incalculable sums of money expended. There was millions in it" for the politicians, and, as a result, they flourished as the green bay tree. This was the period, it is well to note, when Mr. Bryce was studying American political life in preparation for writing his American Commonwealth; and it is not to be wondered at, that in this book he characterized our municipal governments as the one conspicuous failure of our civilization.

This period reached its climax with Richard Croker's immortal declaration upon the witness stand, that he was in politics for his pocket all the time. With this brazen confession may be said to have begun the second period of municipal development. In the old days, vast sums of money had been thrown away or stolen. Everything had been run upon a purely political basis, which meant waste, extravagance, and incredible dishonesty. The natural reaction from this saturnalia of civic crime was in the direction of what was called "business administration." The city, it was said, is nothing but a gigantic corporation. It must therefore be run, as any private corporation is run, on strictly business principles. Business men must be elected to office; scientific business methods must be introduced into all departments of administration; above all, strict economy must be practiced in all expenditures of public funds. City administration, in other words, is simply a matter of debit and credit. Let that be fully established, and our municipal problems will once for all be solved.

It goes without saying that this business ideal of city government, which is now rapidly coming into the ascendant everywhere, marks a well-nigh immeasurable step of progress over the old ideal of political freebooting. Most of our cities have become highly organized business organizations, many of them run by trained and honest business men. Waste is being stopped, graft eliminated, downright thievery abolished, and the strictest economy of expenditures everywhere practiced. The people are regarded by the city officials as in a measure the stockholders in the municipal corporation; and the faithful public official is regarded as the man who acts consistently in the interests of these stockholders. In other words, city administration is coming to be regarded as one highly specialized department of American business enterprise; and in the light of this conception the ideal municipal officer, in the eyes of many reform organizations today, is the expert business man, and the ideal administration the one which can show reduced expenditures and a lowered tax rate.

Now it is of course admitted that all of this is admirable, and that every particle of the real progress which has been made here must be conserved. But slowly it is coming to be recognized in our time that there is also a third step of progress which still remains to be taken. Scientific methods of administration, honesty, economy, etc., are all right, and must always be maintained as the established and fundamental details of business operation. But there is nevertheless a basic fallacy involved in the conception of the city as a mere business corporation. It

is all of that, we admit, but it is much more besides. And it is the gradual recognition of this fact, in the minds of charity workers, social reformers, physicians, clergymen, and enlightened city officials themselves, which is taking us into the third period of municipal development, where the city is regarded not essentially as a treasury to be plundered, nor yet as an elaborate business corporation to be managed, but as a great family to be guarded, guided, controlled and uplifted. The true conception of the city is that drawn, not after the pattern of the business office, but after the pattern of the home. The municipality is nothing but a great aggregation of people, confronted with the problem of living together within the more or less extended bounds of a common habitation. The municipality, in other words, is a community, which, as the very word implies, is based upon the conception of the common life. Now this means something more than matters of mere business administration—something more than problems of mere debit and credit in the city ledgers — something more than mere economy of expenditures, the stoppage of waste, the elimination of graft, and the abolition of corruption. It means that the city is "the steward of the public welfare" of hundreds of thousands of people. It means that the city is confronted by the problem of guarding and fostering the interests of all these people, both individually and collectively, just as the brothers and sisters in the home are charged with the task of guarding and fortifying their interests as members of a common household. It means that the machine of city administration is nothing but a mechanical device for enabling vast numbers of people to get together and achieve certain common tasks for fostering the common life. And, most important of all, it means, in terms of practical endeavor, that the basic policy of our city administration must be transformed. The ideal thing today is not a business administration, but a social administration; the ideal city official is not the business man, but the man whose whole life is aflame with the spirit of brotherhood; the ideal achievement of municipal rule is not economy, but the development of new sources of revenue and the construction of new channels of social expenditure. We are still, as I have said, in the period when a city administration believes that it can best justify itself by showing a reduction of the tax rate and a ten per cent cut in the annual budget—for this is the business ideal! But we are coming to a period, I trust, when a city administration will know that it can best justify itself by showing an increased tax rate, justly applied by new systems of taxation to the shoulders of those financially able and morally obligated to pay, and a ten per cent, twenty per cent, or even fifty per cent, increase of the budget for such works as are elementary necessities of the common welfare—for this is the family ideal of "each for all and all for each"!

Now it is the "new social conscience" of our time which is largely responsible for this new conception of the city as a family, faced with the problems of family life; and it is the people responsible for the development of this "new social conscience" who should make it their business to develop this new and resultant conception of municipal affairs. Our cities are today in the hands of business men, who with few exceptions have no ideals of administration beyond those of the business corporation; it remains, therefore, for these cities to be captured by the social workers. Just as the business man conquered and overthrew the politician, so now must the social idealist conquer and overthrow the business man. The end of the political period of city administration was the politician's confession that he was working for his own pocket; the end of the business period of city administration should be the business man's confession that he is working for economy. Economy is all right as a method of government, but all wrong as an ideal; and it is economy as an ideal which is now before us. What we need today are new sources of revenue, new and just systems of taxation, new and larger channels of social expenditure; and these will come as soon as the family conception of civic government becomes dominant in the public mind.

THE STORY OF A FENCE

From the Philadelphia North American

In the current number of THE SURVEY Francis H. McLean tells of El Paso's fence. Mr. McLean uses the story to illustrate the conditions in that border town, where our great empire of Texas meets the empire of Diaz.

It is related that when President Taft and President Diaz had their famous meeting in El Paso, the committee on arrangements discovered that the line of progress at one point was bordered by a most insolent and disreputable row of houses. These were the homes of the common laborers and others of that grade in El Paso. The houses were an offense to the committee's sense of the aesthetic and, we have no doubt, also to its sense of smell. This nest of squalor had been festering lo! these many, many years.

Now the committee on arrangements, as all committees on arrangements are, was composed of the best people of El Paso and the surrounding territory: the solid business men, the eminently respectable guardians of peace and prosperity and property rights. We take it that some of them owned large sections of the dilapidated tenements and had been drawing easy money from the tenants, perhaps for a generation. If this conjecture isn't true, it is only because El Paso is different from Philadelphia.

However, after enduring the sight and the smell of the adobe shacks for years, El Paso suddenly discovered that they were not a proper setting to a royal triumph. They didn't look well as a background for a presidential show.

But El Paso was equal to the occasion. It solved the problem with neatness and dispatch. It built a fence along the highway, so that the noisome shacks were hidden from view.

The shacks were still there, with all their power to breed disease, in all their menacing filth, in all their mute protest against the social and economic wrongs of which they are the product.

But they were hidden from sight of the distinguished visitors. El Paso was saved from embarrassment. Her slums did not mar the beauty of the stage picture.

If the reader has the slightest spark of imagination, he can see in his mind's eye how the eminently respectable and well-groomed committee became deeply interested in affairs of state as the procession passed that friendly fence. He may laugh a little at the desperate attempt of the good gentlemen to hide the insistent aroma of squalor under a cloud of loquacity. No doubt they convinced themselves that by talking fast and hard they kept the minds of the visitors off the miasma that arose from behind the fence.

If they didn't do this, it is because they are different from the eminently respectable men, their brothers in business, of Philadelphia.

And what has Philadelphia to do with El Paso's fence? Nothing, unless it be to compare notes as to the relative serviceability of that fence and of Philadelphia's fence.

"But," says the innocent reader, "Philadelphia has no fence." Yes; and a year ago the same innocent reader would have said that Philadelphia has no slums. That was a pleasing fiction, fondly circulated by Philadelphia's committee on arrangements, the men who keep the fence up. Yet an official report by investigators shocked us by saying that this city had a tenement problem second only to one other in the country.

This fact was widely published, despite the committee on arrangements. But Philadelphia sits contented in her comfortable homes, unmindful of the ghastly menace behind the fence, where disease and death walk hand in hand with squalor, where scanty food and polluted water and filthy air and ceaseless toil for elders and joyless childhood for the young ones conspire to undermine the very foundations of our social structure.

The committee on arrangements may talk long and hard about the blessings of the tariff and the wickedness of sowing discontent and the benevolence of the good men to whom God has intrusted the property interests of the country. But talk as they will, they cannot disguise

the fumes that steam up from behind their fence.

It is just a suggestion on our part. But wouldn't this Christmas season be a good time to break down the fence and let the community have a look at the dangers that lurk behind that flimsy wall of cant and fraud?

BOOKS FOR SOCIAL WORKERS

LILIAN BRANDT
Contributing Editor

UNEMPLOYMENT AND TRADE UNIONS. By Cyril Jackson. Longmans, Green and Company. New York. 1910. Pp. 92. Price 50 cents; by mail of THE SURVEY 55 cents.

In Great Britain the problem of unemployment has for some time been a political issue. The question now is the practical one of choosing measures for bringing about reforms which all admit are needed.

Reviewing the measures which have been tried or suggested—relief works, labor exchanges, unemployment insurance, better distribution of work, and so on—Mr. Jackson concludes that in each case success must depend on management by trade unions or their cooperation; and that the only remedies for unemployment that have been tested by experience and have proved successful are those which trade unions have worked out for their own members. He therefore advances the novel, though simple, idea that the government should subsidize the unions for the purpose of extending their methods.

Such a strengthening of the unions as this plan would entail is not likely to commend itself strongly to the British employers, since they do not generally share the author's confidence in the unions. On the other hand, the course laid out for the unions to pursue, in order to get the government's support and subsidies, will hardly appeal to the labor men, since they are counselled to abandon their political activities. It is not probable, therefore, that the scheme will find favor widely.

REVIEW OF LEGISLATION. 1907-8. Edited by Clarence B. Lester, legislative reference librarian New York State Library. Education Department Bulletin No. 479. September 15, 1910. Price 25 cents.

The topical review of legislation by the different states on a selected list of important topics, which the University of the State of New York has compiled and published for a number of years, is now available for the two-year period ending October 1, 1908. With this number the plan is adopted of issuing the review bi-annually, as in many states the legislature meets only every other year. While the reasons for adopting this plan are obvious it is equally obvious that it will increase still further the interval between the enactment of much of the legislation and the time at which this review is given to the public.

STORY TELLING—WHAT TO TELL AND HOW TO TELL IT. By Edna Lyman. A. C. McClurg and Company. Chicago. 1910. Pp. 227. Price 70 cents; by mail of THE SURVEY, 76 cents.

This looks like a useful little book for anyone who has occasion to practice the art of story telling either as a vocation or as an avocation, in the home, at school, at church, on the playground, in the public library, or in any of the other many places which are being affected by the recent revival of this world-old educational method.

TENEMENT HOUSE INSPECTION. By George M. Price, M. D. The Chief Publishing Company. New York. 1910. Pp. 287. Price $1.50; by mail of THE SURVEY, $1.58.

Dr. Price has rewritten, and, as he modestly hopes, improved his text-book for candidates for positions of inspector and clerk in the New York Tenement House Department, which were first published in 1904. Pages 127-204 contain the questions which have been asked in the civil service examinations for these positions in the last eight years, and also answers to them.

THE FAMILY HEALTH. By Myer Solis-Cohen, M. D. The Penn Publishing Company. Philadelphia. 1910. Pp. 267. Price $1; by mail of THE SURVEY $1.10.

This is a handy book of practical medical suggestions, intended for the education of the lay mind, by a well known medical writer. Among the seventeen chapters are those on The Dwelling, Civic and Domestic Hygiene, Insect and Animal Carriers of Disease, Bathing, Clothing, The Mind and the Nervous System, The Eyes and Ears, Food, The Care of the Infant, Domestic Medicine and Emergencies.

A great many subjects are briefly presented in a very clear and instructive way, but it is possible that the treatment is altogether too brief, that is, that the author has attempted too broad a subject in this small volume. One totally ignorant of medical subjects would gain a very clear, if limited, idea of medicine. But there is today no very large number of persons who are totally ignorant of these subjects. The daily papers and the journals have been careful to offer a variety of opinions, and many of the general public who are interested in medical matters believe that their knowledge of certain medical problems is quite equal to that of any doctor. For this reason a book on popular medicine is valuable, not so much as a source of new facts, but in proportion as it can correct erroneous notions. The layman with erroneous notions is not convinced by a simple statement by a

doctor of a medical truth, albeit the statement may be quite accurate. He requires a volume for each of several of the subjects treated in this book, and so, although the author has given very telling figures to make convincing his opinion on some of the most hotly disputed topics, it seems on the whole inadequate, and it is unfortunately not illustrated at all.

THE DIARY OF A SHIRTWAIST STRIKER. By Theresa Serber Malkiel. New York. 1910. The Co-Operative Press. Pp. 96. Price 25 cents (paper) 50 cents (cloth); by mail of THE SURVEY 5 cents extra.

Mrs. Malkiel was not herself one of the shirtwaist strikers, and her book does not sound, to many who were in close touch with them last winter, like a *bona-fide* account of the strike written from day to day by an American-born working girl who participated in it. It is really a story of the conversion of a shirtwaist maker and her "steady" to socialism in the course of the strike, and no opportunity is lost to make bitter comments on every element of society except the "working people" "A certain socialist's impression of the strike" is what the author has really given to the world in this publication.

COMMUNICATIONS

NIGHT MESSENGER SERVICE

TO THE EDITOR:

During the past year the National Child Labor Committee has engaged in an extensive investigation of child labor in the night messenger service. The reports were placed in the hands of local committees in a number of states, resulting in some instances in the enactment of restrictive laws. The most advanced of these was a law passed by the New York Legislature, providing that no minor child in cities of the first and second class should be employed at this occupation between ten o'clock P. M. and five o'clock A. M. This bill was not opposed by any of the companies engaged in the messenger business, but evidently some friends of the industry are not satisfied.

The *Telegraph and Telephone Age* for October contained an editorial denouncing as radical and unreasonable the legislation on night messenger service in New York and elsewhere secured by the National Child Labor Committee with the co-operation of other organizations[1]. The editorial was widely distributed among newspapers and extensively reprinted. On October 7 the New York Child Labor Committee published in the *Evening Post* a carefully prepared reply in which the chief grounds of objection to the employment of young boys at night were set forth and the argument reduced to the simple proposition whether the employment of minors after 10 o'clock at night as telegraph messengers is a desirable occupation.

This statement elicits another editorial in the current issue of the *Telegraph and Telephone Age*, which accepts the challenge and says "there are several interesting points for analysis in this statement of the case."

Proceeding to the analysis, the editor asks three direct questions, to which we are glad to respond without hesitation:

1. "Are the morals of youth any more in danger at the age of sixteen than at twenty-one?" Answer: Yes.

2. "Are the morals of a city more vicious at 10 o'clock than at 9 o'clock?" Answer: Morals are never vicious. Immoral forces in large cities are notoriously more unbridled late at night and presumably there is more danger at 10 o'clock than at 9 o'clock. Those familiar with the evidence gathered, however, would welcome prohibition of this service at 9 o'clock if the editor prefers.

3. "Is the delivery of a telegram at night a more undesirable occupation than the delivery of newspapers or the early morning milk?" Answer: (*a*) Delivery of "a telegram" is a small part of the night messenger's work. The bulk of his service is in gathering and delivering other kinds of messages and performing other kinds of service, not only to and from, but within gambling houses, saloons, houses of prostitution and other equally undesirable places. (*b*) We do not commend the present condition of newspaper delivery. The unrestricted exposure of little boys to this unnecessary work is a reproach to nearly every large American city. (*c*) Nor do we approve the exploitation of the little child or half-grown youth in "delivery of the early morning milk." The profits in the milk business are without doubt sufficient to warrant employment of adults in places now so frequently occupied by children for whom it is far more appropriate as a diet than as a burden.

The editor then proceeds to argue on two assumptions: first, he says, "We assume that the committee now pressing this child labor legislation is actuated by motives to safeguard the morals not only of minors, but also of those past legal age." The assumption is unfounded. The committee which made and published the results of this investigation is a child labor committee. However deeply interested its individual members may be in conserving the health and morals of our general citizenship, it recognizes that as a committee its interest must be confined to those legally wards of the state, viz: those under twenty-one years of age.

The second assumption has better foundation. He says, "We assume that the committee takes into consideration the important feature of not destroying the earning power of the embryo citizen." Precisely, and although the wreckage of juvenile character as a result of contamination in this service has received more publicity than any other feature of the problem, the committee regards the economic aspects of the night messenger service para-

[1] See THE SURVEY for October 8.

mount. It is because this particular kind of work ordinarily contributes to "destroying the earning power of the embryo citizen" that we look upon it with disfavor. If the service from the beginning paid an adequate wage, or if it offered a sure road to industrial efficiency, many would doubtless condone its menace to character and health in view of the economic advantage to be gained. It is therefore fortunate that the thirst of our people for industrial achievement finds no bulwark here. There are forms of labor in which a child may wisely be employed at sixteen or even fourteen years of age, under proper regulations. The night messenger service, to the majority of boys, is an industrial blind alley. Instead of being an avenue to higher industrial opportunities, the work leaves the boy at the end of one or five years as undeveloped industrially as when he began. Meanwhile his years have been absorbed, his energy sapped, his sensibilities blunted, and his ideals shattered.

The editor of the *Age* next attempts to lay upon us the burden of eradicating the so-called social evil, of putting an end to all gambling and disorderly houses; or if immoral conditions must exist, asks: "Why should not the committee work to have them confined to a certain designated district from which young and tender messengers should be prohibited"? Certainly a modest contract! Again we disclaim responsibility, as a child labor committee, for eradicating evils that have baffled the foremost experts in social reform. We may lay claim, however, to a serious attempt to place such restriction about growing youth that the exigencies of their employment shall not force them into immediate contact with these vices.

The public cannot be led astray by the contention that "of the total amount of duty which a messenger boy must do at night, more than ninety per cent is of an advantageous character" nor that the service "is healthful outdoor work, far better physically than indoor confinement". Whenever the question has been fairly put the public has not been slow to decide whether the purchase of opium for prostitutes, guiding strangers to haunts of vice, catering to gamblers and drunkards, is of an "advantageous character." If the editor of the *Telegraph and Telephone Age* has any statistics to controvert this evidence, he will oblige us by submitting them. We admit that it is outdoor work, and we hold no brief for the "indoor confinement" at night of children and growing youth. But we have no evidence that the kind of outdoor work required in this service, exposing to all sorts of weather conditions, is better physically than even indoor confinement.

The editor closes with a statement he regards as final. He says: "Men will not work as messengers. Only the semblance of men will take the job." This is certainly not complimentary to the business. The answer to the charge is that since October 1 men *are* employed in this city, and so far as we know, with satisfaction to their employers and to the public. Of course the wages are small, for it has always passed as a "boy's job." But we have thus far discovered no kind of employment in which real men are unwilling to engage if the compensation is attractive. It was acknowledged by one of the representatives of a messenger company that their wage scale represents twenty-five dollars a month to messengers. We know of instances in which night messengers are paid not to exceed eighteen dollars a month and we cheerfully submit to the citizens of this country that no industry has a right to utilize the time and strength of our youth without rendering financial compensation sufficient to purchase food and shelter. The industry which fails to do this is partly parasitic, depending upon public charity, emergency hospitals, relief societies, reformatories and public poorhouses to supply the differential between what they pay and a living wage. A service which cannot pay its employes more than twenty-five dollars a month should be re-constructed on a higher economic plane, or abandoned altogether. If, however, public opinion is not sufficiently advanced to demand such a step, we suggest that cripples, elderly persons, industrial misfits and others beyond the probability of being tempted to wrong-doing, and to whom the meager wage would be a welcome alternative to their present poverty, might well be substituted for growing boys.

OWEN R. LOVEJOY,
General Secretary,
National Child Labor Committee
New York.

THE BAKER & TAYLOR CO.
33 East 17th Street - - New York

BOOKS OF SPECIAL INTEREST

Four books published by Charities Publication Committee fill spaces hitherto unoccupied in the social worker's library shelves. All are finishing a successful first year with early prospect of a demand for second editions—in the case of Social Forces, a third edition.

OUR SLAVIC FELLOW CITIZENS, by Emily Greene Balch, of the Faculty of Wellesley College. Price $2.50

Miss Balch was uniquely qualified to write a study, both critical and interpretive, of these newer elements in our immigrant stock. She spent one year in the peasant villages of Austria-Hungary and another as a resident in the home of a Slavic workman in New York. The book has received unusual attention at the hands of reviewers in such critical journals as "The London Spectator," "The New York Sun" and "The Springfield Republican." It is profusely illustrated with maps, charts, tables, photographs by the author and by Hine and reproductions of old portraits and paintings. Large 8vo, 550 pages, handsomely bound in bright Slavic red.

HOW TWO HUNDRED CHILDREN LIVE AND LEARN, by Rudolph R. Reeder, Superintendent New York Orphan Asylum at Hastings-on-Hudson. Price $1.25

A uniquely interesting description of what is probably the best known "cottage plan" institution for children in this country. Dr. Reeder approaches his subject from the viewpoint of an institution superintendent, a school teacher, a social worker and a father. His thoughtful plans for making each cottage a real home and for developing in the children the sort of training which will fit for life and labor as well as for graduation, has been hailed by a number of writers as something that could profitably be applied to every household in the land.

VISITING NURSING IN THE UNITED STATES, by Yssabella Waters of the Henry Street (Nurses') Settlement, New York. Price $1.25

Miss Waters' book gives a brief history of visiting nursing and a concise description of the organization, the history and the current work of all visiting nurse associations in the country and in department stores, factories, women's clubs and other organizations which maintain visiting nurses. It appeared during the year which marked the fiftieth anniversary of the movement and was also the year of Florence Nightingale's death. Miss Waters writes from a long experience as a resident of the Nurses' Settlement in New York, the pioneer institution in this country. The book is of the greatest interest and value to those interested in visiting nursing, and is indispensable to one planning the organization of such work.

SOCIAL FORCES, by Edward T. Devine, Editor The Survey, General Secretary New York Charity Organization Society, Schiff Professor of Social Economy, Columbia University. Price $1.25

This little book, uniquely printed and bound in brown Japan paper over boards, comprises twenty-six of Dr. Devine's editorials written for "The Survey" under the title "Social Forces." Only those which had a lasting value were chosen. It includes his New View, The Right View of the Child, The Social Ideal, The New View of Poverty, The Breadline, A Christmas Survey, What We Believe, and other of his most widely quoted essays.

THE COMMON WELFARE

FIRE RELIEF IN MINNESOTA

The report of Ernest P. Bicknell, national director of the American Red Cross, on the relief work following the forest fires in Minnesota in October, shows an exceptional degree of effective co-operation in bringing about just the right results. Local, state and national authorities secured and administered prompt and adequate relief—the contributions reached $75,000; a threatened epidemic of typhoid and possibilities of disorder were averted; a permanent relief plan was quickly schemed out and applied; and the district, inhabited almost entirely by thrifty Scandinavian immigrants, is already half on its feet again.

The fire started on October 7, and driven by a high wind quickly burned over an area estimated by the State Forestry Board at 1,600 square miles. Governor Adolph O. Eberhart of Minnesota, president of the Minnesota Board of the Red Cross, promptly issued a temporary proclamation calling for funds, sent to the burned district two companies of the national guard, to which later two more were added, called to the front a relief committee composed of Attorney General George Simpson, Secretary Joseph H. Beck of the St. Paul Manufacturers and Jobbers' Association and Eugene T. Lies, secretary of the Minneapolis Associated Charities, who is also the institutional member of the Red Cross for Minnesota. The governor designated men, including the mayors of all cities, to receive contributions of money, provisions and clothing, and the next day went to the scene of disaster himself. The next day Mr. Bicknell was there with him. The railroads carried supplies free and local relief committees were widely organized.

The burned district was pretty thoroughly stripped of all houses, farm buildings and machinery, cut logs and sawed timber, and the live stock and standing timber were killed. About thirty persons lost their lives, mostly on remote clearings. Many were saved by crawling into root cellars and standing in the streams.

The only villages of importance were Beaudette, with 1,150 inhabitants, and Spooner, 850, separated by a small stream. These were completely destroyed except for the sawmill, Spooner's sole industry. Pitt and Graceton, tiny hamlets of forty and twenty-five inhabitants, were wiped out. The farms and little clearings which characterize the district were primitive, but often represented years of the hardest sort of pioneer contest with the wilderness. In all about 2,500 people lost their homes, with little insurance, for which the rates are almost prohibitive.

Dennison in Cleveland Plain Dealer.

"SAY JIMMY, LET'S TAKE DIS LOAD TO LIMPY BILL'S MUDDER.

The relief problem was complicated at Beaudette by a recent epidemic of typhoid, but prompt action by the State Board of Health, backed up by the militia, prevented a serious situation in this and other sanitary matters.

Liquor selling was promptly prohibited, but did not become effective until the guardsmen took possession of the international bridge over Rainy river from Canada to stop the smuggling of bottles.

REACHING THE SCATTERED FARMS

Relief and sanitary work in the villages was quickly put on an effective basis, but there were great difficulties to overcome in reaching the scattered homesteads. Mr. Bicknell reported:

> It was necessary to send expeditions in all directions to search for persons who might be sick or injured, to recover bodies, and to carry relief and medical supplies to those unable to reach relief centers. The wind and fire had blocked the forest roads with tangled masses of fallen trees. In one instance fifteen axemen, working day and night, were two days in reaching a small settlement twelve miles from Beaudette with a wagon load of supplies. Large numbers of horses, cows and other domestic animals had been killed by the fire and it became necessary to organize gangs of men to search for and bury them. The men of the community were pressed into service in the work of burying dead animals, clearing up the ruins, destroying infected outhouses and building new ones, unpacking and distributing supplies, etc. In most instances their services were given cheerfully, but in some cases it became necessary for the military authorities to compel men to help.
